This indicates that the people with over £500 a year were in 1920 distributed in income classes practically the same as in 1801. But if we look at the *amounts* of income in the classes, the results are rather different, for there was *relatively* a larger sum in the hands of the "over £5,000" class in 1920 than in 1801. He gave a table for incomes over £500:

	1801	1920
£ 500–£1,000	24·4	22·3
1,000– 2,000	23·2	21·8
2,000– 5,000	26·7	21·8
Over 5,000	25·7	34·1

This result is consistent with the following theoretical solution: The total nominal income increased much more than the total population—the increase surged upwards through all the fixed classes, so that there was in 1920 a smaller population in the ranks of the poorest, with a nominal income of say under £80 a year, and many more in the over £5,000 class, but the *slope* of distribution had hardly altered.

Let us examine this in the light of the total numbers and sums assessed. The population subjected to the tax law had increased not quite five times, but the people with incomes over £200 had increased on these tables 25 times, and their income 24 times; even if we suppose the old tables were only half the truth, there was in 1920 an increase in numbers and income of 12½ times, or 2½ times the rate of the increase in population. If we take those over £500, the numbers are 19 times, and the income 22 times as great, and halving these again, for precaution, we have, roughly, an increase at twice the rate of increase of the population.

Before and After the World War.—For a pre-war and post-war comparison, Bowley and Stamp computed that the proportion of the national income going to super-tax payers in 1911 has been estimated at 8 per cent. The super-tax limit was then £5,000. If allowance is made for the change in the value of money the comparable figure in 1924 was £9,500. The proportion of persons with incomes above this amount in 1924 was 5½ per cent. It would appear, therefore, that, measured by percentage, and allowing for the legal avoidance of super-tax, some ground has been lost by this section in the period of 13 years.

The following table is given to show the percentage of total income and individuals classified according to the source of income:

Source	Percentage of total income		Percentage of total individuals	
	1913–14	1922–23	1913–14	1922–23
Mines and manufactures	6·9	6·9	10·1	8·1
Distribution and transport	8·2	8·9	15·3	12·3
Professions, finance, etc.	8·3	5·1	12·1	11·0
Employments, directors' fees, etc.	4·3	7·8	35·5	39·2
Total	27·7	28·7	73·0	70·6

A British Official Estimate of Income Distribution.—The Board of Inland Revenue gave the Royal Commission on Income Tax (1920) a complete distribution table of the whole assessed income for 1919 amounting to 2,073 millions (subject to a considerable margin of error) as follows (revised in their 64th Annual Report, p. 112):—

Class of income		Actual income	Number of incomes
Exceeding	Not exceeding		
£	£	£	
130	160	488,887,960	3,490,000
160	200	355,250,000	2,031,400
200	250	165,000,000	751,700
250	300	110,700,000	411,000
300	400	126,206,191	372,900
400	500	78,890,000	180,000
500	600	58,696,107	108,700
600	700	47,904,000	74,850
700	800	44,696,000	60,400
800	900	40,022,000	47,640
900	1,000	36,583,000	38,920
1,000	1,500	118,088,285	98,430
1,500	2,000	75,554,431	44,440
2,000	2,500	54,701,849	24,870
2,500	5,000	130,030,000	37,760
5,000	10,000	114,870,000	16,720
10,000	15,000	58,650,000	4,850
15,000	20,000	35,005,000	2,043
20,000	25,000	22,022,000	992
25,000	30,000	17,680,000	650
30,000	40,000	23,471,000	685
40,000	50,000	17,333,000	390
50,000	75,000	21,467,000	358
75,000	100,000	11,782,000	137
100,000	..	33,090,000	165
Total of incomes £2,000 and over		540,701,849	89,620
Total of income distributed amongst individuals		2,287,179,823	7,800,000
Other income not so distributed		260,000,000	..
Grand total of incomes exceeding £130 a year		2,547,179,823	7,800,000

United States: Distribution of Income.—The distribution of national income in the United States has been computed for 1918 as follows:—

Income class	Actual distribution		Percentage distribution	
	Number '000	Amount $ million	Number	Amount
$				
Under zero	200	—125	·5324	·22
0– 500	1,828	685	4·86	1·18
500– 1,000	12,531	9,819	33·35	16·94
1,000– 1,500	12,408	15,206	33·26	26·40
1,500– 2,000	5,222	8,918	13·89	15·39
2,000– 3,000	3,065	7,314	8·15	12·62
3,000– 5,000	1,383	5,174	3·68	8·93
5,000– 10,000	587	3,937	1·56	6·79
10,000– 25,000	192	2,808	·5112	4·85
25,000– 50,000	42	1,399	·1094	2·41
50,000– 100,000	14	952	·0373	1·64
100,000– 200,000	5	672	·0132	1·16
200,000– 500,000	2	570	·0053	·98
500,000–1,000,000	·4	220	·0010	·38
1,000,000 and over	·2	316	·0004	·55
	37,569.6	57,955	100·0	100·0

In the year 1918, for which the best information exists, it is estimated that about 86 per cent of those who had earnings had incomes of less than $2,000 and 14 per cent more than $2,000. The former class took 60 per cent of the national income and the latter 40 per cent. It was estimated that the 5 per cent (of those having earnings) who received the largest incomes, had a share in the aggregate of 25 per cent, this share having declined from 33 per cent in 1913 to 1916. The National Bureau of Economic Research, working on rather scanty details, estimated that for

1918 the most prosperous 1 per cent of income receivers took 14 per cent of the total; the most prosperous 5 per cent took 26 per cent of the total, the most prosperous 10 per cent took 35 per cent of the total, and the most prosperous 20 per cent about 47 per cent of the total. Starting from the top of the income scale, in order to include one per cent of the income receivers, they had to go down to people receiving $8,000 a year. Similarly to include 5 per cent of the income receivers, they had to go down to $3,250; to include 10 per cent down to $2,350, and to include 20 per cent down to $750 approximately.

S.)

WEAPON: *see* ARMS AND ARMOUR; HALBERD, LANCE, SPEAR, SWORD, GUN, PISTOL, SMALL ARMS and ORDNANCE.

WEAPONS, PRIMITIVE. Among primitive peoples it is often impossible to say of any object whether it is a weapon of war or an implement of agriculture or the chase. Thus in Assam the knife or *dao* fells trees, kills animals, defends its owner against human aggression and takes heads for him. A bow and arrow, may be used for war or for hunting only. Instruments of war may be roughly classified as those of offence and defence.

Stones.—The earliest missiles which man or sub-man ever used were the untrimmed stick or stone, hand-thrown. (*For* BOW AND ARROW, BLOW-GUN, and the weapons of civilized peoples *see* separate articles). To give greater force and carrying-power to stones, devices such as the sling and the pellet-bow have been constructed. Of the slings used by far the most common is the *cord sling,* which is found sporadically throughout the world. It consists of a wide, short strip of material, which forms a pouch for holding the stone, to the ends of which one or more strings are fastened for grasping in the hand. The *pellet-bow,* a more elaborate contrivance found in India, and Farther India, is a bow, fitted with two strings; fixed between these, about half-way down, is a small pouch for holding the stone or clay pellet.

Throwing-sticks and Clubs.—The stick thrown by hand has also become a specialized weapon. As an object for piercing it has developed into the dart, javelin, spear and arrow; as an object for stunning or crushing into the throwing-stick and throwing-club. As an implement of the chase the throwing-stick was used in ancient Egypt and is still found in Abyssinia, India and among the Hopi of North America; as a weapon of war, however, the flat throwing-stick is practically confined to Australia, though two specimens have also been found in the island of Santo (New Hebrides, West Pacific). In Australia the fighting *boomerang* (*q.v.*) is rather long and narrow and curved within the plane of the flattened sides. It differs from the better known returning *boomerang,* which is of lighter build and curved out of the plane of the sides, which propeller-like twist gives it its returning powers. This latter is used exclusively for fowling or as a game. The Australian *waddy,* and the *ulas* of Fiji are throwing-clubs; the former has typically a flat triangular head, the latter is short with a spherical head and a handle carved to make the grip more sure. Other clubs are sometimes thrown without being specially designed for the purpose. The many-bladed throwing-knives of certain tribes in the Sudan, of those throughout the Congo basin and north to Lake Chad are metal derivatives of the African wooden throwing club.

Throwing-spears.—As to piercing missiles, such as darts, javelins and throwing spears, the variety is endless. The simplest are composed of a single piece of wood one end of which is pointed and often hardened in the fire. More usually there is a separate shaft and fore-shaft of which the latter is often heavily barbed by means of carving or the attachment of separate pieces of bone or wood. Heads of obsidian or other stone, bone and—especially in Africa—metal are often added. To give greater range to the throwing spear certain tribes use mechanical aids, of two main varieties, the *spear-thrower* and the *beckett.* The former, constructed of wood or bamboo, performs the function of an extra joint in the arm. The spear lies along the spear thrower, with its butt resting against a projecting peg, or, where the thrower is of bamboo, in the slight socket made by the septum of the node. This device is typical of Australia; it is also used in parts of New Guinea and in some of the islands of Micronesia, and was formerly used in Central and South America, whether in the chase or war is not clear. The Eskimo and tribes of the northwest coast of America also use it for discharging harpoons and fish-spears.

The *beckett* consists of a short length of cord with a knot at one end. It is wrapped once round the spear, the knot passing under the free end and being thereby kept in place. The free end of the cord is then wrapped round the index finger of the throwing hand. The resultant action when the spear is thrown is on the same principle as that of the sling, and the spear is given greater force in its flight than if thrown by hand, and is made to spin as it flies. For use in warfare the *beckett* appears to be restricted to Oceania, but as a toy it is found both in Australia and Europe. A similar contrivance was used by the soldiers of ancient Greece and Rome and also by some North African peoples who may well have borrowed it from them. It differs from the *beckett* in that the cord is attached to the spear and is not retained in the hand.

In East Africa an unusual form of spear-thrower is found. A shaft of wood terminating in a swollen head has this part hollowed out; into it is fitted the butt of the spear. The man then manipulates the thrower as though it were a part of the spear-shaft, but it does not leave his hand.

Bolas.—An unusual missile now used almost exclusively for hunting or as a game is the *bolas.* Among the Patagonians and the Gauchos of La Plata, who formerly used it in warfare, it is composed of three (less commonly two) balls of stone connected with each other at a common centre by thongs several feet long. One ball is usually smaller than the rest, and this is held while whirling the *bolas.* The aim is to entangle the victim in the thongs rather than to kill him. Among the Ho of Togoland, West Africa, a long cord with a stone attached at either end is similarly used for hindering an advancing enemy. Elsewhere a few tribes in Central and East Africa use the same instrument as a toy. The Eskimo uses a many-thonged *bolas* for catching birds.

Thrusting-spears and Clubs.—These are the most important weapons used in hand-to-hand fighting. The former are very similar to the throwing-spears, though usually heavier, and, since nicety of balance is not necessary more often made without a separate foreshaft. Many of them are heavily barbed as in the beautiful specimens found in Fiji. Clubs are of diverse kinds. Primarily they are for bruising or crushing, but some, such as the bird-headed clubs which are used in New Caledonia are well adapted for piercing. A distinction can also be made between those which are all of one piece and those having a head of different material from the shaft—usually of stone. Among those of the former type the business end is usually considerably thicker than the shaft and carved with spikes or rugosities (sometimes in imitation of its prototype the torn-up sapling) which make it more effective; but in the W. Pacific bat-shaped clubs, called by the early travellers "swords," are also found, though to-day they seem to be used more often for ceremonial than for military purposes. Clubs made entirely of any material other than wood are not very common, but the nephrite *mere* and bone *patu* of the Maoris are examples, and also the rhinoceros horn clubs of the Bechuana. These former are not only striking but also thrusting weapons, and are supplied with sharpened edges for the latter purpose.

Poisons.—The art of poisoning their weapons is known to many tribes. The poison is extracted from plants, as the upas tree in Indonesia, and also sometimes from reptiles and insects. In many parts of the world, however, weapons are said to be poisoned but are not, for deaths due to tetanus which so often followed wounds from these have frequently been mis-attributed to poison. The belief arose partly from the statements of the natives themselves, partly from the presence (in the West Pacific) of a green gummy substance at the base of the arrow or spear-heads. The latter is, however, only the vegetable cement fastening

head to foreshaft, while the former refer to the magical power supposed to be given the weapon by using human instead of animal bone for the head or barbs.

Primitive Armour.—With the exception of shields, weapons of defence are not common among primitive peoples, though some have armour of a sort. In New Guinea, a few tribes wear a body-covering of basket work, sometimes with a high back to protect the neck and head. In the Gilbert Islands, owing to the dearth of timber, native weapons of the ordinary kind are not found, but in their stead, slender spears and many pronged "swords" edged with sharks' teeth; as a protection against these, armour of coconut fibre is worn often covering the whole person, including the head. From West Africa and among the Baggara of the north-east occasional suits of chain mail have been recorded, probably the result of Arab influence. Plate armour is found in north-east Asia and on the north-west coast of America, and among the Haida cuirasses of wooden or bone slats are used, whose form is reminiscent of this. In Indonesia corselets of hide or basketry and wadded coats covered with feathers give protection, and helmets of cane or skin are also found in this area and in Indo-China, and Assam.

Shields.—Shields vary greatly in material and form. In Africa hide and basketry are much used, the former mainly in the east and south among the cattle-rearing people. In Indonesia, Australia and the Pacific region those of wood are more common, though basketry ones are also found. The Australian shields are small and light, suitable for parrying blows, and in this are similar to those of the Dinka and Mundu of the Sudan; elsewhere they are mostly for covering the most vital parts of the body. The shield is essentially the means of defence for those who use the club and spear and who fight mainly in the open. It is not convenient for a bow and arrow people, since it interferes with the free use of both hands. In New Guinea, however, this difficulty has been overcome. Among the Tapiro pygmies of Netherlands New Guinea a small shield is hung round the neck in a net bag in such a way as to protect the chest. Among the Gulf tribes of Papua a large wooden shield, which has in its upper edge a deep slot for the passage of the left arm, is suspended over the shoulder, so that a man can draw his bow while keeping covered the whole of his body which is towards the foe.

See Horniman Museum Handbook, *Weapons of War and of the Chase.* (C. H. W.)

WEAR, river, Durham, England, rising in the Pennine chain, and traversing a valley of 60 m. to the North Sea. Through a narrow and picturesque valley, the stream flows to Bishop Auckland, then meanders past the bold peninsula which bears the cathedral of Durham. Later the river becomes navigable, carrying a great traffic in coal, and having its banks lined with factories. At the mouth is Sunderland (*q.v.*).

WEASEL (*Putorius nivalis*), the smallest European species of the group of mammals of which the polecat and stoat are well-known members (*see* CARNIVORA). The weasel has an elongated slender body, head small and flattened, ears short and rounded, neck long and flexible, limbs short, five toes on each foot, all with sharp, compressed, curved claws, tail rather short, slender, cylindrical, and pointed at the tip, and fur short and close. The upper-parts are reddish brown, the under-parts white. In cold regions the weasel turns white in winter, but less regularly and at a lower temperature than the stoat, from which it is distinguished by its smaller size and the absence of the black tail-tip. The length of the head and body of the male is about 8in., that of the tail 2½in.; the female is smaller. The weasel is distributed throughout Europe and northern and central Asia; and is represented by closely allied animals in North America. It possesses all the active, courageous and bloodthirsty disposition of the rest of the genus. Mice, rats, water-rats, moles and frogs constitute its principal food. It can not only pursue its prey through holes and crevices and under dense herbage, but follow it up trees, or into the water, swimming with ease. It constructs a nest of dried leaves and herbage, placed in a hole in the ground or hollow tree, in which it brings up its litter of four to six young ones. The mother will defend her young with the utmost desperation. Instances are known of weasels being met with in packs, and then occasionally attacking human beings.

Among the American species may be mentioned the long-tailed weasel (*P. novaboracensis*) of eastern U.S.A., which is chocolate-brown above and turns white in winter. The short-tailed weasel (*P. cicognani*) is about 5in. shorter than the last and is darker in summer. It inhabits Canada and northern U.S.A. and the fur is an important source of ermine.

WEATHER: *see* METEOROLOGY.

WEATHERFORD, a city of Texas, U.S.A. Pop. 6,203 in 1920, 94% native white, estimated at 7,500 in 1928. It is the seat of a junior college (Methodist Episcopal). The city operates under a commission. The town was incorporated in 1878.

WEATHERING, in architecture, the sloping surface on the upper side of a coping, projecting moulding or band course, arranged so as to throw off rain water, known as wash. The expression "to the weather" is used to describe the length of a slate exposed below the edge of the next lapping course.

WEAVER, JAMES BAIRD (1833–1912), American lawyer and political leader, was born at Dayton (O.), on June 12, 1833. He studied law at Cincinnati (O.), and served on the Union side in the Civil War. In March 1865 he was breveted brigadier general of volunteers. He was a representative in Congress in 1879–81 and in 1885–89, being elected by a Greenback-Democratic fusion. In 1880 he was the candidate of the Greenback party for president, and received a popular vote of 308,578; and in 1892 he was the candidate of the People's party, and received 22 electoral votes and a popular vote of 1,041,021. He died at Des Moines (Ia.), on Feb. 6, 1912.

WEAVER-BIRD, the name by which a family (*Ploceidae*) of birds are usually known, from their often elaborately interwoven nests. They are small sparrow-like birds, but the males are often conspicuously coloured. Perhaps the most remarkable is the African sociable grosbeak (*Philhetaurus socius*); some 100 or 200 pairs build their grass nests together in one tree, forming a gigantic mushroom-shaped mass. Each nest is entered from below. The subfamily of the widow-birds (*Viduinae*) have long tail-feathers, reaching in *Vidua paradisea,* a bird the size of a sparrow, a foot in length. This decoration is confined to the males. The *Ploceidae* are closely related to the *Fringillidae* (*see* FINCH), and are distributed over Africa, Australia and the warmer parts of Asia.

WEAVING. The process of weaving consists in interlacing, at right angles, two or more series of flexible materials, of which the longitudinal are called warp and the transverse weft. Weaving, therefore, embraces only one section of the textile industry, for felted, plaited, netted, hosiery and lace fabrics lie outside this definition. Felting consists in bringing masses of loose fibres, such as wool and hair, under the combined influences of heat, moisture and friction, when they become firmly interlocked in every direction. Plaited fabrics have only one series of threads interlaced, and those at other than right angles. In nets all threads are held in their appointed places by knots, which are tied wherever one thread intersects another. Hosiery fabrics, whether made from one or many threads, are held together by intersecting a series of loops; while lace fabrics are formed by passing one set of threads between and round small groups of a second set of threads, instead of moving them from side to side.

The invention of spinning (*q.v.*) gave a great impetus to the introduction of varied effects; previously the use of multi-coloured threads provided ornament for simple structures, but the demand for variety extended far beyond the limits of colour, and different materials were employed either separately or conjointly, together with different schemes of interlacing. Eventually the weaver was called upon to furnish articles possessing lustre, softness and delicacy; or those that combine strength and durability with diverse colourings, with a snowy whiteness, or with elaborate ornamentation. To meet the requirements the world has been searched for raw materials. From the animal kingdom, wool, hair, fur, feathers, silk and the pinna fibre have long been procured. From the vegetable kingdom, cotton, flax, hemp, jute, ramie and a host of other less known materials are derived. Amongst minerals there are

gold, silver, copper, brass, iron, glass and asbestos. In addition, strips of paper, or skin, in the plain, gilt, silvered and painted conditions are available. Finally, artificial fibres are used, especially artificial silk, which has come into very extended use.

The processes of bleaching (*q.v.*), mercerizing (*q.v.*), dyeing (*q.v.*), printing (*see* TEXTILE PRINTING) and finishing (*q.v.*) contribute to the resultant product.

FABRIC STRUCTURE AND DESIGNING

The following classification will be adopted: Group 1, to include all fabrics made from one warp and one weft, provided both sets of threads remain parallel in the finished article and are intersected to give the requisite feel and appearance. Group 2, to include (*a*) fabrics constructed from two warps and one weft, or two wefts and one warp, as in those that are backed, reversible and figured with extra material; (*b*) two or more distinct fabrics built simultaneously from two or more warps and wefts, as in two, three and other ply cloths; (*c*) fabrics built by so intersecting two or more warps and wefts that only one texture results, as in loom-made tapestries and figured repps. Group 3, to include fabrics in which a portion of the weft or warp rises vertically from the ground-work of a finished piece, as in velveteens, velvets, plushes and piled carpets. Group 4, to embrace all fabrics in which one portion of the warp is twisted partially, or wholly, round another portion, as in gauzes and lappet cloths.

The structure of a cloth, and its ornamentation by weaving, is worked out by the cloth designer on squared paper. Successive vertical lines of squares are taken to represent the warp threads, whilst horizontal lines similarly represent weft threads. A filled-in square then indicates that the warp thread it represents is above the weft, whereas a blank means weft above warp. This can be seen clearly in fig. 1. When two or more warps or wefts are used in a cloth, different colours or kinds of marks are generally used to show the working of the different warps or wefts. Thus, in fig. 15 the crosses represent ground warp above ground weft, whereas the filled squares show ground warp above the extra or figuring weft.

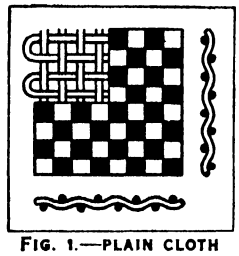

FIG. 1.—PLAIN CLOTH

Fabrics in Group 1.—These are affected by the nature and closeness of the yarns employed in their construction, by colour, or by the scheme of intersecting the threads. The most important section of this group is *Plain cloth*, in which the warp and weft threads are approximately equal in thickness and closeness, and pass over and under each other alternately, as in fig. 1, which shows a design, plan and two sections of plain cloth. Such a fabric would, therefore, appear to admit of but slight ornamentation, yet this is by no means the case, for if thick and thin threads of warp and weft alternate the resultant fabric may be made to assume a corrugated appearance on the face, while beneath it remains flat, as in poplins, repps and cords. A plan and a longitudinal section of a repp cloth are shown in fig. 2. Colour may also be employed to ornament plain fabrics, and its simplest application produces stripes and checks. But colour may convert these fabrics into the most artistic productions. Tapestries only differ from simple plain cloth in having each horizontal line of weft made up of numerous short lengths of parti-coloured thread. Many fine specimens of this art have been recovered from ancient Egyptian and Peruvian tombs, and many are still produced in the Gobelins and manufactories of Europe.

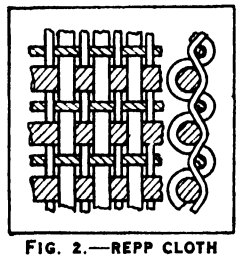

FIG. 2.—REPP CLOTH

Twills are next in importance to plain cloth on account of their wide range of application and great variety of effects; in elaborately figured goods their use is as extensive as where they provide the only ornament. Twills invariably form diagonal ribs in fabrics, and these are due to the intervals at which the warp and weft are intersected; thus two or more warp threads are passed over or under one or more than one weft thread in regular succession. Twills are said to be equal when similar quantities of warp and weft are upon the face of a fabric, unequal when one set of threads greatly preponderates over the other set. Fig. 3 shows the design for an equal, and fig. 4 that for an unequal twill, each of which requires four warp and weft threads to complete the scheme of intersections. If the ribs form angles of 45 degrees, the warp and weft threads per inch are about equal in number, but for an unequal twill the material most in evidence should be closest and finest. The angle formed may be greater or less than 45 degrees, as in figs. 5, 6, which are both derived as shown from the same base weave. Twills are *simple* and *fancy;* both terms refer to the schemes of intersecting. In the former the same number of warp threads are placed successively above or below each weft thread, and the ribs are of uniform width, as in figs. 3, 4. In the latter more warp threads may be above one pick than another, the ribs may vary in width and small ornament may be introduced between the ribs, as in figs. 5, 6 and 7. Twills may be broken up into zig-zags, lozenges, squares and other geometrical designs, all of which may be produced by reversings in the diagonal lines, or by reversing the weave of an unequal twill. Fig. 8 is a zigzag, namely, a twill reversed in one direction. Fig. 9 is a diamond, or a twill reversed in two directions, and fig. 10 is a diaper, which gives a warp face in one place and a weft face in another.

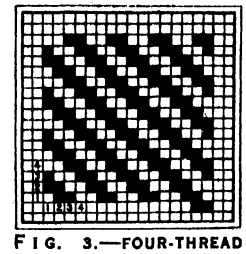

FIG. 3.—FOUR-THREAD ¾ TWILL

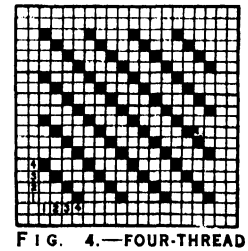

FIG. 4.—FOUR-THREAD ¾ TWILL

Satins and *sateens* form another important section of Group 1. In a satin the bulk of the warp, and in a sateen the bulk of the weft, is on the face of a fabric. If perfect in construction both present a smooth, patternless appearance, which is due in part to the scheme of intersections, in part to using fine material for the surface threads and placing it close enough together to render the points of intersection invisible; the threads of the other set being coarser and fewer in number. Satins differ from twills in having each warp thread lifted, or depressed, separately, but not successively. From five to upwards of 30 threads of warp and weft are required to complete the various schemes of intersecting. If the intervals between the intersections are equal the weave is said to be perfect, as in fig. 11, but if the intervals are irregular it is said to be imperfect, as in fig. 12. In *Damasks* a satin is combined with a sateen weave, and since any desired size and shape of either weave may be produced, great facilities are offered for ornamentation. But in combination neither the satin nor the sateen can be perfect in construction, for one requires a preponderance of warp, the other a preponderance of weft; it follows that every point of intersection is distinctly visible on both surfaces.

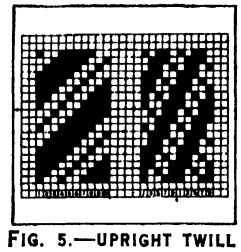

FIG. 5.—UPRIGHT TWILL

Brocades are fabrics in which both sets of threads may be floated irregularly upon the surface to produce ornamental effects, and they may be taken as typical of all one warp and one weft fabrics that are figured by irregularly floated materials, whether the threads are uniformly or irregularly distributed, and whether one weave or several weaves be employed.

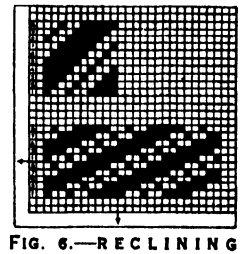

FIG. 6.—RECLINING TWILL

Group 2.—This group includes all backed and reversible fabrics, as well as those ornamented with extra material and compounded. Cloths intended for men's wear are often *backed,* the object of which is to give weight and bulk to a thin texture without interfering with the face effects. Either warp or weft may be used as backing; in

the former there are two series of warp to one series of weft threads, while in the latter there are two series of weft to one series of warp threads. The face material is superposed upon that of the back, but the ratio of face threads may be one or two to one of back. In order to avoid disturbing the face weave, only those threads are used to bind the backing that are hidden by the face, as in fig. 13, which gives the design and a transverse section of a backed fabric. A is face weft, B back weft, and the circles are warp threads; of the latter C, D are beneath both B and A. This diagram will serve equally as a longitudinal section of a warp-backed fabric, if A represents a thread of face warp, B a thread of back warp and the circles are weft threads. Weft backing is capable of giving a more spongy feel to a fabric than warp, because softer materials may be used, but in these fabrics the length output of the loom is reduced by reason of the wefts being superposed. Warp-backed fabrics, whether uniformly coloured or striped, do not materially reduce the output of a loom, for every weft thread adds to the cloth length. *Reversible* fabrics may have either two series of differently coloured wefts or warps to one of the other series, in which event they may be similarly figured on both sides by causing the threads of the double series to change places, as in the design and transverse section, fig. 14; or, by allowing one series to remain constantly above the other, as in backed cloths, both sides may be similar or dissimilar in colour and pattern. *Fabrics figured with extra material* may have two series of warp or weft threads to one series of the other set, and they may yield reversible or one-sided cloths. The figuring may be done entirely by the extra material placed above or below a ground texture, as in fig. 15, or ordinary and extra materials may be used conjointly for figuring. In fig. 15 the waved lines and circles represent a section of the plain cloth ground which shows a thread of extra material. *Compound cloths* must have at least two textures, both as distinct in character as if woven in separate looms. They have many advantages over backed cloths, thus: the same design and colouring may be produced on both sides; where bulk and weight are required a fine surface texture may be formed over a ground of inferior material, and soft weft be passed between the upper and lower textures; the fabric is more perfect and admits of either simple or elaborate patterns being wrought upon the surface, with simple ones beneath, as in piqués and matelassés. One texture may be constantly above the other and connected at the selvages only, as in hose pipes and pillow slips; or at intervals a thread may pass from one texture into the other, in which event both are united, as in many styles of bedcovers and vestings. As many as from three to twelve textures may be woven simultaneously and united, as in woven beltings. It differently coloured, the textures may change places at pleasure, as in Kidderminster carpets. There may be from one to three threads of face warp to one of back, and the wefting may or may not correspond with the warping. Fig. 16 shows the face and back weaves, the design, and a transverse section of a compound cloth with two threads of face warp and weft to one of back, and both

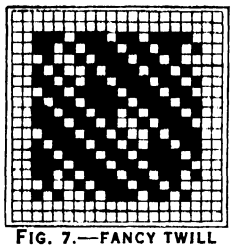

FIG. 7.—FANCY TWILL

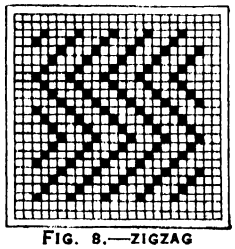

FIG. 8.—ZIGZAG

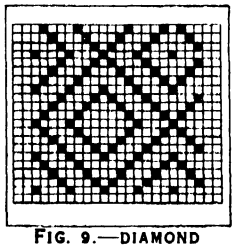

FIG. 9.—DIAMOND

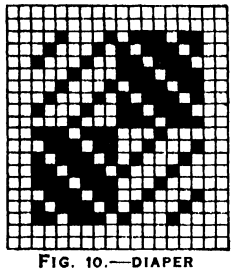

FIG. 10.—DIAPER

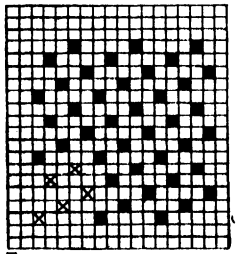

FIG. 11.—FIVE-THREAD SATEEN

are stitched together. The circles in the upper and lower lines represent face and back warps respectively, and A, B, C are weft threads placed in the upper and lower textures. In the design, filled squares show face warp lifted above face picks, crosses show back warp lifted over back picks, dots indicate face warp lifted over back picks, and the oblique marks show the binding of the two fabrics by back warp lifted over a face pick. *Loom-made tapestries and figured repps* form another section of Group 2. As compared with true tapestries, the loom-made articles have more limited colour schemes, and their figured effects may be obtained from warp as well as weft, whether interlaced to form a plain face or left floating more or less loosely. Every weft thread, in passing from selvage to selvage, is taken to the surface where required, the other portions being bound at the back. Some specimens are reversible, others are one-sided, but, however numerous the warps and wefts, only one texture is produced. When an extra warp of fine material is used to bind the wefts firmly together a plain or twill weave shows on both sides. If a single warp is employed, two or more wefts form the figure, and the warp seldom floats upon the surface. Where warps do assist to form figure it rarely happens that more than three can be used without overcrowding the reed. Fig. 17 gives the design, and a transverse section of a reversible tapestry in four colours, two of which are warps and two wefts. If either warp or weft is on the surface, corresponding threads are beneath. The bent lines represent weft and the circles warp. In this design the marks indicate the colours showing on the surface of the cloth, and *not* the lifting of the warp. Thus, crosses show No. 1 warp on the surface, filled squares show No. 2 warp, dots show No. 1 weft and oblique marks No. 2 weft on the face of the fabric. Each vertical line of squares represents one thread of each warp and each horizontal line represents one thread of each weft. *Figured repps* differ from plain ones in having threads of one, or more than one, thick warp floated over thick and thin weft alike; or in having several differently coloured warps from which a fixed number of threads are lifted over each thick weft thread; the figure is due to colour.

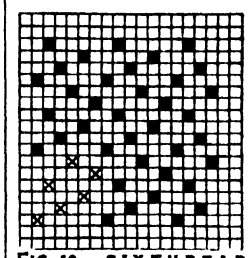

FIG. 12.—SIX-THREAD SATEEN

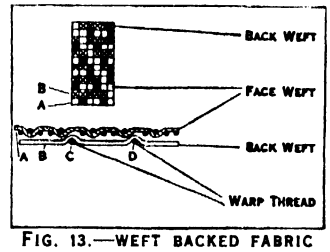

FIG. 13.—WEFT BACKED FABRIC

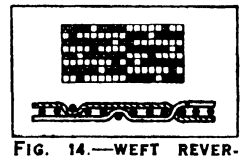

FIG. 14.—WEFT REVERSIBLE FABRIC

Group 3. Piled Fabrics.—In all methods of weaving hitherto dealt with the warp and weft threads have been laid in longitudinal and transverse parallel lines. In piled fabrics, however, portions of the weft or warp assume a position at right angles to the surface of the cloth. If the former there are two series of weft threads, one being intersected with the warp to form a firm ground texture, the other being bound into the ground at regular intervals, as in the design and transverse section of a velveteen, fig. 18; the circles and waved lines form plain cloth, and the loose thread A is a pile pick. After leaving the loom all threads A are cut by pushing a knife lengthwise between the plain cloth and the pile. As each pick is severed both pieces rise vertically and the fibres open out as at B. Since the pile threads are from two to six times as numerous as those of the ground, and rise from an immense number of places, a uniform brush-like surface is formed. Raised figures are produced by carrying the threads A beneath the ground cloth, where no figure is required, so that the

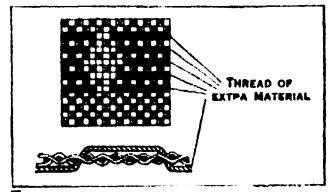

FIG. 15.—FIGURING WITH EXTRA WEFT

knife shall only cut those portions of the pile weft that remain on the surface. The effect upon the face varies with the distribution of the binding points, and the length of pile is determined by the distance separating one point from another. When *chenille* is used in the construction of figured weft-pile fabrics, it is necessary to employ two weaving operations, namely, one to furnish the chenille, the other to place it in the final fabric. Chenille is made from groups of warp threads that are separated from each other by considerable intervals; then, multi-coloured wefts are passed from side to side in accordance with a predetermined scheme. This fabric is next cut midway between the groups of warp into longitudinal strips, and, if reversible fabrics such as table-covers and curtains are required, each strip is twisted axially until the protruding ends of weft radiate from the core of warp, and form a cylinder of pile. In the second weaving this chenille is folded backward and forward in a second warp to lay the colours in their appointed places and pile projects on both sides of the fabric. If chenille is intended for carpets, the ends of pile weft are bent in one direction and then woven into the upper surface of a strong ground texture. *Warp-piled fabrics* have at least two series of warp threads to one of weft, and are more varied in structure than weft-piled fabrics, because they may be either plain or figured, and have their surfaces cut, looped or both. *Velvets and plushes* are woven single and double. In the former case both ground and pile warps are intersected with the weft, but at intervals of two or three picks the pile threads are lifted over a wire, which is subsequently withdrawn; if the wire is furnished with a knife at its outer extremity, in withdrawing it the pile threads are cut, but if the wire is pointed a line of loops remains, as in terry velvet. Fig. 19 is the design and two longitudinal sections of a Utrecht velvet. The circles are weft threads, and the bent line is a pile thread, part of which is shown cut, another part being looped over a wire. The circles are repeated to show how the ground warp intersects the weft. In the design the filled squares show the pile warp lifted over the wires. *Double plushes* consist of two distinct ground textures which are kept far enough apart to ensure the requisite length of pile. As weaving proceeds the pile threads are interlaced with each series of weft threads, and passed from one to the other. The uniting pile material is next severed midway between the upper and lower textures, and two equal fabrics result. Fig. 20 gives three longitudinal sections of a double pile fabric. The circles A, B are weft threads in the upper and lower fabrics respectively; the lines that interlace with these wefts are pile warp threads which pass vertically from one fabric to the other. At C, D the circles are repeated to show how the ground warps intersect the wefts, and at E the arrows indicate the cutting point. *Figured warp-pile fabrics* are made with regular and irregular cut and looped surfaces. If regular, the effect is due to colour, and this again may be accomplished in various ways, such as (*a*) by knotting tufts of coloured threads upon a warp, as in Eastern carpets; (*b*) by printing a fabric after it leaves the loom; (*c*) by printing each pile thread before placing it in a loom, so that a pattern shall be formed simultaneously with a pile surface, as in tapestry carpets; (*d*) by providing several sets of pile threads, no two of which are similar in colour; then, if five sets are available, one-fifth of all the pile warp must be lifted over each wire, but any one of five colours may be selected at any place, as in Brussels and Wilton carpets. Fig. 21 is a longitudinal section of a Brussels carpet. The circles represent two tiers of weft, and the lines of pile threads, when not lifted over a wire to form loops, are laid between the wefts; the ground warp interlaces with the weft to bind the whole together. When the surface of a piled fabric is irregular, also when cut and looped pile are used in combination, design is no longer dependent upon colour, for in the former case pile threads are only lifted over wires where required, at other places a flat texture is formed. In the latter case the entire surface of a fabric is covered with pile, but if the figure is cut and the ground looped the pattern will be distinct.

Group 4. Crossed Weaving.—This group includes all fabrics, such as gauzes, in which the warp threads intertwist amongst themselves to give intermediate effects between ordinary weaving and lace. Also those, such as Lappets, in which some warp threads are laid transversely in a piece to imitate embroidery. *Plain gauze* embodies the principles that underlie the construction of all crossed woven textiles. In these fabrics the twisting of two warp threads together leaves large interstices between both warp and weft. But although light and open in texture, gauze fabrics are the firmest that can be made from a given quantity and quality of material. One warp thread from each pair is made to cross the other at every pick, to the right and to the left alternately, therefore the same threads are above every pick, but since in crossing from side to side they pass below the remaining threads, all are bound securely together, as in fig. 22, which shows a longitudinal section and also a plan of gauze. *Leno* is a muslin composed of an odd number of picks of a plain weave followed by one pick of gauze. In texture it is heavier than gauze, and the cracks are farther apart transversely. *Fancy gauze* may be made in many ways, such as (*a*) by using crossing threads that differ in colour or count from the remaining threads, provided they are subjected to slight tensile strain; (*b*) by causing some to twist to the right, others to the left simultaneously; (*c*) by combining gauze with another weave, as plain, twill, satin, brocade or pile;

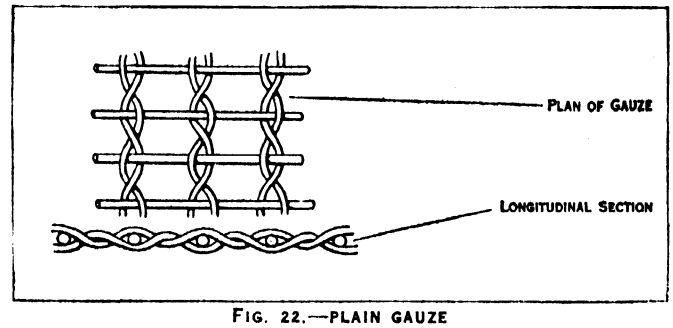

FIG. 22.—PLAIN GAUZE

(*d*) by varying the number of threads that cross, and by causing those threads to entwine several ordinary threads; (*e*) by passing two or more weft threads into each crossing, and operating any assortment of crossing threads at pleasure.

Lappet weaving consists in diapering the surface of a plain or gauze fabric with simple figures. This is done by drawing certain warp threads into a transverse position and then lifting them over a thread of weft to fix them in the texture, after which they are moved in the opposite direction and lifted over the following pick, the cloth being generally woven with the face side down. The material between one binding point and another must float loosely, and this limits the usefulness of lappet figuring. In fig. 23 the thick lines show a lappet spot upon a plain texture.

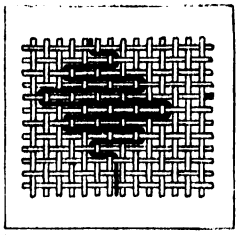

FIG. 23.—LAPPET FABRIC

Notwithstanding diverse structure, intricate machines are not essential to the production of either simple or complex textures; the most elaborate and beautiful specimens of the weaver's art have been manufactured upon simple machinery.

WEAVING MACHINERY

The longitudinal threads of a fabric are called warp, caine, twist and organzine, and the transverse threads are weft, shoot, woof, filling and tram. A loom for weaving these threads into cloth must provide for: (1) Shedding, *i.e.*, raising and lowering the warp threads in a predetermined sequence so as to form two lines between which the weft may be passed. (2) Picking, or placing lines of weft between the divided warp. (3) Beating-up, or striking each weft thread into its appointed position in the fabric. (4) Letting-off, or holding the warp tense and delivering it as weaving proceeds. (5) Taking-up, or drawing away the cloth as manufactured. (6) Temples, for stretching the fabric widthwise in order to prevent the edge threads of a warp from injuring the reed, and from breaking. Fig. 24 illustrates these operations. Shedding is generally done by controlling the warp threads by eyed healds, which are lifted or lowered to form the shed. The weft is inserted by the shuttle after the shed has been formed, and beating-up is done by the reed which is moved forward by the slay or batten. Intermittently driven rollers take up the cloth and a frictional drag, applied to the warp beam by a weighted rope or chain, regulates the let-off and warp tension. Power looms require the above-named contrivances to act automatically; and, in addition, (7) a weft-fork, to stop the loom when the weft

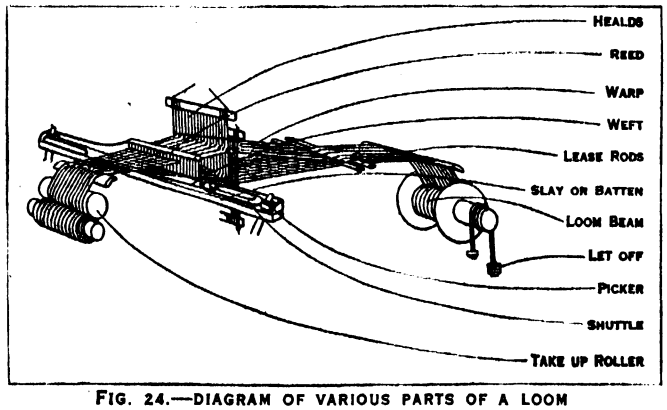

FIG. 24.—DIAGRAM OF VARIOUS PARTS OF A LOOM

becomes exhausted or breaks. (8) Mechanism for stopping the loom when the shuttle fails to reach its appointed box. (9) For weaving cross stripes, multiple shuttle boxes are needed to bring different colours, or counts of weft, into use at the proper time. (10) In some looms a device for automatically ejecting a spent cop, pirn or shuttle, and inserting a full one is requisite. (11) If a weaver has to attend to a greater number of looms than usual, a device for stopping the loom when a warp thread fails is essential. In addition to the loom itself, weaving machinery includes preparatory machines required to get the warp and sometimes the weft threads ready for the loom. Warp thread—or rather yarn—generally requires re-winding from the spinning frame bobbins or cops on to larger bobbins; warping a number of these yarns side by side on to a beam or into an untwisted rope; sizing the yarn to lay projecting fibres and to strengthen the

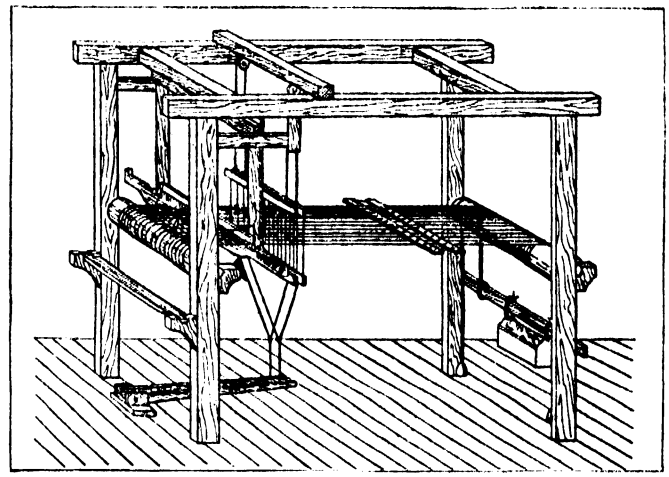

FIG. 25.—DIAGRAM OF HAND LOOM

yarn for weaving; finally, winding the sized yarn on to the loom beam and getting it ready for weaving in the loom.

The Hand-loom.—During the 17th and the first half of the 18th century it was observed that wherever any branch of the textile industry had been carried to a high state of excellence the looms used to manufacture a given fabric were similar in essentials, although in structural details they differed greatly. Prior to the invention of the fly shuttle by John Kay, in 1733, no far-reaching invention had for generations been applied to the hand-loom, and subsequently the Jacquard machine and multiple shuttle boxes represent the chief changes. A hand-loom as used in Europe at the present time (*see* fig. 25) has the warp coiled evenly upon a beam whose gudgeons are laid in open steps formed in the loom framing. Two ropes are coiled round this beam, and weighted to prevent the warp from being given off too freely. From the beam the threads pass alternately over and under two lease rods, then separately through the eyes of the shedding harness, in pairs between the dents of a reed, and finally they are attached to a cloth roller. For small patterns healds are used to form sheds, but for large ones a Jacquard machine is required. Healds may be made of twine, of wire or of twine loops into which metal eyes, called mails, are threaded. But they usually consist of a number of strings which are secured above and below upon wooden laths called shafts, and each string is knotted near the middle to form a small eye. From two to 24 pairs of shafts may be employed, but the healds they carry must collectively

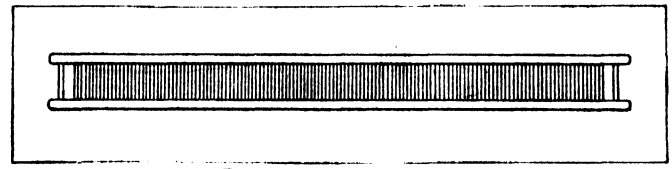

FIG. 26.—WEAVER'S REED

The warp threads are passed, generally in pairs or threes, through the dents or spaces between the reed wires

equal the number of threads in the warp. These healds will be equally or unequally distributed upon the shafts according to the nature of the pattern to be woven, and the threads will be drawn through the eyes in a predetermined order. The upper shafts are suspended from pulleys or levers, and the lower ones are attached directly or indirectly to treadles placed near the floor. The weaver depresses these treadles with his feet in a sequence suited to the pattern and the scheme of drawing the warp through the healds. When the treadle is pressed down, at least one pair of shafts will be lifted above the others, and the warp threads will ascend or descend with the healds to form a shed for the shuttle to be

passed through (*see* SHUTTLE). The reed (fig. 26) is the instrument by which weft is beaten into position in the cloth; it also determines the closeness of the warp threads, and guides a moving shuttle from side to side. It is made by placing strips of flattened wire between two half round ribs of wood, and binding the whole together by passing tarred twine between the wires and round the ribs. Such a reed is placed in the lower portion of a batten, which is suspended from the upper framework of the loom. In front of the reed, and immediately below the warp, the projecting batten forms a race for the shuttle to travel upon from side to side. Before Kay's invention a shuttle was thrown between the divided warp and caught at the opposite selvage, but Kay continued the projecting batten on both sides of the warp space and constructed boxes at each end. Over each box he mounted a spindle and upon it a driver, or picker. Bands connected both pickers to a stick which the weaver held in his right hand, while with the left hand he controlled the batten. A treadle is pressed down by one foot to form a shed; the batten is pushed back till a sufficient portion of the shed is brought in front of the reed and the depressed threads lie upon the shuttle race; a clear way is thus provided for the shuttle. A quick movement of the stick tightens the cord attached to a picker and projects the shuttle from one box to the other. The batten is now drawn

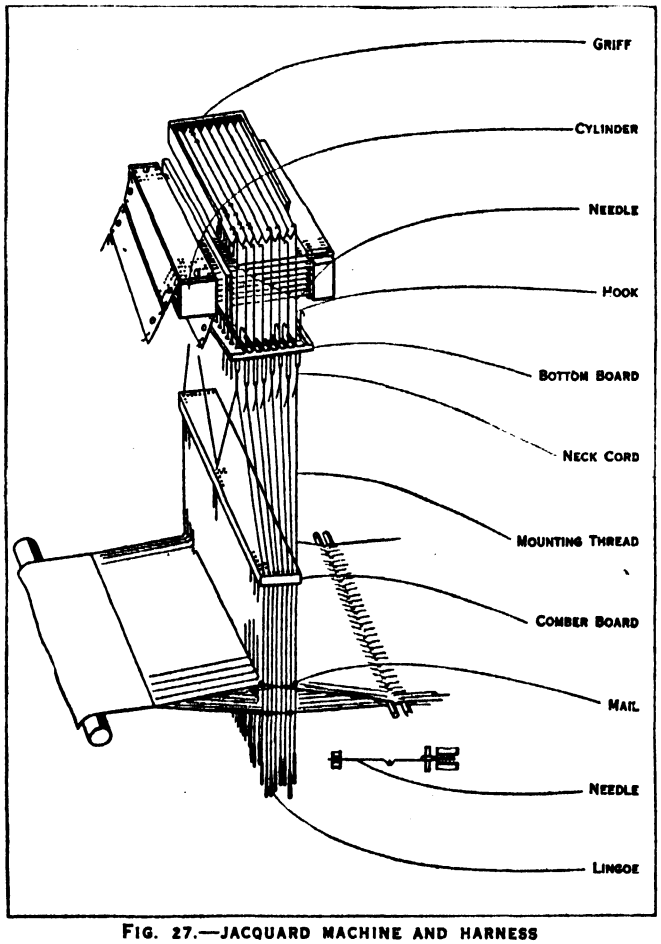

FIG. 27.—JACQUARD MACHINE AND HARNESS
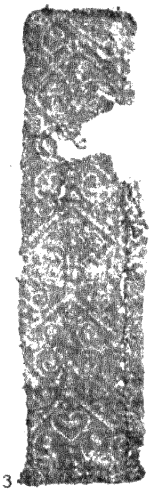
This method of shedding is required for the production of all fabrics ornamented by woven floral designs

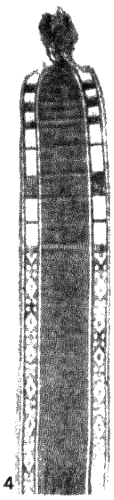
forward, and the reed beats up the weft left by the shuttle. As the next treadle is depressed to form another division of the warp for the return movement of the shuttle, the last length of weft is enwrapped between intersecting warp threads, and the remaining movements follow in regular succession.

In cases where the weft forms parti-coloured stripes across a fabric, also where different counts of weft are used, shuttles, equal in number to the colours, counts or materials, must be provided. By Robert Kay's invention of multiple shuttle boxes, in 1760, much of the time lost through changing shuttles by hand was prevented. His drop boxes consist of trays formed in tiers and fitted into the ordinary shuttle boxes. Each tray is capable of holding a shuttle, and by operating a lever and plug with the forefinger and thumb of the left hand the trays may be raised and lowered at pleasure to bring that shuttle containing the colour next needed into line with the picker.

The Draw Loom.—Large figured effects were formerly produced in draw looms, where the warp threads were so controlled by separate strings that any assortment could be lifted when required. To the lower end of each string a dead weight, called a lingoe, was attached, and a few inches above the lingoe a mail was fixed for the control of a warp thread. The strings passed through a comber board which held the mails and warp threads facing the proper reed dents. Still higher up, groups of strings were connected to neck cords; each group consisted of all strings required to rise and fall together constantly. If, for example, in the breadth of a fabric there were 12 repeats of a design, 12 strings would be tied to the same neck cord, but taken to their respective places in the comber board. These parts of a draw loom harness are clearly shown in fig. 27 which represents a Jacquard machine and harness. Each neck cord, after being led through the perforated bottom board and over a grooved pulley, was threaded through a ring on the top of a vertical cord called the simple, and passed horizontally to, and tied upon, a bar rigidly fixed near the ceiling of the weaving room. The simple cords were similarly attached to a bar placed near the floor. From one hundred to several thousands of neck and simple cords could be used in one harness. The design to be reproduced in cloth was read into the parallel lines of the simple by looping a piece of string round each cord that governed warp threads to be lifted for a given shed; after which all the loops were bunched together. By pulling at a bunch of loops the simple cords were deflected and they caused all warp threads controlled by them to be lifted above the level of those undisturbed. Similar bunches of loops were formed for every shed required for one repeat of a design, and they were pulled in succession by the draw-boy, while the weaver attended to the batten and picking.



The Jacquard Machine.—This is the most important invention ever applied to the hand-loom, but it is not the work of one man; it represents the efforts of several inventors whose labours extended over three-quarters of a century. This apparatus has taken the places of the simple, the loops, the pulleys and the draw-boy of the older shedding motion, but other parts of the harness remain unchanged. In 1725 Basile Bouchon substituted for the bunches of looped string an endless band of perforated paper by which the simples for any shed could be selected. In 1728 M. Falcon constructed the machine since known as the Jacquard and operated it through the medium of perforated cards, but it was attached to the simple cords and required a draw-boy to manipulate it. In 1745 Jacques de Vaucanson united in one machine Bouchon's band of paper and the mechanism of Falcon. He placed this machine where the pulley box previously stood, and invented mechanism for operating it from one centre.



In a Jacquard machine the warp threads are raised by rows of upright wires called hooks (fig. 27). These are bent at both extremities and are normally supported upon a bottom board which is perforated to permit the neck cords from the harness beneath to be attached to the hooks. Each of a series of horizontal needles—one of which is shown enlarged and detached at the foot of the drawing—is provided with a loop and a crank; the former to permit of a to-and-fro movement, the latter to receive a hook. The straight ends of the needles protrude about one-quarter of an inch through a perforated needle board, but the looped ends rest upon bars placed in tiers. A wire passed through all the loops of the needles which form one vertical line limits the extent of their lateral movement, and small helical springs impinge upon the loops of the needles with sufficient force to press them and their hooks forward. A frame called a griff, is made to rise and fall vertically by a treadle which the weaver actuates with one foot. This frame contains a blade for each line of hooks, and when the blades are in their lowest position the hooks are free and vertical with their heads immediately over

SPECIMENS OF ANCIENT WEAVING

1. Fragment of fabric woven by the Incas. Taken from a grave in Pachacamac, Peru. 2 Portion of the silk wrapping of tomb of Charlemagne with fanciful elephant and sacred tree device in a roundel. Possibly of Baghdad manufacture, 9th century. 3. Syrian or Anatolian silk weaving of the 5th century depicting Samson slaying the lion. 4. Inca woven fabric with figures of persons. Discovered in an ancient grave in Ancon, Peru. 5. Syrian or Persian silk weaving of the 5th century, showing mounted hunters engaged in the chase. 6. Syrian and Coptic flax weaving of the 5th or 6th century. Discovered at Akhmin, upper Egypt. 7. Long narrow strip of Inca fabric with typical design found in a grave in the Nasca valley. 8. A wider strip of Inca woven fabric that was also discovered in one of the Nasca valley graves

the blades, hence an upward movement given to the griff would lift all the hooks and thereby all the warp threads. Only certain hooks, however, must be lifted with the griff, and the selection is made by a quadrangular block of wood, called a cylinder, and cards which are placed upon it. Each face of the cylinder has a perforation opposite each needle, so that if the cylinder be pressed close to the needle board the needle points will enter the holes in the cylinder and remain undisturbed. But if a card, which is not perforated in every possible place, is interposed between the cylinder and the needles, the unpunctured parts of the card close up some of the holes in the cylinder and prevent corresponding needles from entering them. Each needle so arrested is thrust back by the advancing card; its spiral spring is contracted and its hook is tilted. If at this instant the griff ascends, its blades will engage the heads of all vertical hooks and lift them, but those that are tilted will remain unlifted. So soon as the pressing force of a card is removed from the needles the springs restore both needles and hooks to their normal positions. Cards are perforated by special machinery from a painted design, after which they are laced into a chain and passed over conical pegs upon the cylinder; the number required to weave any pattern equals the number of weft threads in that pattern. The cylinder is generally drawn out and turned by each upward movement of the griff, and restored to the needles by each downward movement, so that each face in succession is presented to the needles, and each rotatory movement brings forward a fresh card. As the griffe rises with vertical hooks a shed is formed, and a thread of weft is passed across the warp. The griff then descends and the operation is repeated but with a new combination of lifted threads for each card. A Jacquard may contain from 100 to 1,200 hooks and needles, and two or more machines may be mounted upon the same loom.

The Power-loom.—Little is known of the attempts made before the beginning of the 17th century to control all parts of a loom from one centre, but it is certain the practical outcome was inconsiderable. In the year 1661 a loom was set up in Danzig, for which a claim was made that it could weave four or six webs at a time without human aid, and be worked night and day; this was probably a ribbon loom. In order to prevent such a machine from injuring the poor people the authorities in Poland suppressed it, and privately strangled or drowned the inventor. M. de Gennes, a French naval officer, in 1678 invented a machine whose chief features consisted in controlling the healds by cams, the batten by cams and springs and the shuttle by a carrier. From 1678 to 1745 little of importance appears to have been done for the mechanical weaving of broadcloth, but in the last-named year M. Vaucanson constructed a very ingenious, self-acting loom, on which the forerunner of the Jacquard machine was mounted; he also adopted de Gennes' shuttle carrier.

During the last quarter of the 18th century it was generally believed that, on the expiry of Arkwright's patents, so many spinning mills would be erected as to render it impossible to consume at home the yarns thus produced, and to export them would destroy the weaving industry. Many manufacturers also maintained it to be impossible to devise machinery which would bring the production of cloth up to that of yarn. It was as a protest against the last-named assertions that Dr. Edmund Cartwright, a clergyman of the Church of England, turned his attention to mechanical weaving. More fortunate than his predecessors, he attacked the problem after much initial work had been done, especially that relating to mechanical spinning and the factory system, for without these no power-loom could succeed. In 1785 Dr. Cartwright patented his first power-loom, but it proved to be valueless. In the following year, however, he patented another loom which has served as the model for later inventors to work upon. He was conscious that for a mechanically driven loom to become a commercial success either one person would have to attend several machines or each machine must have a greater productive capacity than one manually controlled. The thought and ingenuity bestowed by Dr. Cartwright upon the realization of his ideal were remarkable. He added parts which no loom, whether worked manually or mechanically, had previously been provided with, namely, a positive let-off motion and warp and weft stop motions; and he planned to size the warp while the loom was in action. With this machine he commenced to manufacture fabrics at Doncaster, and by so doing discovered many of its shortcomings, and these he attempted to remedy: by introducing a crank and eccentrical wheels to actuate the batten differentially; by improving the picking mechanism; by a device for stopping the loom when a shuttle failed to enter a shuttle box; by preventing a shuttle from rebounding when in a box; and by stretching the cloth with temples that acted automatically. In 1792 Dr. Cartwright obtained his last patent for weaving machinery. This provided the loom with multiple shuttle boxes for weaving checks and cross-stripes. But all his efforts were unavailing, and it became apparent that no mechanism, however perfect, could succeed so long as warps continued to be sized while a loom was stationary. His plans for sizing them while a loom was in operation, and also before being placed in a loom, both failed. Still, provided continuity of action could be attained, the position of the power-loom was assured, and means for the attainment of this end were supplied in 1803 by William Radcliffe and his assistant, Thomas Johnson, by their inventions of the beam warper and the dressing sizing machine.

For upwards of 30 years the power-loom was worked under numerous difficulties. The mechanism of the loom itself, the preparatory processes and the organization of the industry were all imperfect. Textile workers were unused to automatic machinery, and many who had been accustomed to labour in their own homes refused employment in mills, owing to dislike of the factory system and the long hours of toil which it entailed. Yet improvements in every branch of the textile industry followed each other in quick succession, and the loom slowly assumed its present shape. By using iron instead of wood in its construction, and centring the batten, or slay, below instead of above the warp line, the power loom became more compact than the hand-loom.

In the modern power-loom (figs. 28 and 29), motion is communicated to all the working parts from a main shaft A, upon which two cranks are bent to cause the slay to oscillate; by toothed wheels this shaft drives a second shaft, C, at half its own speed. For plain weaving four tappets are fixed upon the second shaft—two, D, for moving the shuttle to and fro, and two others, E, for moving the healds, L, up and down through the medium of treadles M, M. For other schemes of weaving shedding tappets

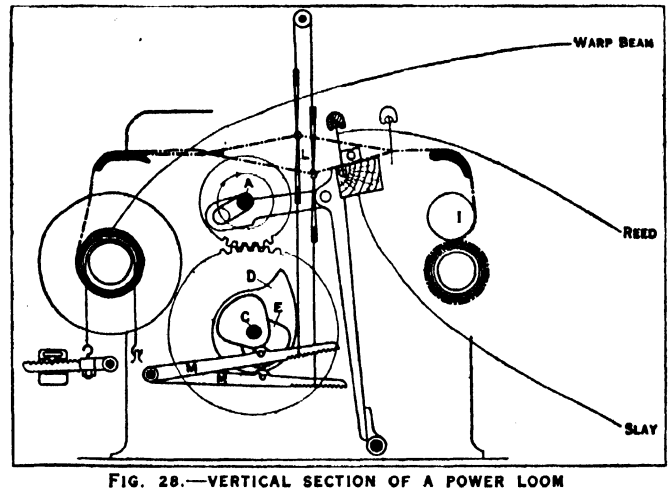

FIG. 28.—VERTICAL SECTION OF A POWER LOOM

are more numerous, and are either loosely mounted upon the second shaft or fixed upon a separate one. In either event they are driven by additional gearing, for the revolutions of the tappets to those of the crank shaft must be as one is to the number of picks in the repeat of the pattern to be woven. The warp beam is often put under the control of chains instead of ropes, as used in hand looms, and the chains are attached to adjustably weighted levers, whereby the effectiveness of the weights may be varied at pleasure. In the manufacture of heavy fabrics, however, it may be necessary to deliver the warp by positive gearing, which is either

connected, or otherwise, to the taking-up motion. The cloth is drawn forward regularly as it is manufactured by passing it over the rough surface of a roller, I, and imparting to the roller an intermittent motion each time a pick of weft is beaten home. This motion is derived from the oscillating slay, and is communicated through a train of wheels. The loom is stopped when the weft fails by a fork-and-grid stop motion, which depends for its action on the lightly balanced prongs of a fork, N. These prongs come in contact with the weft, between the selvage of the web and the shuttle box each time the shuttle is shot to the side at which the apparatus is fixed. If the prongs meet no thread they are not depressed, and being unmoved a connection is formed with a vibrating lever by which the loom is stopped. On the other hand, if the prongs are tilted, the loom continues in action. If more than one shuttle is used it may be necessary to feel for each, instead of alternate threads of weft. In such cases a fork is placed beneath the centre of the cloth and lifted above a moving shuttle; if in falling it meets with weft it is arrested and the loom continues in motion, but if the weft is absent the prongs fall far enough beneath the shuttle race for a stop to act upon a lever and bring the loom to a stand. To prevent a complete wreck of the warp it is essential to arrest the loom when a shuttle fails to reach its appointed box. For this purpose there are two devices, which are known respectively as fast and loose reed stop motions. The first was invented in 1796 by Robert Miller, and its action depends upon the shuttle, as it enters a box, raising two blades, K, which if left down would strike against stops and so disengage the driving gear. The second was invented in 1834 by W. H. Hornby and William Kenworthy; it is an appliance for liberating the lower part of a reed when a shuttle remains in the warp, thus relieving it, for the time being, of its function of beating up the weft. On the release of a reed from the motion of the slay a dagger stops the loom. Temples must keep a fabric distended to the breadth of

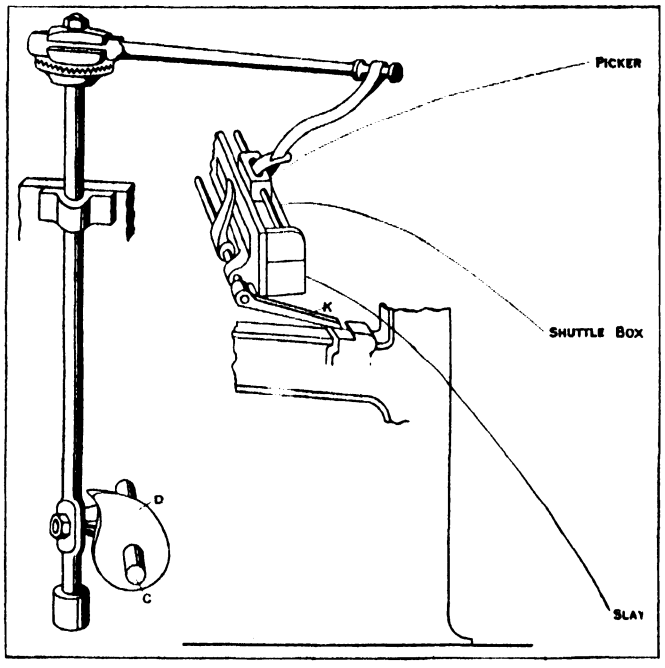

FIG. 29.—PICKING PARTS OF POWER LOOM
The illustration shows the cone overpick motion, the type generally used on the cotton looms of Lancashire and the jute looms of Dundee

the warp in the reed, and be self-adjusting. This is usually accomplished by small rollers whose surfaces are covered with fine, closely set points. The rollers are placed near the selvages of a web which is prevented from contracting widthwise by being drawn tightly over the points.

Looms are varied in details to suit different kinds of work, but as a rule fabrics figured with small patterns are provided with healds for shedding as at L, while those with large patterns are provided with the Jacquard and its harness. Healds may be operated either by tappets or dobbies, but the range of usefulness in tappets is generally reached with 12 shafts of healds and with patterns having 16 picks to a repeat; where they are unsuitable for heald shedding a dobby is used. A dobby may resemble, in construction and action, a small Jacquard; if so the selection of healds that rise and fall for any pick is made by cards. In other types of dobbies the selection is frequently made by lags, into which pegs are inserted to pattern in the same manner that cards

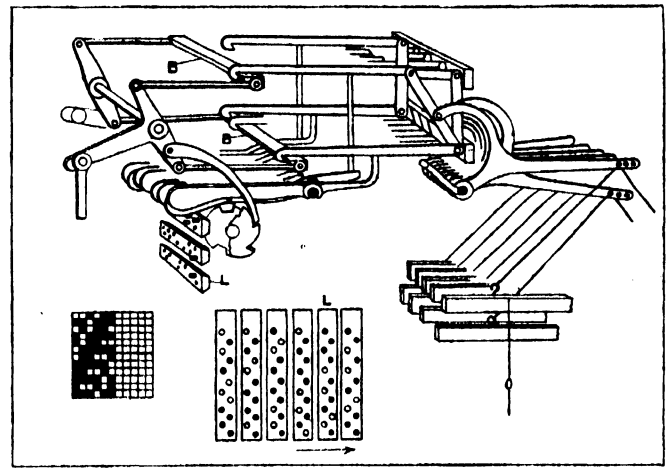

FIG. 30.—DOBBY SHEDDING MOTION, WIDELY USED FOR LIGHT CLOTHS REQUIRING SMALL PATTERNS, AS STRIPED SHIRTINGS AND DRESS FABRICS

are perforated. A dobby of this type is illustrated in fig. 30, which shows detached the pegging of the pattern lags for a small design, filled in circles representing pegs. The pattern lags, L, act on levers which lower hooks into contact with the oscillating griff bars B, and these lift the required heald shafts. The figure shows a double acting dobby, one lag, with two rows of pegs, serving for two picks. Some dobbies are made single acting and some have rollers instead of pegs to form a pattern. When multiple shuttles are required for power looms one of two types is selected, namely, drop or rotating boxes; the former are applicable to either light or heavy looms, but the latter are chiefly confined to light looms. As previously stated, Robert Kay invented drop boxes in 1760, but they were not successfully applied to the power-loom until 1845, when Squire Diggle patented a simple device for operating them automatically. Since his time many other methods have been introduced, the most successful of these being operated indirectly from the shedding motion. Revolving boxes were patented in 1843 by Luke Smith.

Many devices have been added to power looms with a view to reduce stoppages, among which those for the automatic supply of weft are probably the most important. These efforts originated with Charles Parker, who in 1840 obtained the first patent, but no marked success was achieved until 1894, when J. H. Northrop patented a cop changer. By his plan a cylindrical magazine, placed over one shuttle box, is charged with cops or pirns. When fresh weft becomes necessary the lowest cop in the hopper is pressed into a shuttle from above, the spent one is pressed out from beneath and the new weft is led into the shuttle eye, while the loom is moving at its normal speed. The mechanism is controlled by the weft fork, or by a feeler which acts when only a predetermined quantity of weft remains inside a shuttle. Many inventions are designed to eject an empty shuttle and introduce a full one; others change a cop, but differ in construction and action from the Northrop. By relieving a weaver of the labour of withdrawing, filling, threading and inserting shuttles it was seen that a large increase might be made in the number of looms allotted to one weaver, provided suitable mechanism could be devised for stopping a loom on the failure of a warp thread and for automatically maintaining a constant tension on the warp. With these devices as many as 100 looms have been supervised by one weaver.

Warp stop motions date from 1786, when Dr. Cartwright suspended an independent detector from each warp thread until a fracture occurred, at which time a detector fell into the path of a vibrator and the loom was stopped. The demand for warp stop

motions was, however, small until automatic weft supply mechanisms were introduced, and the majority of those devices now in use are constructed upon similar lines to the invention of Dr. Cartwright.

Smallware Looms.—A loom, which was for a long period operated manually, but to which mechanical power could be applied, was brought into use more than a century before Dr. Cartwright's invention. It was known as the Dutch engine loom, and was designed to weave from eight to upwards of 40 tapes or ribbons simultaneously. This machine may be regarded as a series of looms mounted in one frame, each having a complete set of parts, and as the first practical effort to connect and control all the motions of weaving from one centre. The place and date of its invention are uncertain, but it is known that in some districts its use was entirely prohibited, that in others it was strictly limited, and that it was worked in Holland about 1620. In England the first patent was obtained by John Kay and John Snell, in 1745, for additions which enabled it to be worked by hand, by water, or other force, and in 1760 John Snell appears to have added the draw harness for weaving flowered ribbons. In 1765 a factory in Manchester was filled with ribbon looms which were either invented by M. Vaucanson, or Kay and Snell, but one weaver could only attend to one machine. When worked by hand it was known as the bar-loom, because the weaver oscillated by hand a horizontal bar that set in motion all parts of the machine. The shuttles and reeds are actuated from the batten, the former originally by pegs, but later by a rack and pinion arrangement, which in action shoots the shuttles simultaneously across a web, to the right and left alternately, each into the place vacated by its next neighbour. One small warp beam is required for each web, but tappets, dobbies, or Jacquards are available for dividing the threads. Where differently coloured wefts are needed in one web the shuttles are mounted in tiers and all raised or lowered at once to bring the proper colour in line with the shed.

In *Swivel weaving*, shuttles, similar to those described above, are added to the battens of broad looms in order to diaper small figure effects, in different colours or materials, over the surface of broad webs. Weft from an ordinary shuttle forms the ground texture with the warp, and after the passage of this shuttle the small swivel shuttles place the figuring weft where required on the surface of the fabric.

Pile Weaving.—Looms for weaving piled fabrics differ in certain important respects from those employed for ordinary weaving; they are also made to differ from each other to suit the type of fabric to be manufactured, as, for example, double and single, plain and figured, textures. In *Double pile looms* the special features are those that control the pile threads and those that sever the vertical lines of pile. Two ground warps are required, and unless they are kept a uniform distance apart the piled effects will be irregular. For plain goods the pile threads are wound upon two or more beams, and as they move from web to web cloth-covered rollers deliver them in fixed lengths. Meanwhile, a shuttle passes twice in succession through each ground warp, and the pile threads in moving above or beneath the wefts are bound securely. Both fabrics are furnished with taking-up rollers which draw the pieces apart and so stretch the uniting pile in front of a knife, which severs it, thus forming two pieces at once.

The chief feature which renders most *single pile looms* dissimilar from others is the mechanism by which wires are woven upon, and withdrawn automatically from, a ground texture. Wires are of two kinds, namely, without and with knives. The former, being flattened and somewhat pointed, are woven above the weft of a ground texture, but beneath the pile, so that by withdrawing them looped pile is formed. A wire terminating in a knife with a sloping blade, on being withdrawn, cuts the pile and produces a brush-like surface. The mechanism for operating the wires is placed at one end of a loom and consists of an arm which moves in and out; at each inward movement a wire is inserted, and at each outward movement one is withdrawn. In weaving tapestry carpets, and certain other fabrics, a wire and a shuttle move simultaneously, but the shuttle passes through the ground warp, while the wire passes beneath the pile. After several wires have been woven upon the ground texture the one first inserted is withdrawn by the vibrating arm, and at the next inward movement the same wire enters the warp near the reed, where it is beaten up with the weft, and from this point the operation is continuous. Tapestry carpets require three warps, one for the ground texture, a second, or stuffing warp, to give bulk and elasticity to the tread, and a third to form the pile. The last named is printed upon a large drum, thread by thread to the colour-scheme of the design, then, when the colours have been fixed and the threads accurately placed, they are wound upon a beam, and all the warps are operated by healds. For figured velvets, and Brussels and Wilton carpets, the pile warp beam is replaced by a creel, in order that each thread of pile may be wound upon a bobbin and separately tensioned. This is essential, because, in the weaving of a design, it is probable that no two threads of pile will be required in equal lengths. Creels are made in sections called frames, each of which usually carries as many bobbins as there are loops of pile across a web, and the number of sections is the same as the number of colours. In weaving these fabrics healds are used to govern the ground warp, but a Jacquard is needed for the pile. It must form two sheds, the lower one to receive a shuttle, the upper one to make a selection of threads beneath which the wire is to pass.

Terry looms for weaving piled textures, of the Turkish towel type, have the reed placed under the control of parts that prevent it from advancing its full distance for two picks out of every series that separate one line of loops from another. At such times the weft is not beaten home but a broad crack is formed. So soon as the reed again moves through its normal space three picks of weft are simultaneously driven home, thus closing the gap and causing part of the pile to loop upward, the remainder downward. The system is available for plain and figured effects.

Gauze textures are woven in looms having a modified shedding harness, which, at predetermined intervals, draws certain warp threads crosswise beneath others and lifts them while crossed. There is also a tensioning device to slacken the crossed threads and thus prevent breakages due to excessive strain. At other times the shedding is normal.

Lappet looms have a series of needles fixed upright in laths, and placed in a groove cut in the slay, in front of the reed. Each needle carries a thread which does not pass through the reed. The needles are lifted for each pick and lowered after the passage of the shuttle, which is guided, not by the reed but by a series of pins in front of the needles and lifted and lowered along with the latter. After being lowered the needles are moved sideways the width of the figure and again lifted for the next pick. The edges of the figure are bound in this way to the ground texture by the weft.

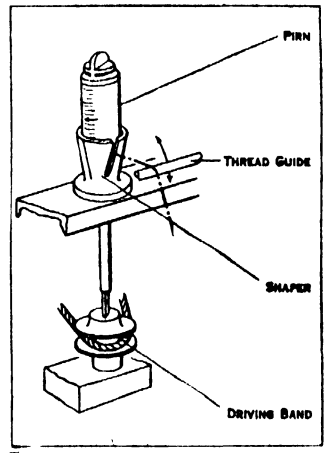

FIG. 31.—PIRN WINDING MACHINE, FOR WINDING COLOURED, AND SOMETIMES GREY, WEFT YARNS ON PIRNS FOR THE LOOM SHUTTLE

Preparing Warp and Weft for Weaving.—The power loom is only one of a series of machines which revolutionized weaving. Although early inventors of the power loom did much to perfect its various movements, the commercial results were disappointing, chiefly because means had not been devised for preparing warp and weft in a suitable manner for such a machine. William Radcliffe, of Stockport, perceived these shortcomings, and concluded that, by division of labour, weaving could be brought into line with spinning machinery, then recently invented. He therefore set himself the task of solving the problems involved, and by inventing the beam warper, the dressing sizing machine, the shuttle tongue, and the pin cop, he enabled the power loom to become a factor in the textile industry.

Weft yarns invariably receive simpler treatment than warp

yarns; in many cases none at all. Cops and ring spools pass direct to the loom unless their dimensions are unsuited to the shuttles, in which case they, together with wefts bleached or dyed in hanks or used in a saturated condition, require winding upon pirns, or into cops of suitable sizes. Weft for use with automatic weft supply mechanism is frequently re-wound on to pirns, which hold much more than the cops or ring spools. This reduces the number of changes, lengthens the life of the changing mechanism and makes less work for the magazine fillers.

Pirn winders differ greatly in construction but a common type is illustrated in fig. 31. The spindles are driven at constant speed and the pirn is built up by the accumulation of yarn inside the shaper cup. The rubbing of the yarn against the cup is a disadvantage, and many winders have shapers which reduce rubbing to a minimum. These machines generally have horizontal spindles, running at constant speed, but often the speed is varied to keep constant rate of winding on to the varying diameter of the pirn.

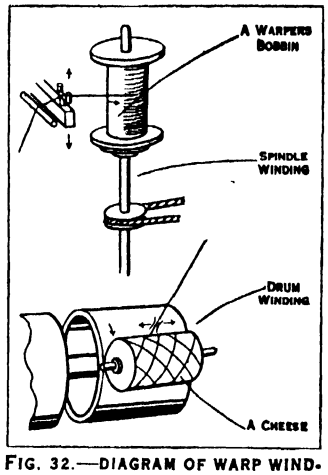

FIG. 32.—DIAGRAM OF WARP WINDING PROCESS

Warp winding consists in transferring yarn from cops, ring spools or hanks, either to warpers, bobbins or cheeses. Machines for this purpose are of two kinds, which are known respectively as spindle and drum winders (fig. 32). In the former each bobbin is placed upon a vertical spindle and rotated by frictional contact; a yarn guider meanwhile rises and falls far enough to lay the threads in even coils between the bobbin flanges. In the latter each bobbin, or tube, is laid upon a rotating drum and a thread guide moves laterally to and fro, slowly for a bobbin but quickly for a tube.

Warping.—Number of longitudinal threads in a web varies according to their closeness and its breadth. It is the function of a warper to provide a sufficient number of parallel threads for a web, all of equal length, and to retain their parallelism. Warpers are of three types, viz., mill, beam and sectional.

Mill warping (fig. 33) is the oldest type now in extensive use. A mill warper has a creel in which from 50 to upwards of 300 bobbins or cheeses are supported horizontally upon pegs, and the mill has a vertical axis which carries a reel from 5 to upwards of 20yd.

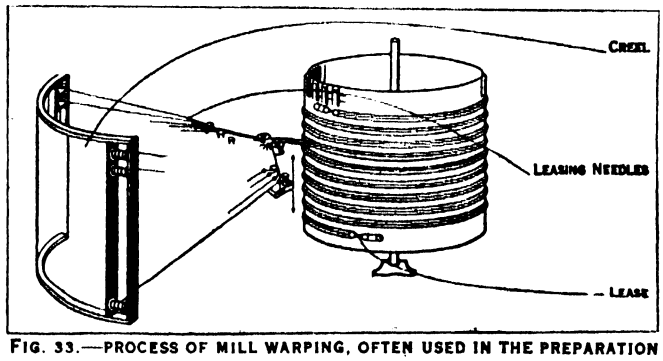

FIG. 33.—PROCESS OF MILL WARPING, OFTEN USED IN THE PREPARATION OF STRIPED COLOURED WARPS

in circumference. The threads from the creel are threaded in succession through leasing needles, then passed in groups of four to 20 threads between runners, and finally fastened by a peg to the mill staves. The needles are mounted alternately in two frames which may be lifted separately, one to elevate odd threads, the other even ones, and both separations thus formed are retained upon separate pegs; this is the lease which enables a weaver to fix readily the position of a broken thread. As the mill rotates the threads form a tape about 1in. wide, and the leasing apparatus slides down a post to coil the threads spirally upon the reel. When the full length of warp has been made the mill is stopped, a lease known as a half-beer lease is picked by hand from the divisions formed by the runners and is also retained upon pegs. The mill next reverses its direction of rotation, and as the leasing apparatus ascends the threads are folded back upon themselves. Hence, if a reel is 20yd. in circumference, and 200 threads are in use to make a warp 600yd. long, and containing 2,000 threads, the reel will

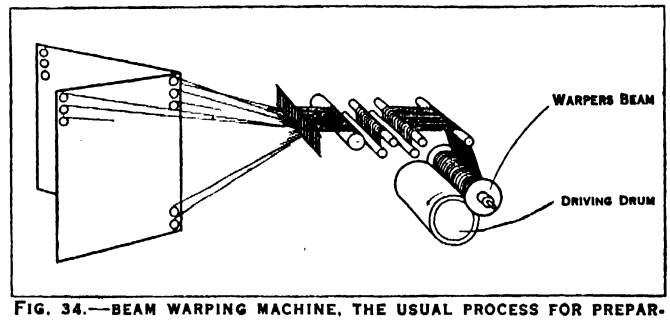

FIG. 34.—BEAM WARPING MACHINE, THE USUAL PROCESS FOR PREPARING THE WARP YARN FOR THE SLACKER SIZING MACHINE

make 30 revolutions (600÷20=30) and ten reversals, for at each reversal 200 additional threads will be added (2,000÷200=10).

Beam warping is the system most extensively used in the cotton trade. The creels for these machines have an average capacity of about 600 bobbins, and are often V-shaped in plan. In each leg of the V the bobbins are arranged in tiers of 16 to 20, and row behind row. The threads are drawn separately between the dents of an adjustable reed, then under and over a series of rollers; from here they are dropped amongst the teeth of an adjustable comb and led down to a warper's beam, which rests upon the surface of a drum. As the drum rotates the threads are drawn from the bobbins and wrapped in even coils upon the beam. On most of these machines mechanism is attached for arresting motion on the breaking of a thread, and also for accurately measuring and recording the lengths of warp made. When full, a warpers beam holds threads of much greater length than are needed for any warp, but they are insufficient in number. Thus, if 500 threads are in use, and warps of the above-named particulars are required, four similar beams must be filled (2,000÷500=4) and the threads from all are subsequently united. The chief parts of a beam warper may be used as a substitute for a mill warper, provided that mechanism be employed to contract the threads to the form of a loose rope and coil them into a cylindrical ball, which will be subsequently treated as a mill warp. Or, one of these warpers may be furnished with parts which link the roped threads loosely into a chain.

Sectional warping is chiefly employed for coloured threads and its outstanding features consist in contracting the threads to form a ribbon of from 3in. to 12in. wide. This ribbon is coiled upon a block placed between flanges, and when completed is set aside until a sufficient number of similar sections have been made; after which they are slipped upon a shaft and by endlong pressure converted into a compact mass. All the threads are then collected and transferred in the form of a sheet to a loom beam, each section contributing its own width to that of the warp. Sectional warps are also made upon horizontal mills by superposing the coils of a ribbon of yarn upon a portion of the staves. When the first section is formed a second is wound against it, and the operation continued until all the sections have been made; after which the yarn is run upon a loom beam.

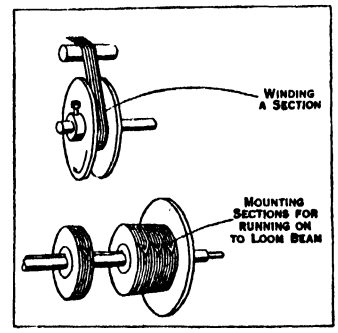

FIG. 35.—SECTION WARPING, SHOWING WARP YARN WOUND INTO SECTIONS (TOP), AND SECTIONS MOUNTED SIDE BY SIDE TO RUN YARN OFF ON LOOM BEAM (BOTTOM)

Yorkshire Dressing and Scotch Dressing.—These systems are used to make striped warps from balled warps which have been dyed in different colours. The operation of Yorkshire dress-

ing is as follows: The requisite number of threads of any colour is split from a uniformly dyed ball and set aside until warps of the remaining colours have been similarly treated. The split sections from the several balls collectively contain as many threads as are needed for a warp, but those threads have still to be placed in their proper sequence. This is done by drawing them in groups of two or four between the dents of a reed to a predetermined colour-scheme, then all are attached to a loom beam which is supported in a frame. The beam is rotated and winds the threads upon itself, but in order to hold the threads taut they are passed between weighted rollers and deflected by bars arranged ladder-wise, whilst in passing from one part of the machine to another they are gradually opened out to the width of the beam. Scotch dressing is an alternative system of making striped warps from dyed balled warps. Here, instead of being taken direct to the dressing frame, the required number of threads of each colour are first wound on to a beam. The threads from these differently coloured beams are then combined at the dressing frame and wound on to the loom beam according to the colour pattern, the yarn being wound on under considerable tension and the beam consolidated by a presser roller. This method gives a firmer beam than Yorkshire dressing, and the system is well suited to the preparation of several similar loom beams which can all be run from one set of coloured beams.

Sizing.—In cases where single yarns are made from short fibrous materials, smooth surfaces are obtained by laying outstanding ends of fibres upon the thread and fastening the fibres together to impart sufficient strength to resist the strains of weaving. This is accomplished either by coating the threads or by saturating them with an adhesive paste. In hand-loom days the paste was applied by brushes to successive stretches of warp while in a loom. But with the advent of mechanical weaving it was found necessary to size a warp before placing it in a loom. Two systems were evolved. One, invented by William Radcliffe, sizes, dries and beams a warp in one operation, the yarn being made to pass in the form of a sheet between a pair of rollers, the lower one being partly immersed in warm size. This roller carries upon its surface a film of size which it deposits upon the threads, while, by pressure, the upper roller distributes the size evenly. Brushes, acting automatically, smooth down the loose fibres and complete the distribution of size. As the yarn advances it is separated by reeds and lease rods, so that in passing over steam-chests and fans the moisture contained in the threads may be quickly evaporated. This machine is a duplex one, for the warpers beams are divided into two sets and placed at opposite ends of the machine, both sets receiving similar treatment as they move to the centre, where the loom beam is placed.

While efforts were being made to perfect Radcliffe's dressing machine a system of sizing ball warps was being gradually evolved and this system is still largely employed. The machine consists of a long trough, inside which a series of rollers are fitted, either in one horizontal plane or alternately in two horizontal planes, whilst over the front of the trough a pair of squeezing rollers are mounted. The trough contains size, which is maintained at a boiling temperature and in sufficient quantity to submerge the rollers. Two warps, in the form of loose tapes, may be simultaneously led over, under and between the rollers. As the warps advance, the threads become saturated with size, and the squeezing rollers press out all but a predetermined percentage, the latter being regulated by varying the pressure of the upper roller upon the lower one. If more size be required than can be put into the threads during one passage through the machine, they may be similarly treated a second time. This process does not lay all the loose fibres, but the threads remain elastic. After sizing, the warps are passed round a set of steam-heated cylinders by which the moisture contained in the threads is evaporated; they are next either reballed or wound upon a loom beam.

For sizing cotton yarns Radcliffe's dressing machine has to a large extent been displaced by the slasher, but in some branches of the textile industry it is still retained under various modifications. In a slasher the threads from a number of warping beams are first combined into one sheet, then plunged into a trough filled with size which is kept at a boiling temperature by perforated steam pipes. The threads are next squeezed between two pairs of rollers mounted in the trough. The under surfaces of the sizing rollers are in the size, and the upper squeezing rollers, which are covered with flannel, rest by gravitation upon the lower ones. On leaving the size trough the sheet of yarn almost encircles two steam-heated cylinders which quickly expel moisture

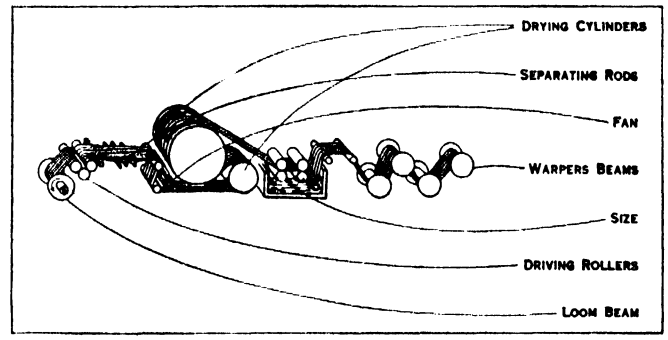

FIG. 36.—SLASHER SIZING MACHINE, FOR APPLYING SIZE TO THE WARP YARN AND FOR WINDING IT ON THE LOOM BEAM, ESPECIALLY IF CLOTH IS TO BE GREY OR ALL OF ONE COLOUR

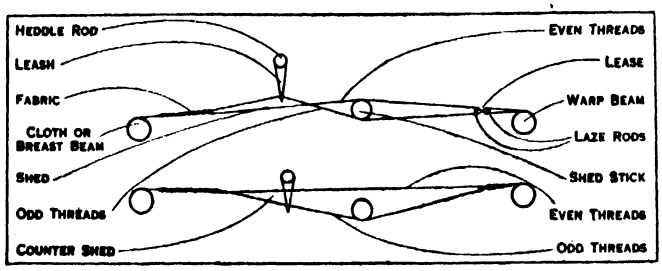
from the yarn, but so much heat is retained that fans have to be employed to throw cool air amongst the threads. The yarn is next measured, passed above and below rods which separate threads that have been fastened together by size, smeared with piece marks, and coiled upon a loom beam.

Hank sizing is chiefly, but not exclusively, employed for bleached and coloured yarns. Machines for doing this work consist of a tank which contains size, flanged revolving rollers and two hooks. One hook is made to rotate a definite number of times in one direction, then an equal number the reverse way; the other has a weight suspended from its outer end and can be made to slide in and out. Size in the tank is kept at the required temperature by steam pipes, and "doles" of hanks are suspended from the rollers with about one-third their length immersed in size. As the hanks rotate all parts of the yarn enter the size, and when sufficiently treated they are removed from the rollers to the hooks where they are twisted to cause the size to penetrate the yarn and to wring out excess size. If sufficient size has not been added by one treatment, the wrung-out hanks are passed to a similar machine containing paste of greater density than the first and are treated a second time; if necessary this may be followed by a third passage. On the completion of sizing the hanks are removed either to a drying stove or a drying machine.



Drawing-in, or *entering*, is the operation of passing warp threads through the eyes of a shedding harness, in a sequence determined by the nature of the pattern to be produced, and the order of lifting the several parts. It is effected by passing a hook through each harness eye in succession, and each time a thread is placed in the hook by an attendant it is drawn into an eye by the withdrawal of the hook. The operation is generally done by hand, but for the simpler cloths, and particularly for repetition work, mechanical drawing-in is often used.

Twisting consists in twisting, between the finger and thumb, the ends of a new warp separately upon those of an old one, the remains of which are still in the eyes of the shedding harness. The twisted portions adhere sufficiently to permit of all being drawn through the eyes simultaneously.

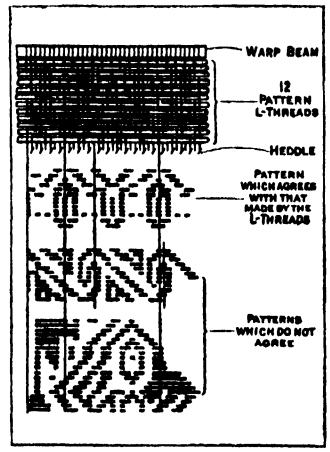
PRIMITIVE



True weaving consists "of the interlacing at right angles by one series of filaments or threads, known as the *weft* or *woof*, of another series known as the *warp*, both being in the same plane." The *warp* threads are stretched from a *cloth-* or *breast-beam* to another beam known as the *warp-beam*. The process of weaving is then carried out by raising the odd threads, leaving the even ones

FROM ROTH, "STUDIES IN PRIMITIVE LOOMS" (ROYAL ANTHROPOLOGICAL SOCIETY)

FIG. 37

in position and passing the *woof* through the opening thus made. The odd threads are then lowered, the even ones raised, and the woof again passed between them. This is continued until the warp is full. The space between the odd and even threads when the former are raised is known as a *shed*, when the latter are raised as a *counter-shed*. The passing of the woof through either is termed *making a pick*. After each *pick* is made the woof is pressed home into position by a *beater-in* or *sword* usually a flat slat of wood. In some primitive looms the odd and even threads are laboriously raised by hand, but more commonly a *heddle* and *shed stick* are used. The simplest heddle consists of a bar of wood to which the odd warp threads are attached—this, the *rod heddle*, is always worked by hand. The *frame heddle* is composed of two parallel rods connected by a number of thin bars or strands, each with an eye or loop in the centre through which the odd warp threads pass (fig. 37). In Africa and Indo-China this is worked with the feet by means of treadles. The *shed stick* is a rod, usually of some thickness, which passes over the odd and under the even threads. When the heddle is not raised the thickness and weight of the shed-stick depresses the odd threads and so makes the *counter-shed* (fig. 38). A more efficient form of shed-stick is a lath which is set on edge to form the counter-shed. To prevent the warp threads from becoming entangled, either two slender laths are passed close to the warp-beam, one over the even and under the odd, the other over the odd and under the even threads; this prevents the warp threads from moving laterally or a *warp-spacer* is employed, *i.e.*, two parallel rods united by a number of rigid bars between which the warp-threads are passed in varying quantities. In many Indonesian and some African looms this is placed on the cloth-beam side of the heddles and serves as a *beater-in* as well. It is similar to the *reed* of a European hand-loom. An appliance which is sometimes used is the *temple*, usually a slender rod with a point at either end, inserted in the fabric horizontally close to the portion under construction, serving to keep the width of the web even. Except where the weft threads are discontinuous, as in the raffia looms of West Africa, the weft is wound upon a *spool*. The arrangement is either as on a European bobbin or the threads may pass lengthwise as on a netting needle. Where the former method is employed, the bobbin is usually encased in a shuttle, but among primitive peoples the latter is the more common. In Indonesia and Indo-China the material used in weaving is generally cotton, and this is also

FROM ROTH, "STUDIES IN PRIMITIVE LOOMS" (ROYAL ANTHROPOLOGICAL SOCIETY)

FIG. 38

widely used in Africa; but here and in the west Pacific vegetable fibre and the filaments of shredded leaves are utilized.

Variants.—Outside Africa the *horizontal loom* is most common. In this the warp beam is fixed a short distance off the ground. The cloth-beam is then either similarly fixed (as in the African specimens) or to it is fastened a girdle which passes behind the back of the weaver as she sits at work. By adjusting the position of her body she is able to regulate the tension on the warp threads. The looms of ancient Mexico and modern West Africa differ from other horizontal looms in that they lack a warp beam; instead the warp-threads are bunched together and anchored to a pole or to the ground.

The *vertical loom* is now found among primitive peoples in Africa, India and parts of North America. It was used in ancient Egypt and a special variety, with weights instead of a warp beam, in classical Greece. The African vertical loom has two varieties, that for weaving cotton and that for working raffia. They are probably related historically, possibly to the ancient Egyptian form. In them the warp-beam is the upper, the cloth-beam the lower; that is, the weaver begins his work at the bottom. A sloping loom is used by the Bushongo, wherein the warp is stretched at an angle of about 60° and the weaver sits underneath it, working from the bottom upwards.

Distribution.—The art of weaving occurs sporadically among primitive peoples. The vertical loom is found in Africa, India and among the Zuni, Navaho and kindred tribes of North America. The horizontal loom with fixed cloth-beam is mainly African; that with a back-strap is found in Farther India, Indo-China, in parts of Indonesia, Micronesia and north, central and south America, among the Ainu of Japan and in a few islands of Melanesia. In this last area its presence is almost undoubtedly due to Micronesian influence. In some islands, such as the Banks group and Santo (New Hebrides), it appears to have become a lost art, since there is evidence of its having been practised there formerly.

Sociological and Religious Aspect of Weaving.—Weaving is often the prerogative of one or other of the sexes. In Africa all the weavers are men, and though women may spin they are often prohibited from touching a loom. With the exception of Oceania the horizontal loom with the back-strap is worked mainly by women. Weaving may be restricted to villages or families, and among the Tangkhul Nagas of Assam, if a woman of a weaving village marries and goes to live elsewhere, she usually ceases to ply her craft. Even certain designs may be owned. In olden days in Ashanti the king appeared to hold "copyright" of all new designs, which were treated as a "tartan." Among the Sema Nagas a woman may not weave while her husband is away hunting, trading or fighting. The Ashanti hold it wrong to break or burn any part of a loom, and they therefore throw those which are past service into a stream. If a man weaver commits adultery with the wife of a weaver a sheep must be sacrificed in atonement to the loom as well as to the ancestral stools.

Soc.*, vols. xlvi.–xlviii. 1916–18), and "Ancient Egyptian and Greek Looms," *Bankfield Museum Notes*, series 2, No. 2; J. H. Hutton, *The Sema Nagas* (1922); R. S. Rattray, *Religion and Art in Ashanti* (1927), contains a very detailed account of the technical processes and the manifold designs; richly illustrated. (C. H. W.)

WEBB, SIR ASTON (1849–), British architect, son of Edward Webb, engraver and painter, was born in London on May 22, 1849 and elected president of the Architectural Association in 1884, and of the Royal Institute of British Architects in 1902. He restored the beautiful church, St. Bartholomew's, Smithfield, London. He was knighted in 1904 and made K.C.V.O. in 1914. He designed the new front of Buckingham Palace, and the architectural settings for the Queen Victoria Memorial there, as also

the Admiralty Arch at the other end of the Mall, London. He completed the Victoria and Albert Museum, the Royal College of Science and other institutions at South Kensington as well as many private houses, among them Yeaton-Peverey, Shrewsbury. New buildings for the Army and Navy Co-operative Society are among his latest work in London. In Jan. 1919 he was elected president of the Royal Academy, being the second architect to fill that post. He resigned in 1925, and was made G.C.V.O.

WEBB, MATTHEW (1848–1883), English swimmer, generally known as "Captain Webb," was born at Dawley, Shropshire on June 18, 1848, the son of a doctor. While still a boy he saved one of his brothers from drowning in the Severn, and, while serving on board the training ship in the Mersey, he again distinguished himself by saving a drowning comrade. He served his apprenticeship in the East India and China trade, shipped as second mate for several owners, and in 1874 was awarded the first Stanhope gold medal by the Royal Humane Society for an attempt to save a seaman who had fallen overboard from the Cunard steamship "Russia." In 1875 Captain Webb became a professional swimmer. On July 3 he swam from Blackwall Pier to Gravesend, a distance of 20 m. in 4¾ hours, a record which remained unbeaten until 1899. In the same year, after one unsuccessful attempt, he swam the English Channel, on Aug. 24, from Dover to Calais in 21¾ hours. He lost his life on July 24, 1883, in an attempt to swim the rapids and whirlpool at Niagara.

WEBB, PHILIP SPEAKMAN (1831–1915), British architect, was born at Oxford on Jan. 12, 1831. He was educated at Aynho, Northants, and after being articled to a Reading firm, entered the office of G. E. Street, Oxford, where he met William Morris. In 1856 he set up for himself in London, and after the establishment of the firm founded by Morris (Morris, Marshall, Faulkner and Co.), produced for them many designs for the most varied purposes, house decoration, tiles, jewellery, furniture, etc.

Webb designed many fine houses, and one church, at Brampton, Cumberland (1875). His first house was built for William Morris (Red House, Upton, 1859). He also made additions to old houses, for example Berkeley Castle and Pusey House, Berkshire. Webb was the inventor of a method by which old buildings were strengthened by filling the interior of the walls with new material. This procedure was often used by the Society for the Protection of Ancient Buildings, which Webb and Morris jointly organized and founded in 1877. He died at Worth, Sussex, on April 17, 1915.

WEBB, SIDNEY (1859–), English statesman and author, was born in London on July 13, 1859. He was educated at private schools in London and Switzerland, at the Birkbeck Institute and the City of London College. He entered the civil service by open competition as a clerk in the War Office in 1878, became surveyor of taxes in 1879, and in 1881 entered the colonial office, where he remained until 1891. In 1885 he was called to the bar at Gray's Inn. Webb was one of the early members of the Fabian Society, contributing to *Fabian Essays* (1889). He entered the London County Council in 1892 as member for Deptford, and was returned at the head of the poll in the successive elections of 1895, 1898, 1901 and 1904. He resigned from the civil service in 1891 to give his whole time to the work of the Council (where he was chairman of the Technical Education Board) and to the study of economics. He served from 1903 to 1906 on the Royal Commission on Trade Union Law and on other important commissions. He married in 1892 Beatrice Potter, herself a writer on economics and sociology, the author of *The Co-operative Movement in Great Britain* (1891) and a contributor to Charles Booth's *Life and Labour of the People* (1891–1903). Mrs. Webb was a member of the Royal Commission on the Poor Law, and she and her husband were responsible for the Minority Report (*see* POOR LAW) and for starting the widespread movement in its favour.

From 1909 onward, the Webbs played an increasingly important part in moulding the opinion of British Labour and supplying it with an intellectual armoury. They were concerned in the founding of the weekly *New Statesman* in 1913, and for some time before that had been busily promoting the development of the London School of Economics and Political Science, a department of the University of London where Mr. Webb was professor of public administration. In 1915–25, he was a member of the executive of the Labour party. In 1922 he was returned as M.P. for Seaham Harbour. In 1919, Webb was a member of the royal commission on coal mines, and put before it a complete plan for the nationalisation of the industry; in the same year he served on the committee on trusts, set up under the Profiteering acts. His inclusion in the first Labour Government was a matter of course; but his presidency of the Board of Trade (1922–23) was not marked by any striking innovations. In the MacDonald cabinet of 1929 he was secretary for the colonies and dominions.

Mr. and Mrs. Webb have published three standard works, *The History of Trade Unionism* (1894, rev. ed. 1920), *Industrial Democracy* (1897, new ed. 1902) and *English Local Government*, which reached its seventh volume in 1927; also *The Manor and the Borough* (1908); *The Break-up of the Poor Law* and *The Public Organization of the Labour Market* (1909); *English Poor Law Policy* (1910); *A Constitution for the Socialist Commonwealth of Great Britain* (1920); *The Consumers' Co-operative Movement* (1921); *The Decay of Capitalist Civilization* (1921). In 1926 Mrs. Sidney Webb issued an autobiographical work, *My Apprenticeship*.

WEBB CITY, a city of Missouri, U.S.A. Pop. (1920), 7,807, 97% native white, and estimated locally at 9,000 in 1928. Adjoining it on the east is Carterville, with a population in 1920 of 2,434. The two cities are the centre of rich lead and zinc mines, which were at their peak of production about 1910, when the combined population reached 16,356. Webb City has large powder works. White lead was discovered here in 1873 on the farm of John C. Webb. Systematic mining began in 1877.

WEBER, CARL MARIA FRIEDRICH ERNEST VON (1786–1826), German composer, was born at Eutin, near Lübeck, on the 18th of December 1786, of a family long devoted to art. His father, Baron Franz Anton von Weber, a military officer in the service of the palgrave Karl Theodor, was an excellent violinist, and his mother once sang on the stage. In 1778 Franz Anton was appointed director of the opera at Lübeck. In 1779 the prince bishop of Eutin made him his kapellmeister, and five years later he went to Vienna, placed two of his sons under Michael Haydn, and in 1785 married the young Viennese singer Genovefa von Brenner. In the following year Carl Maria von Weber was born—a delicate child, afflicted with congenital disease of the hip-joint.

Carl Maria von Weber became familiarized with the stage from his earliest infancy. Franz Anton hoped to see him develop into an infant prodigy, like his cousin Mozart. The child was taught to sing and place his fingers upon the pianoforte almost as soon as he could speak, though he was unable to walk until he was four years old. Happily his powers of observation and aptitude for general learning were so precocious that he seems, in spite of all these disadvantages, to have instinctively educated himself. In 1798 Michael Haydn taught him gratuitously at Salzburg. In April the family visited Vienna, removing in the autumn to Munich. Here the child's first composition—a set of "Six Fughettas"—was published, with a pompous dedication to his half-brother Edmund; and here also he took lessons in singing and in composition. Soon afterwards he began to play successfully in public, and his father compelled him to write incessantly. Among the compositions of this period were a mass and an opera—*Die Macht der Liebe und des Weins*—now destroyed. A set of "Variations for the Pianoforte," composed a little later, was lithographed by Carl Maria himself, under the guidance of Alois Senefelder, the inventor of the process.

In 1800 the family removed to Freiburg, where the Ritter von Steinsberg gave Carl Maria the libretto of an opera called *Das Waldmädchen*, which the boy, though not yet fourteen years old, at once set to music, and produced in the following November at Freiburg.

Carl Maria returned with his father to Salzburg in 1801, resuming his studies under Michael Haydn. Here he composed his second opera, *Peter Schmoll und seine Nachbarn*, which was unsuccessfully produced at Nuremberg in 1803. In that year he again visited Vienna, where, though Joseph Haydn and Al-

brechtsberger were both receiving pupils, his father preferred placing him under Abt Vogler. Through Vogler's instrumentality Carl Maria was appointed conductor of the opera at Breslau, before he had completed his eighteenth year. He began a new opera called *Rübezahl*, the libretto of which was "romantic" to the last degree, and Weber worked at it enthusiastically, but it was never completed, and little of it has been preserved beyond a quintet and the masterly overture, which was re-written in 1811 under the title of *Der Beherrscher der Geister*. Quitting Breslau in 1806, Weber removed in the following year to Stuttgart, where he had been offered the post of private secretary to Duke Ludwig, brother of Frederick, king of Württemberg. He worked hard, and in 1809 remodelled *Das Waldmädchen*, under the title of *Sylvana*. Weber removed to Darmstadt in order to be near his old master Abt Vogler, and his fellow-pupils Meyerbeer and Gänsbacher. On Sept. 16, 1810, he reproduced *Sylvana* at Frankfort, but with very doubtful success. His new comic opera *Abu Hassan* was completed at Darmstadt in January 1811, after many interruptions, one of which (his attraction to the story of *Der Freischütz—see* below) exercised a memorable influence upon his later career.

Weber started in February 1811 on an extended artistic tour, during which he made many influential friends, and on the 4th of June brought out *Abu Hassan* with marked success at Munich. His father died at Mannheim in 1812. In 1813 Carl Weber's wanderings were brought to an end by the unexpected offer of an appointment as kapellmeister at Prague, coupled with the duty of entirely remodelling the performances at the opera-house. He retained this post till 1816. He composed no new operas, but he had already written much of his best pianoforte music, and played it with never-failing success, while the disturbed state of Europe inspired him with some of the finest patriotic melodies in existence. First among these stand ten songs from Körner's *Leyer und Schwerdt*, including "Vater, ich rufe dich," and "Lützow's wilde Jagd"; and in no respect inferior to these are the splendid choruses in his cantata *Kampf und Sieg*, which was first performed at Prague, on Dec. 22, 1815.

Weber resigned his office at Prague on Sept. 30, 1816, and on Dec. 21, Frederick Augustus, king of Saxony, appointed him kapellmeister at the German opera at Dresden. Weber had previously meditated turning *Der Freischütz* into an opera, and, with the assistance of Friedrich Kind, he produced an admirable libretto, under the title of *Des Jägers Braut*. He had dealt with the supernatural in *Rübezahl*, and in *Sylvana* with the pomp and circumstance of chivalry; but the shadowy impersonations in *Rübezahl* are scarcely less human than the heroine who invokes them; and the music of *Sylvana* might easily have been adapted to a story of the 19th century. But Weber now knew better than to let the fiend in *Der Freischütz* sing; with three soft strokes of a drum below an unchanging dismal chord he brings him straight to us from the nether world.

Weber wrote the first note of the music of *Der Freischütz* on July 2—beginning with the duet which opens the second act. But nearly three years elapsed before the piece was completed. In the meantime the performances at the opera-house were no less successfully remodelled at Dresden than they had already been at Prague, though the work of reformation was far more difficult. Having, after much difficulty, broken off his *liaison* with Margarethe Land, Weber married the singer Carolina Brandt, a consummate artist. The new opera was completed on May 13, 1820. He had engaged to compose the music to Wolff's Gipsy drama, *Preciosa*. Two months later this also was finished, and both pieces ready for the stage.

It had been arranged that both *Preciosa* and *Der Freischütz*—no longer known by its original title, *Des Jägers Braut*—should be produced at Berlin. *Preciosa* was produced with great success at the old Berlin opera-house on June 14, 1821. On June 18, the anniversary of the battle of Waterloo, the opening of the new "Schauspielhaus" was celebrated by the production of *Der Freischütz*. The success of the piece was triumphant. The work was received with equal enthusiasm at Vienna on Oct. 3, and at Dresden on Jan. 26, 1822. Yet Weber's position as kapellmeister was not much improved by his success.

For his next opera Weber accepted a libretto based, by Frau Wilhelmine von Chezy, on the story of *Euryanthe*, as originally told in the 13th century, in Gilbert de Montreuil's *Roman de la Violette*, and repeated with alterations in the *Decamerone*, in Shakespeare's *Cymbeline*, and in several later forms. The work was produced at the Kärntnerthor theatre in Vienna, on Oct. 25, 1823, and received with enthusiasm.

Weber's third and last dramatic masterpiece was an English opera, written for Covent Garden theatre, upon a libretto adapted by Planché from Wieland's *Oberon*. It was disfigured by the spoken dialogue abandoned in *Euryanthe;* but in musical beauty it is quite equal to it, while its fairies and mermaids are as vividly real as the spectres in *Der Freischütz*. Though already far gone in consumption, Weber began to compose the music on Jan. 23, 1825. Charles Kemble had offered him £1,000 for the work, and he could not afford to rest. He finished the overture in London, at the house of Sir George Smart, soon after his arrival, in March 1826; and on April 12, the work was produced with triumphant success. Weber grew daily perceptibly weaker, and, notwithstanding the care of his kind host, Sir George Smart, and his family, he was found dead in his bed on the morning of June 5, 1826. For eighteen years his remains rested in a temporary grave in Moorfields chapel; but in 1844 they were removed and placed in the family vault at Dresden, Wagner making an eloquent speech.

Besides his three great dramatic masterpieces and the other works already mentioned, Weber wrote two masses, two symphonies, eight cantatas, and a large number of songs, orchestral and pianoforte pieces, and music of other kinds, amounting altogether to more than 250 compositions.

Weber's style rises, in his three greatest works, to heights which show his kinship with the great classics and the great moderns. His intellect was quick and clear; but yet finer was the force of character with which he overcame the disadvantages of his feeble health, desultory education and the mistakes of his youth. With such gifts of intellect and character, every moment of his short life was precious to the world; and it is impossible not to regret the placing of his training in the hands of Abt Vogler. Weber's master was an amiable charlatan, whose weakness as a teacher was thoroughly exposed, in perfect innocence, by his two illustrious pupils. Meyerbeer wished to be famous as the maker of a new epoch in opera. Weber could not help being so in reality. But all his determination could not quite repair the defects of his purely musical training, and though his weaknesses are not of glaring effect in opera, still there are moments when even the stage cannot explain them away. Thus the finale of *Der Freischütz* breaks down so obviously that no one thinks of it as anything but a perfunctory winding-up of the story, though it really might have made quite a fine subject for musical treatment. In *Euryanthe* Weber attained his full power, and his inspiration did not leave him in the lurch where this work needed large musical designs. But the libretto was full of absurdities; especially in the last act, which not even nine remodellings under Weber's direction could redeem. Yet it is easy to see why it fascinated him, for, whatever may be said against it from the standpoints of probability and literary merit, its emotional contrasts are highly musical. Indeed it is through them that the defects invite criticism.

WEBER, JOSEPH: *see* WEBER AND FIELDS.

WEBER, MAX (1864–1920), German economist, was born at Erfurt on April 21, 1864, and died in Munich on June 14, 1920. He was professor at Berlin (1893), Freiburg (1894) and at Munich (1918). Weber's first important work was *Die römische Agrargeschichte in ihrer Bedeutung für das Staats-und Privatrecht* (1891). Later he occupied himself principally with sociology and social philosophy, as in *Die sozialen Gründe des Untergangs der antiken Kultur* (1895).

Other works are *The rural Community*, lecture delivered before the international Congress in St. Louis (1904); *Russlands Uebergang zum Scheinkonstitutionalismus* (1906). The following works were published

after his death: *Gesammelte Aufsätze zur Religionssoziologie* (1920, 1921); *Gesammelte politische Schriften,* and *Gesammelte Aufsätze zur Wissenschaftslehre* (1922); *Wirtschaft und Gesellschaft* (1921); *Wirtschaftsgeschichte* (1923); *Gesammelte Aufsätze zur Soziologie und Wirtschafts Geschichte* (1924); *Gesammelte Aufsätze zur Soziologie und Sozialpolitik* (1924).

WEBER, WILHELM EDUARD (1804–1891), German physicist, was born at Wittenberg on Oct. 24, 1804, and was a younger brother of Ernst Heinrich Weber, the author of Weber's Law. He studied at Halle, and at Göttingen, was one of the seven professors who were expelled for protesting against the action of the king of Hanover (duke of Cumberland) in suspending the constitution. In 1849, he returned to Göttingen, where he died on June 23, 1891.

There was no system either of stating or measuring electrical quantities; but he showed, as his colleague K. F. Gauss did for magnetic quantities, that it is both theoretically and practically possible to define them, not merely by reference to other arbitrary quantities of the same kind, but in terms in which the units of length, time and mass are involved. Weber's theory of electricity was founded on the views of Fechner who considered that positive and negative charges move in a conductor with equal and opposite velocities. From this he worked out the law of forces between charges. Weber's work on electricity did much to stimulate mathematical physicists. He also carried on extensive researches in the theory of magnetism, and developed Faraday's ideas regarding his explanation of diamagnetic phenomena. In his observations in terrestrial magnetism he not only employed an early form of mirror galvanometer, but, about 1833, devised a system of electromagnetic telegraphy, by which a distance of some 9,000 ft. was worked over. In conjunction with his elder brother he published in 1825 a well-known treatise on waves, *Die Wellenlehre auf Experimente gegründet;* and in 1833 he collaborated with his younger brother, the physiologist Eduard Friedrich Weber (1806–1871), in an investigation into the mechanism of walking.

WEBER AND FIELDS, American comedians, were born in New York city in 1867 and 1868, respectively, and educated in the New York public schools. They made their initial stage appearances together in juvenile Dutch sketches in the old Bowery Music Hall Jan. 1, 1878, and continued together in "knockabout" sketches in small variety theatres until 1885, when they formed their own company. In 1895 they became joint managers of the Broadway Music Hall, which was thereafter generally known as "the Weber and Fields," enacting there a series of burlesques which added continually to their fame. In 1904 Fields withdrew and formed a partnership with Hamlin and Mitchell, but continued to appear at Weber's theatre. In 1912 they re-united in "Hokey-Pokey" at the Broadway theatre, and their names have been continuously associated in ever popular sketches in various New York theatres.

WEBERN, ANTON VON (1883–), Austrian composer, was born in Vienna on Dec. 3, 1883. He studied at Vienna university, taking the degree of Ph.D. in musicology, and was one of the first disciples of Schönberg, whose principles he has adopted in his own works. In concentration and intensity he even exceeds Schönberg, and the fragmentariness and almost complete absence of tangible melody or effective rhythm in his later compositions deprives them of any but an intellectual appeal. A characteristic feature is his use of pianissimo.

His works include: A two string quartet op. 5 and 9; Pieces for violin and piano op. 7; Passacaglia and five Pieces, op. 5, for orchestra; *Geistliche Lieder* for soprano with 5 instr., op. 16; and a string trio (1928). *See* Paul Stefan, *Neue Musik und Wien.*

WEBER'S LAW, in psychology, the name given to a principle first enunciated by the German scientist, Ernst Heinrich Weber (1795–1878), who became professor at Leipzig (of anatomy, 1818, of physiology, 1840). He was specially famous for his researches into aural and cutaneous sensations. His law, the purport of which is that the increase of stimulus necessary to produce an increase of sensation in any sense is not an absolute quantity but depends on the proportion which the increase bears to the immediately preceding stimulus, is the principal generalization of that branch of scientific investigation which has come to be known as psycho-physics (*q.v.*).

According to Gustav Fechner (*q.v.*), who has done most to prosecute these inquiries and to consolidate them under a separate name, "psycho-physics is an exact doctrine of the relation of function or dependence between body and soul." In other words, it is throughout an attempt to submit to definite measurement the relation of physical stimuli to the resulting psychical or mental facts, and forms an important department of experimental psychology. It deals with the quantitative aspects of mental facts—their intensity or quantity proper and their duration. Physical science enables us, at least in the case of some of the senses, to measure with accuracy the objective amount of the stimulus, and introspection enables us to state the nature of the subjective result. Thus we are able to say whether a stimulus produces *any* psychical result, and can fix in that way the *minimum sensibile* or "threshold of consciousness" for each of the senses. In like manner (though with less accuracy, owing to the disturbing nature of the conditions) we can fix the sensational maximum, or upper limit of sensibility, in the different senses, that is to say, the point beyond which no increase of stimulus produces any appreciable increase of sensation. We thus determine, as Wundt puts it, the limit-values between which changes of intensity in the stimulus are accompanied by changes in sensation. But the central inquiry of psycho-physics remains behind. Between the quantitative minimum and the quantitative maximum thus fixed can we discover any definite relation between changes in the objective intensity of the stimuli and changes in the intensity of the sensations as estimated by consciousness.

As we have no means of subjectively measuring the absolute intensity of our sensations, it is necessary to depend upon the mental estimate or comparison of two or more sensations. Comparison enables us to say whether they are equal in intensity, or if unequal which is the greater and which is the less. But as they approach equality in this respect it becomes more and more difficult to detect the difference. By a series of experiments, therefore, it will be possible, in the case of any particular individual, to determine the just observable difference in intensity between two sensations of any particular sense. This least observable difference is called by Fechner the *Unterschiedsschwelle* or "difference-threshold," that is to say, the limit of the discriminative sensibility of the sense in question. That such a "threshold," or least observable difference, exists is plain from very simple examples. Very small increases may be made in the objective amount of light, sound or pressure—that is, in the physical stimuli applied to these senses—without the subject on whom the experiment is made detecting any change. It is further evident that, by means of this just observable difference, it is possible to compare the discriminative sensibility of different individuals, or of different senses, or (as in the case of the skin) of different parts of the same sense organ: the smaller the difference observable the finer the discriminative sensibility. Thus the discrimination of the muscular sense is much more delicate than that of the sense of touch or pressure, and the discriminative sensibility of the skin and the retina varies very much according to the parts of the surface affected. Various methods have been adopted with a view to determine these *minima* of discriminative sensibility with an approach to scientific precision. The first is that employed by Weber himself, and has been named the method of just observable differences. It consists either in gradually adding to a given stimulus small amounts which at first cause no perceptible difference in sensation but at a certain point do cause a difference to emerge in consciousness, or, vice versa, in gradually decreasing the amount of additional stimulus, till the difference originally perceived becomes imperceptible. By taking the average of a number of such results, the minimum may be determined with tolerable accuracy. The second method is called by Fechner the method of right and wrong cases. When two stimuli, A and B, are very nearly equal the subject will often fail to recognize which is the greater, saying sometimes that A is greater, sometimes that B is greater. When in a large number of trials the right and wrong guesses exactly balance one another we may conclude that the difference between the two stimuli is not appreciable by the

sense. On the other hand, as soon as the number of correct guesses definitely exceeds half of the total number of cases, it may be inferred that there is a certain subjective appreciation of difference. This method was first employed by Vierordt. The third method, that of average errors, is very similar to the one *just explained*. Here a certain weight (to take a concrete example) is laid upon the hand of the person experimented upon, and he is asked, by the aid of subjective impression alone, to fix upon a second weight exactly equal to the first. It is found that the second weight sometimes slightly exceeds the first, sometimes slightly falls below it. Whether above or below is of no consequence to the method, which depends solely on the amount of the error. After a number of experiments, the different errors are added together, and the result being divided by the number of experiments gives us the average error which the subject may be calculated upon to make. This marks the amount of stimulus which is just below the difference-threshold for him. This method was first employed by Fechner and Volkmann. Another method, known as the "method of mean gradation," was first introduced by Plateau. It consists in getting the subject to find or select a stimulus that shall be, or at least appears to him to be, midway between two given stimuli. The different methods were first named, and the theory of their application developed by Fechner in his *Elemente der Psychophysik* (1860).

A number of experimental variations have since been devised by Wundt and others, but they are all reducible to the two types of the "gradation" and "error" methods. These methods have been chiefly applied to determine the relation of the difference-threshold to the absolute magnitude of the stimuli employed. For a very little observation tells us that the smallest perceivable difference is not an amount whose absolute intensity is constant even within the same sense. It varies with the intensity of the stimuli employed. We are unable, for example, to recognize slight differences in weight when the weights compared are heavy, though we should be perfectly able to make the distinction if the weights compared were both light. Ordinary observation would lead us, therefore, to the conclusion that the greater the intensity of the original stimulus at work the greater must be the increase of stimulus in order that there may be a perceptible difference in the resulting sensation. Weber was the first (after a prolonged series of experiments) to clothe this generality with scientific precision by formulating the law which has since gone by his name. He showed that the smallest perceptible difference is not absolutely the same, but remains relatively the same, that is, it remains the same fraction of the preceding stimulus. For example, if we can distinguish 16 oz. and 17 oz., we shall be able to distinguish 32 oz. and 34 oz., but not 32 oz. and 33 oz., the addition being in each case $\frac{1}{16}$ of the preceding stimulus. This fraction (supposing it to be the difference-threshold of the muscular sense) remains a constant, however light or however heavy the weights compared. The law may be formulated thus:—The difference between any two stimuli is experienced as of equal magnitude, in case the mathematical relation of these stimuli remains unaltered. Or, otherwise expressed, in order that the intensity of a sensation may increase in arithmetical progression the stimulus must increase in geometrical progression.

It is also expressed by Fechner in the form: The sensation increases as the logarithm of the stimulus.

VARIOUS INTERPRETATIONS

The law has been variously interpreted. Fechner himself designated it the psycho-physical law, and treated it as the fundamental formula of the relation between body and mind, thus assigning to it an ontological dignity and significance. But in this "psychophysical" interpretation of his results he has not had a numerous following. Wundt interprets the law in a purely "psychological" sense, making it a special instance of the general law of relativity which governs our mental states. Introspection can give us no information as to the absolute intensity of the stimulus; for a stimulus is known in consciousness only through its sensational resultant. Hence, he argues, we can only compare one psychical state with another, and our standard of measurement is therefore necessarily a relative one; it depends directly upon the preceding state with which we compare the present. Others (*e.g.*, G. E. Müller) have attempted to give the law a purely physical or "physiological" explanation. Instead of holding with Fechner that the law expresses a recondite relation between the material and the spiritual world, they prefer to regard the quantitative relation between the last physical antecedent in the brain and the resultant mental change as prima facie one of simple proportion, and to treat Weber's law as holding between the initial physical stimulus and the final action of the nerve-centres. According to this interpretation, the law would be altogether due to the nature of nervous action. As a nerve, says Sully, after a temporary degree of stimulation temporarily loses its sensibility, so the greater the previous stimulation of a nerve the greater is the additional stimulus required to produce an appreciable amount of sensation.

Weber's law, it must be added, holds only within certain limits. In the "chemical" senses of taste and smell experiments are almost impossible. It is not practicable to limit the amount of the stimulus with the necessary exactitude, and the results are further vitiated by the long continuance of the physiological effects. The same considerations apply with still more force to the organic sensations, and the results in the case of temperature sensations are completely uncertain. The law is approximately true in the case of sight, hearing, pressure, and the muscular sense—most exactly in the case of sound. As this is the sense which affords the greatest facilities for measuring the precise amount of the stimulus, it may perhaps be inferred that, if we could attain the same exactitude in the other senses, with the elimination of the numerous disturbing extraneous influences at work, the law would vindicate itself with the same exactitude and certainty. It is further to be noted, however, that even in those senses in which it has been approximately verified, the law holds with stringency only within certain limits. The results are most exact in the middle regions of the sensory scale; when we approach the upper or lower limit of sensibility they become quite uncertain.

BIBLIOGRAPHY.—Weber's investigations were published as "Der Tastsinn und das Gemeingefühl," in Wagner's *Handwörterbuch der Physiologie*, iii. (1846). Fechner's *Elemente der Psychophysik* (1860) contains an elaborate exposition of the whole subject. He replied to his critics in two later works, *In Sachen der Psychophysik* (1877) and *Revision der Hauptpunkte der Psychophysik* (1882). Delboeuf's *Étude psychophysique* (1873), *Examen critique de la loi psychophysique* (1883), and *Éléments de psychophysique générale et spéciale* (1883), and G. E. Müller's *Zur Grundlegung der Psychophysik* (1878) are also important documents; and the subject is fully treated in Wundt's *Grundzüge der physiologischen Psychologie* (ed. 1902–1903), and "Über die Methode d. Minimaländerungen," in *Philos. Stud.* (Leipzig, 1883), or, more popularly, in his *Human and Animal Psychology* (2nd ed., 1892), Lectures 2, 3, 4. *See* also Ladd's *Physiological Psychology* (1887), which is based upon Wundt; Meinong, in *Zeitschr. für Psychologie*, xi. (1896); Ziehen, *Leitfaden der physiologischen Psychologie* (7th ed., Jena, 1906); E. B. Titchener, *Experimental Psychology* (ii., 1905); Professor James Ward's "Attempt to Interpret Fechner's Law," in *Mind*, i. 452 *sqq.*; and generally textbooks of psychology, *e.g.* G. F. Stout's *Manual of Psychology*, bk. ii. ch. 7 (following Meinong); James's *Principles of Psychology*, ch. 13; Külpe's *Outlines of Psychology*, part i. chap. 1 and 3. *See* PSYCHOLOGY, HISTORY OF. (A. S. P.-P.)

WEBSTER, DANIEL (1782–1852), American statesman and lawyer, was born in Salisbury (N.H.), Jan. 18, 1782. His parents were rugged New England farming people. Daniel was the delicate one of the family, and not particularly inclined to farm work. From childhood, however, he loved out-of-door life, was exceedingly fond of hunting and fishing, and unusually skilful at them, and this taste, which became strong in his youth, clung to him through all his long career.

His early schooling was primitive. But he had a passion for books of all sorts. Bits of the poets and illustrations from the great historians were always ready to his hand when he needed them and came out with singular appropriateness in later years. It has been urged that he was indolent. So was Sir Walter Scott. But Scott could do more work in a day than other men in a week; and so could Webster. His mind seized the essence of things.

These intellectual gifts were so manifest that Webster's father made great sacrifices to send the boy to Phillips academy, Exeter, and then to Dartmouth college. His college record was good, but not remarkable; like many men of genius, he preferred other things to the appointed task. It is said that in early days he was reluctant to speak in public, but toward the end of his college career he was known as something of an orator and debater, and when he was 18, a year before his graduation in 1801, he was invited to deliver the Fourth of July address for the town of Hanover. Some of these early speeches have been preserved, and while crude, they suggest what was to come.

With a mind like Webster's the law seemed the inevitable vocation, and the little teaching he did was merely a means to an end. As was the custom in those days, he went into the office of a practising lawyer in Boston, and the invaluable training of Christopher Gore no doubt went far in making his pupil the great lawyer that he afterwards became. He was admitted to the bar in 1805, and in 1807 settled himself to practise in Portsmouth. His reputation in law is quite as great as, perhaps more unclouded than, in statesmanship. His clear, massive, gorgeous, overwhelming eloquence carried juries with him as well as parliaments, and no estimate of his eloquence is complete that does not allow for the superb personality that gave it weight and vigour. He was a notable presence, even to those who passed him unknown in the street. The dignity of his solid figure, the rich and varied music of his voice, above all the penetrating splendour of his eyes, gave his spoken words a glory which we cannot recover, effective as his speeches often are in print. Of his jury triumphs the best known is that in the White murder case. His most celebrated plea before the Supreme Court in Washington is that for Dartmouth college, in 1818, when the personal touches, notably, "It is, as I have said, a small college, and yet there are those who love it," so affected all present that it was said of Chief Justice Marshall that "the deep furrows of his cheek expanded with emotion and his eyes suffused with tears."

Party passions, together with the power of his tongue, naturally took Webster into politics. It is said that even in childhood he began to study the Constitution as printed on a cotton handkerchief. From 1813 to 1817 he was a member of the House of Representatives. New England at that time was bitterly opposed to the Madison Administration, to the Democratic Party, and especially to the war with England, and Webster's eloquence was used unsparingly to express these New England prejudices, though he cannot be connected with the more or less disloyal Hartford Convention. At this early period, in curious contrast to his later views and arguments, he was hostile to a protective tariff, feeling that it would complete the ruin of the New England shipping interests, already sufficiently imperilled by the cost of the war.

While he was out of politics, from 1817 to 1823, Webster devoted himself energetically and profitably to the practise of law. During these years he was making his great reputation as a historical orator. In 1820 he delivered the bi-centennial speech at Plymouth, celebrating the landing of the Pilgrims, and it is probable that in the line of general eloquence he never reached a greater height than this. The significance of America, the political, social and religious principles that America stood for, and the splendid development and prospects of the Anglo-Saxon race, were portrayed with a dignity and amplitude which good judges consider worthy to be compared with Demosthenes or Burke. Webster's impressive delivery, his intense, magnetic hold upon his audience, were never more fully manifested than upon this occasion. Ticknor, who was present, gives a vivid account of his own experience: "I was never so excited by public speaking before in my life. Three or four times I thought my temples would burst with the gush of blood. . . . When I came out I was almost afraid to come near to him. It seemed to me as if he was like the mount that might not be touched and that burned with fire. I was beside myself, and am so still." The address delivered on the anniversary of the battle of Bunker Hill, in 1825, was another of these historical tributes, equally successful and well known. On Aug. 2, 1826, Webster gave, in Faneuil hall, Boston, the eulogy on John Adams and Thomas Jefferson, who had both died on the Fourth of July previous. This speech contains the famous words, attributed to John Adams, "Sink or swim, live or die," etc., which have probably been repeated in school declamations as often as any piece of rhetoric in the English language. In 1823 Webster again appeared in the House of Representatives, and in 1827 in the Senate, in which he was to play so great a part for many years. The Missouri Compromise (*q.v.*) of 1820 had for the time apparently settled the question of slavery, but in reality the rift between the two sections of the country had been opened, and it was not ever really to be closed again until after the Civil War.

Webster's position with regard to slavery was taken at this time, and in spite of his conduct in later years, it cannot be said that his theoretical attitude was ever altered. He believed, as did so many good men and leaders, both North and South, that slavery was an evil, disastrous to the white race as much as to the black. The earlier great men of the South in the main held this view, and it was left for Calhoun and Jefferson Davis, under the controlling influence of cotton, to discover that the enslavement of the blacks was ordained by God for the benefit of everybody. But Webster believed first of all in the Constitution. The Constitution recognized slavery, and therefore it was impossible to meddle with it, except to see that its increase and spread were discouraged by every means that the Constitution would permit.

On the other sectional issue, that of the tariff, which some persons consider even more vital than slavery, inasmuch as it meant the growing triumph of the industrial North over the agricultural South, Webster was more aggressive, and distinctly advocated the high protection which the Southern leaders felt to be fatal to their prosperity. But above all Webster ranged himself on the side of those who opposed sectional division and disunion tendencies altogether. In 1830 a comparatively minor debate as to the public lands brought on the Southern attack upon New England, and Webster, in defending his native state, replied to Hayne with the glorification of the Union, which probably did more to unify the country than any single utterance of any man. Hayne and his followers often had the technical interpretation of the Constitution on their side, but Webster had common sense behind him, he was himself the incarnation of common sense, and he gave the common sense of a united country a superb, an enduring dignity of expression which has never been forgotten and never can be. In his arguments with Calhoun over nullification, in 1833, there is the same striking contrast. Calhoun was perhaps more sound as regards mere technical logic, but Webster had the weight and the enduring substance of human truth.

In this nullification quarrel with South Carolina Webster heartily supported Andrew Jackson. But there was no sympathy between the two. Webster was an aristocratic Whig of the old school, Jackson an aggressive Democrat of the America to come, and over the bank and other things they came into violent conflict. It should be added that Webster's most serious contributions to political thought are to be found in his discussion of strictly financial matters. Moreover, when Jackson went out, in 1836, Webster would have liked to come in, and this was one of the acute crises in the fever of his presidential desires. It is amusing to see how many of his biographers deny his ambition. He wanted to serve his country, they say; he wanted to be where he could be of the greatest use. It is the old story, and no one has ever yet succeeded in disentangling the personal from the patriotic motive in these matters. The Presidency is the final seal of success in American politics, and no man who has given his life to those politics has ever been willing to see the Presidency slip from him without a sigh of despair. "I would rather be right than be President," said Henry Clay. But Clay and Webster and many another have persuaded themselves that the road to being President was the road to being right. Where will you find a more ingenuous avowal of ambition than in Webster's words to his friend Plumer: "I have done absolutely nothing. At 30 Alexander had conquered the world; and I am 40."

But Van Buren was elected, and Webster passed by, and for a time he turned his thoughts to private life. His affairs needed more attention than he could give them. He had been twice married, first in 1808, to Grace Fletcher, a love-match; second in 1829, to Caroline Le Roy. He had an expensive family, and his own tastes were expensive. He liked social life of all sorts, and social life was

costly. He liked eating and drinking, especially the latter. He was happy on his great farms, in Franklin and at Marshfield.

But the farms and the country life were almost as ruinous as dissipation, perhaps more so. And the trouble was aggravated by Webster's business habits, or lack of them. He was a master of theoretical finance, but he could not keep his own private accounts, did not even try to keep them systematically. In consequence, he was always in trouble, always borrowing and renewing. When such business methods get mixed up with politics, there may not be corruption, but there is terrible danger of it. Webster's biographers insist that he was never personally dishonest. But there is a profound remark of Webster himself, which is worth remembering: "There are means of influence not generally esteemed positively corrupt, which are competent to produce great effects."

With the failure of his immediate political ambitions, Webster turned his attention to more general matters, and grew anxious to see something of Europe. The embassy to England had always tempted him, and it was even said that he had manoeuvred to get his friend Everett out of the position so as to succeed him. This came to nothing, but in 1839 Webster arranged a trip across the water and he was received by his English friends with every possible attention and courtesy. He wrote rather extensive letters home, but it is curious to note, with these, as with all his correspondence, the singular lack of intimate personal revelation. In reading these lengthy epistles, we may be driven to wonder whether Webster's external life was so active and varied that it left the inner life somewhat jejune and bare.

Returning from abroad, Webster found the election of 1840 impending, but his own hopes and aspirations were completely submerged in the spectacular success of Harrison, with the log-cabin and hard cider and Tippecanoe campaign furore. Again it was evident that, widely as Webster was esteemed and respected, he had not the faculty of personal leadership. Men praised him, but they did not vote for him. Instead of the Presidency, he was forced to put up with the secretaryship of State, which was given him by Harrison, and at first continued by Harrison's successor, Vice-president Tyler. Tyler soon got into trouble with his Whig cabinet, and they all left him but Webster, who incurred some odium by remaining. His plea was that he wished to complete the negotiation with England about the north-eastern boundary. This was settled with Lord Ashburton by the treaty of 1842, an arrangement which was entirely satisfactory to neither party, and was therefore probably as fair a compromise as could have been devised. This is notable as being almost the only great constructive achievement of Webster's career. With all his intellectual and oratorical powers, the working of circumstances was such that he was almost always in opposition, and had no opportunity to show how well he could build for permanence, though the sure logical action of his genius would seem to have adapted him peculiarly for such work.

After the treaty was disposed of, Webster retired from the cabinet and for a time again disappeared into private life. The clouds seemed to be gathering about him in many ways. The deaths of his children, culminating in that of his daughter Julia, were a terrible grief to him. His money complications increased, and though his earning power was as great as ever, his gift for spending more than kept pace with it.

When he returned to the Senate in 1845, the political world was as dark as his own surroundings. He was personally attacked by Ingersoll, with charges of dishonesty during his secretaryship Congressional investigation cleared him of all but carelessness, yet men always spoke of him with a slur or an apology from the financial point of view. The menace of the Mexican War was confusing everything, and making the issue of slavery more threatening and more difficult to deal with. Webster, like Clay and Calhoun, opposed the war, but he sent his son to fight and die, as did Clay also.

The vast accession of territory that resulted from the defeat of Mexico brought all sorts of slavery complications with it. Webster took an active part in these, being in the main anxious to have slavery repressed and limited, so far as this was compatible with the Constitution. But when, in 1850, Clay brought forward his compromise measures, in the desperate attempt to avert actual civil conflict, Webster joined him, and the combined influence of the two, after months of heated debate, prevailed to have the compromise accepted. Webster's course was abused with the utmost violence by the anti-slavery section of the North, and Whittier's wail over Ichabod gave the abuse literary dignity and permanence. The senator was accused of having betrayed every high principle, in the vain hope of getting the South to support him for the Presidency. Recent historians have come more and more to reject this view. They argue that without the compromise, the Civil War would have been precipitated at that time, and that by postponing it for ten years, until the North was strengthened by the immense accession of the growing West, the whole course of American history was changed. In this view Webster became, not the destroyer but the saviour of his country, and it must at least be believed that such salvation was mainly what he aimed at.

Under Fillmore, he had to be content with the secretaryship of State, and he filled this office until the condition of his health became so critical that work of any kind was out of the question. Perhaps the most notable of his later official acts was his sharp correspondence with the Austrian *chargé* Hülsemann in regard to the affairs of Hungary. Webster died on Oct. 24, 1852.

The details of Webster's death have been recorded with curious minuteness by his biographer, Curtis. The dying statesman first delivered a senatorial oration on religious matters, perhaps, like most of his talk on such subjects, more eloquent than convincing. The exhaustion of this prostrated him for the moment. When he again came to himself, his words were: "Have I—wife, son, doctor, friends, are you all here?—have I, on this occasion, said anything unworthy of Daniel Webster?" And the audience unanimously answered, "no." It would be hard to find a more fitting final utterance for a man who had lived for 50 years in the statuesque pose.

Yet it is fair also to remember that Webster's last preoccupation on the less personal side was with his country, and he directed that the American flag should be kept flying at the masthead of his little yacht, with a light cast upon it at night, so that he could see it as long as he could see anything.

Webster's writings are best studied in the complete edition, 18 vols., 1903. This includes the two volumes of correspondence published earlier by his son. A large amount of further correspondence was published by Van Tyne in 1902. The two-volume *Life*, by Curtis (1869), is a storehouse of material, but is eminently partial to the subject. Senator Lodge's "Life," in the *American Statesman* series, is brilliantly written, but under strong Republican and anti-slavery prejudices. *The True Daniel Webster*, by Fisher (1911), adds nothing of great importance, but is sympathetic, and defends Webster where he most needs it. The *Life* by Ogg (1914), is critical and dispassionate. The *Reminiscences* of Lanman and Harvey are suggestive, but not always reliable. The writer of this article, whose grandfather was Webster's law partner, possesses a desk and a dispatch box which belonged to Webster. In the desk are a number of unpublished documents tending to support the statements made above as to Webster's financial habits.

(G. B.)

WEBSTER, JOHN (fl. 1602–1624), one of the greatest tragic writers in English literature. Of his life almost nothing is known. It is said that he was the son of a London tailor; and we learn from his own Preface to the pageant called *Monuments of Honour* that he was a member of the Merchant Taylors' Company and "born free" of it. But this does not prove that either he or his father ever actually plied the needle. It might be gathered from the ambiguous classical knowledge exhibited in his writings that he was educated at some school of repute; but his close association with so good a scholar as Heywood gave him many opportunities of picking up the scraps of Martial and Horace which adorn his pages. Reasons have been given for placing his birth about 1580; and, as we hear nothing of him after 1625, he may have died in that year. These uncertainties are intensified by the fact that several persons of that time are known to have borne his name.

At what date he "commenced playwright" is uncertain. We learn from Henslowe's diary that he collaborated with Drayton and others in *Caesar's Fate*, 1602, and with Chettle, Dekker and Heywood in *Christmas comes but once a year*. Somewhat later his name appears with that of Dekker as part-author of *Westward Hoe* and *Northward Hoe* and in 1604 he contributed the induction to Marston's *Malcontent*. In 1607 "Mr. Dickers and Mr. Webster" appear on the title-page of *The Famous History of Sir*

Thomas Wyat, a play which had no fewer than five authors and at least two titles (it is an abridgment of *Lady Jane*).

This habit of collaboration perplexes the critic who endeavours to appraise merit or mark progress in style. One collaborator may easily fall into the manner of the other, and it is not impossible that the authors themselves, after a few years, would be unable to name their own portions. Unerringly to trace the hand of Webster through Elizabethan drama is now impossible, though students still essay the task. Mr. Sykes thinks he had a share in *Anything for a Quiet Life*, usually ascribed to Middleton, and in the *Fair Maid of the Inn*, perhaps by Massinger and Ford but printed as Beaumont and Fletcher's. Mr. Sykes may be right, and has the weighty support of Mr. Lucas; but it is certain that others have been wrong. Thus in 1661 *A Cure for a Cuckold* and *A Thracian Wonder* were ascribed by the publisher Kirkman, probably without the slightest traditional justification, to Webster and Rowley. The former, as a whole, seems to bear rather the mark of Heywood than of either of the assigned authors; but there is in it an episode easily detachable from the rest and of some merit, which Gosse and Spring Rice, in 1885, printed separately under the title of *Love's Graduate*, with the wish rather than the assurance that it might be "a piece of silver-work by the sculptor whose other groups are all of bronze." As *The Guise* and *The Late Murther of the Sonne upon the Mother* (this latter partially by Ford) are alike lost, conjecture may here disport itself without danger either of proof or of confutation.

The case of *Appius and Virginia* is more important, for on the decision as to its genuineness must rest our idea of the width and range of Webster's genius. Except for a few remarkable passages, this excellent play differs in every way from Webster's certain work. The only external evidence is the statement of an unknown publisher in 1654, repeated by Humphrey Moseley in 1659; but Webster's authorship was never doubted till in 1911 Rupert Brooke submitted the play to a careful analysis and finally, on grounds of style and vocabulary, ascribed it to Heywood. The present writer, after carefully considering Brooke's arguments, and comparing the play with Heywood's undoubted works (especially with the *Rape of Lucrece*) is inclined to believe that Brooke has made out his case. If so, we are, in forming our judgment on Webster's powers, limited to the three undoubtedly genuine works, *The White Devil*, the *Duchess of Malfy*, and the *Devil's Law Case*.

The last, though considerably the latest of the three—it is dated 1619 or 1620—may be taken first, and can be easily dismissed. It is a clumsy, involved, inartistic tragicomedy, in which the happy ending is brought about by the violation of all probability. With many reminiscences of the older and better time, it marks the transition to the later and worse fashion of the Caroline drama. Its chief merits lie in occasional flashes of Webster's characteristic murky imagery and daemonic forcefulness of phrase. There are also some touches of a shrewd satirical observation which, though not always dramatic, is in itself exceedingly striking.

But it is on the two great tragedies that Webster's fame must always rest. *The White Devil*, based on actual events of then recent date, was published in 1612, with a preface that interests by its tersely-worded appreciations of contemporary writers; and, as we know that Webster was a very slow worker, may be dated 1610. *The Duchess of Malfy*, founded ultimately on a novel of Bandello's, cannot be later than 1614; for the researches of Charles Wallace have shown that William Osteler, who acted in it, died that year. The two plays, therefore, were written with the combined daring of youth and solid strength of manhood. They have been said to belong to the "Tragedy of Blood," and they certainly have much in common with Kyd's *Spanish Tragedy* on the one hand and with *Hamlet* on the other. But perhaps it would be better—if classify we must—to regard them as a fusion of the Blood-Tragedy with the "Machiavellian" type of which *Othello* is the supreme example—that type in which further use is made of the Elizabethan conception of a contemporary Italy, rich in all the resources of culture, and permeated with all the vices of decadence. In it the essential element is the villain, endowed with matchless cunning, a hatred of good for its own sake, and a plentiful lack of conscience. To the exhibition of this conception Webster brought a certain Juvenalian *indignatio* which informs the work from beginning to end. The dramatic technique, coldly considered, is often lamentable; whole scenes are irrelevant, characters start up at random, and description too often takes the place of action. With every allowance for the fact that the plays were greatly shortened for the stage, these defects are serious, and go far to explain the repugnance of such critics as William Archer. But they are far outweighed by stupendous merits—in fact by the irresistible power of genius, often it is true "sufflaminandus," but conquering every obstacle like a rushing torrent. There is nothing of the icily regular about Webster. He dares all, and either vanquishes or fails. The main secret of his lasting appeal (an appeal perhaps stronger than ever to-day, to a generation that has supped full of the horrors of war) is his accumulation of catastrophe on catastrophe, his sense of the ghastly in little things, his power of symbolic hinting, and what we may call his sublimation of the pathetic into the portentous. To convey all this he has, when at white heat, a gift of brief expression, charged with the fullest meaning, unmatched except in Shakespeare. The famous "Cover her face, mine eyes dazzle, she died young," is only a supreme instance out of scores. In the face of this, criticism has to hold its peace; or, if it speaks at all, takes the form of such imitation as Shelley gives us in the *Cenci*.

Webster's works were edited by Dyce (4 vols., 1830) and inaccurately; W. C. Hazlitt (4 vols., 1857), but all previous editions are superseded by that of F. L. Lucas (4 vols., 1927, bibliog. in vol. I.). *The White Devil* and *the Duchess*, Symonds (1888) and Sampson (1904).

Criticism, Lamb, *Specimens* (1808); Swinburne, *Age of Shakespeare* (1908); Sidney Lee, *Dict. Nat. Biog.* (1899) (needs correction as to facts); Gosse, *Seventeenth Cent. Studies* (1883); Symonds, *Italian By-ways* (1883). On the story of Vittoria Accoramboni, *see* Trollope in *All the Year Round*, 1860.

The most important recent works are E. E. Stole, *John Webster* (1905); Rupert Brooke, *John Webster and the Elizabethan Drama* (1913) (valuable as the appreciation of a poet by a poet), and for its bibliog. and Lucas's introductions (especially on Webster's so-called plagiarisms from Sidney, Montaigne, etc.). (E. E. K.)

WEBSTER, NOAH (1758–1843), American lexicographer and journalist, was born at West Hartford, Conn. on Oct. 16, 1758. He was descended from John Webster, of Hartford, governor of Connecticut in 1656–57, and on his mother's side from Governor William Bradford, of Plymouth. He worked on his father's farm while preparing for Yale, graduated in 1778, taught in village schools, studied law, and was admitted to the bar at Hartford in 1781. In 1783–85 he published at Hartford *A Grammatical Institute of the English Language* in three parts, a spelling-book, a grammar and a reader. This was the pioneer American work in its field and because of its useful simplification of English spelling and its patriotic nature it soon found a place in most of the schools of the United States. During the 20 years in which Webster was preparing his dictionary, his income from the spelling-book was the chief source for the support of his family; and before 1861 the sale reached more than a million copies a year. He did some political writing, and himself regarded his *Sketches of American Policy* (1785) as the first distinct proposal for a U.S. constitution. In 1788 he started in New York the *American Magazine*, but it failed at the end of a year, and he resumed the practice of law at Hartford, where he enjoyed the congenial companionship of the "Hartford wits." In 1793, in order to support Washington's administration and oppose the designs of Genet, he established a daily paper, the *Minerva* (afterwards the *Commercial Advertiser*), in New York and in connection with it a semi-weekly paper, the *Herald* (afterwards the *New York Spectator*). The remainder of his life was spent in New Haven, Conn., and Amherst, Mass., in both places holding various public posts, including membership in the Connecticut House of Representatives and a county judgeship, but he devoted himself primarily to linguistic studies. In 1806 he brought out *A Compendious Dictionary of the English Language* which contained much encyclopaedic information, and in 1807, *A Philosophical and Practical Grammar of the English Language*. He began his great dictionary the same year. In 1824–25 he worked on this in France and

England, finishing his manuscript at the University of Cambridge. *The American Dictionary* came out in 1828 in two volumes. It contained 12,000 words and from 30,000 to 40,000 definitions that had not appeared in any earlier dictionary. An English edition soon followed. In 1840 appeared the second edition, corrected and enlarged. Webster completed the revision of an appendix a few days before his death, which occurred in New Haven on May 28, 1843. Many revisions and abridgments have since appeared. Amongst Webster's other works may be mentioned *Dissertations on the English Language* (1789); *The Rights of Neutral Nations in Time of War* (1802) and *A Collection of Papers on Political, Literary, and Moral Subjects* (1843) and Governor John Winthrop's *Journal* in 1790.

See *Memoir of Noah Webster* by his son-in-law, Prof. Chauncey A. Goodrich, in the quarto editions of the *Dictionary; Noah Webster* (1881), by H. E. Scudder, in "American Men of Letters"; and *Notes on the Life of Noah Webster* by a grand-daughter, Emily E. F. Ford (1912), which contains many letters.

WEBSTER, a town of Massachusetts, U.S.A., on the Maanexit river. Pop. (1920) 13,258 (28% foreign-born white). Within the town's area of 12·19 sq.m. is beautiful Lake Chaubunagungamaug (2 sq.m.). Manufactures of textiles, boots, etc., had a value in 1925 of $14,114,349. Webster was founded by Samuel Slater (1768–1835) who established cotton mills here in 1812 and woollen mills in 1815. The town was formed in 1832 from parts of Dudley and Oxford, and named after Daniel Webster.

WEBSTER GROVES, a city of St. Louis county, Missouri. Pop. (1920) 9,474 (89% native white), and was estimated locally at 16,500 in 1928. It is the seat of Webster college (Roman Catholic; 1916) and of Eden Theological seminary (Evangelical). The city was incorporated in 1896.

WEDEKIND, FRANK (1864–1918), German dramatist, was born in Hanover on July 24, 1864, the son of a doctor. He was educated at his father's château at Lenzburg in Switzerland, and in 1883 took up journalism. Afterwards he became an advertising manager and then, in 1890, secretary of a circus in Paris and London. In 1897 he set up as an actor and producer acting in his own dramas with his wife. His dramatic works include: *Frühlings Erwachen* (1891), *Erdgeist* (1895), *Der Marquis von Keith* and *Die Kammersänger* (1900), *Die Büchse der Pandora* (1903), *Schloss Wetterstein* (1910) and *Franziska* (1911). Wedekind's plays are written in a difficult symbolic style, the characters always representing types rather than individuals. Their preoccupation with erotic themes awoke much opposition, and in savage irony he was conspicuous, serving a term of imprisonment in Munich for *lèse-majesté*. Wedekind also wrote poetry (*Die Vier Jahreszeiten*), novels, *Mine-Haha* (1906), etc., and essays. He died in Munich on March 9, 1918. *See* A. Kutscher, *Frank Wedekind* (1922–24).

His *Works* were published in 8 vols., 1912–19. Certain plays were translated into English by S. A. Eliot, Jr., New York.

WEDGWOOD, JOSIAH (1730–1795), was born on July 12, 1730, and died on Jan. 3, 1795. He was the youngest child of Thomas Wedgwood, a potter, of Burslem, and came of a family of which many members had been notable potters in Staffordshire in the 17th century. Soon after the death of his father in 1739 Josiah learned, and became extraordinarily skilful in, the art of shaping pottery on the wheel.

In 1744 he was apprenticed to his eldest brother, and in 1752 became manager of a small pottery at Stoke-upon-Trent, known as Alder's. Within a year or two he became junior partner with Thomas Whieldon of Fenton, then the cleverest master-potter in Staffordshire, many of whose apprentices afterwards became noted potters. In 1759 he began work on his own account at the Ivy House pottery in Burslem. Salt-glaze and green and yellow glaze seem to have been his first staples. In 1762 he also leased the Brick House, alias "Bell" works, at Burslem. The fine white English earthenware was just reaching perfection, and Wedgwood became one of its best-known makers. He was most active in his efforts for the improvement of turnpike roads, the construction of a canal (the Trent and Mersey) and the founding of schools and chapels. He presented a service of his improved cream-coloured earthenware (to which he gave the name of Queen's Ware) to Queen Charlotte in 1762, and was appointed potter to the queen and afterwards to the king. Next he turned his attention to artistic pottery and found his inspiration in the European renaissance of classic art, fostered by the discovery of Pompeii and the recovery of Greek painted vases from the ancient graves in Campania and other parts of Italy. Wedgwood was particularly successful in this direction, for his "dry" bodies —some of which, like the black and cane bodies, had long been known in the district, while others, such as the famous Jasper bodies, he invented after years of laborious effort—lent themselves particularly well to the reproduction of designs based on the later phases of Greek art. The most famous of Wedgwood's artists was John Flaxman. His works at Hanley were called "Etruria" where his descendants have carried on the business and established a Wedgwood museum of great interest. (*See* CERAMICS.)

BIBLIOGRAPHY.—For detailed accounts of his life *see* Eliza Metyeard, *Life of Wedgwood* (1865–66); L. Jewitt, *Life of Wedgwood* (1865); F. Rathbone, *Old Wedgwood* (1893); A. H. Church, *Josiah Wedgwood: Master-Potter* (1894; new ed., 1903); W. Burton, *History and Description of English Earthenware and Stoneware* (1904); J. C. Wedgwood, *A History of the Wedgwood Family* (1909); F. J. Wedgwood, *The Personal Life of Josiah Wedgwood* (1915).

WEDNESBURY, market town of Staffordshire, England. Pop. (1921) 30,390. An electric tramway connects with Walsall. The church of St. Bartholomew, a fine Perpendicular building, standing high, is supposed to occupy the site of a place of the worship of Woden or Odin, from which the name Wednesbury (Wodensborough) may be derived. There are iron and steel works, producing every kind of heavy goods. Similar industries, with brick-making, are practised at Darlaston, an urban district (pop. 18,208), within the parliamentary borough.

Here Ethelfleda in 916 constructed a castle. The place is not mentioned in Domesday, but appears to have belonged to the barony of Dudley. After the Conquest it became a demesne of the Crown, and was bestowed by Henry II. on the Heronvilles. It became a parliamentary borough in 1867 and a municipal borough in 1886.

WEED, THURLOW (1797–1882), American journalist and politician, was born in Cairo, N.Y., on Nov. 25, 1797. Weed was in 1824 elected to the New York assembly on the John Quincy Adams ticket, serving for a single session (1825). During the excitement over the disappearance of William Morgan (*see* ANTI-MASONIC PARTY), he retired from the *Telegraph* and threw himself with enthusiasm into the attack on the Masonic order, editing for a time the *Anti-Masonic Enquirer*. In 1830 he established and became editor of the *Albany Evening Journal,* which he controlled for 35 years. Supporting the Whigs and later the Republicans, it was one of the most influential anti-slavery papers in the north-east. He died in New York on Nov 22, 1882.

See *The Life of Thurlow Weed* (vol. i., Autobiography, edited by his daughter, Harriet A. Weed; vol. ii., Memoir, by his grandson, Thurlow Weed Barnes, Boston and New York, 1884). The Memoir is especially full for the period 1850–67.

WEED DESTRUCTION. Weeds may be defined as plants growing in the wrong places and the loss due to them may be illustrated by crops of sugar cane obtained in Hawaii under controlled conditions.

	Crop
No fertilizer applied; not weeded . . .	13·19 tons per ac.
„ „ „ crop „ . . .	20·38 „ „ „
Fertilizer applied; not weeded	21·30 „ „ „
„ „ crop „	29·70 „ „ „

The improvement in crop due to weeding was thus seven or eight tons per ac. in each case, and weeding without fertilizing was almost as profitable as manuring without weeding.

On the other hand, there are circumstances, especially in the tropics, where a controlled growth of certain covering weeds amongst the crops serves a useful purpose by preventing undue evaporation of water, or, in the case of leguminous weeds, by increasing the store of nitrogen in the soil by virtue of the nitrogen-fixing bacteria in the nodules on their roots.

Preventive Measures.—The worst annual weeds are prolific seed bearers, and preventive measures lie therefore in

killing the weeds already on the ground before they are able to ripen their seed, and in avoiding the introduction of fresh weeds by sowing cheap crop seed (*see* SEED TESTING) by cleaning agricultural machinery before moving it from place to place and by burning up farm rubbish, rick refuse, etc., instead of scattering it about arable land. Specially harmful seeds, such as dodder (which is parasitic on and destroys leguminous crops) should be entirely barred, and in some countries legislation provides for this. Fully grown perennial weeds such as docks and dandelions, if pulled up when in bud, are still able to flower and ripen seed, and should never be allowed to lie on the ground, but be burnt or reduced to a compost with the aid of lime. One valuable method of prevention is co-operation among neighbouring cultivators in the reduction of the worst weeds in a locality. It is of little use for one man to wage constant war on dandelions and thistles if on adjoining land these weeds are allowed to seed unchecked and distribute themselves afresh.

Principles of Eradication.—Some common annuals, as chickweed, speedwell, spurrey, groundsel, shepherd's purse, etc., ripen seed early, while flowering and fruiting continue over a long period. Other annuals, as poppy and charlock, have a longer growing period before flowering, and so offer more time in which they can be dealt with satisfactorily. Eradication can rarely be completed in one season, as however carefully seeding may be prevented further crops of weeds will spring up in several succeeding years, but if treatment is persevered in, a clearance will ultimately be effected. Perennial weeds persist from one year to another by means of underground parts in which supplies of food are stored up to feed the young shoots when spring growth starts. With these, therefore, the aim should be to remove as much as possible of the subterranean parts, or to exhaust them by cutting off the aerial shoots before the latter have had time to replenish the reserve stores. The underground structures have a remarkable tenacity of life and usually if small pieces are broken off they are capable of growing into independent plants. Perennials also ripen fertile seed, which eradication methods must prevent.

Eradication by Cultural Methods.—The oldest, simplest and, where they can be properly carried out, most effective methods are removing the weeds bodily from the soil by hand-pulling or cutting the plants down with the plough, spade or hoe, either turning them into the soil, leaving them to perish on the surface, or removing them for burning or otherwise destroying them. It is worse than useless to plough or dig in annuals that have already seeded, but wholesale destruction may be effected at earlier stages. Perennials, on the other hand, are broken up by these methods of cultivation, and it is essential that they should be removed as completely as possible by harrowing or raking to prevent the weeds from becoming still more widespread. On light soil many of the weeds may be dragged off with harrow or rake before the ground is ploughed or dug over, particularly where couch grass, twitch or similar weeds are prevalent. Hand- or horse-hoeing is a valuable means of eradication after the crops are growing, and should preferably be done in dry or sunny weather, in order that the weeds may rapidly wither, otherwise they are apt to take root again, thus rendering the labour of no avail. Badly infested land may often be cleared by growing root crops or potatoes for one or two years in succession, as these need much hoeing in the ordinary course of cultivation.

On farms and plantations weeds may be smothered by growing a very dense crop or by mechanical means of covering. Vetches, tares, lucerne and similar crops spread so quickly over the land that the weed seedlings are crowded out by competition as they cannot get enough light for growth. The principle has been adapted in Hawaii for the cultivation of pineapples and sugar cane, broad strips of paper made from bagasse or sugar cane waste being laid down along the rows and penetrated by the crop plants, the weeds being completely smothered. On grassland and lawns small areas infested by dodder, thistles, twitch, daisies, etc., may be covered with tarred paper or a considerable depth of soil for a season or more. All vegetation is suppressed, and re-seeding is necessary when the covering is removed.

Perennial weeds as thistles, sowthistles, bracken, nettles and others that occur under every type of cultivation may be dealt with individually by stubbing or digging out or collectively by cutting down at appropriate times. Cutting should be postponed till the new shoots are well grown, in order to exhaust the underground food reserves as completely as possible. If done too early a number of fresh shoots usually appear in place of the one removed and the weeds become more flourishing. Thistles may be eradicated from grassland in two years by three cuttings during June and July, but if this cannot be managed one cutting about the middle of June is fairly effective.

Badly infested land may be most effectively cleaned by fallowing for a year, growing no crop but keeping the soil continually cultivated with plough and harrow or their equivalents. The weed seeds that are brought to the surface germinate under advantageous conditions, the seedlings are then cut down at the next cultivation, which at the same time brings up fresh batches of seed that in their turn start into growth and meet a like fate. Thus in one season the soil is robbed of large numbers of its buried seeds, and at the same time the perennials are reduced if the harrowing is efficient and the broken parts are gathered up and burnt.

Occasionally certain weeds on cultivated land defy all the usual methods of reduction and it may be necessary to lay the land down to grass for a period of years. Wild onion has been successfully treated by sowing Elliott's mixture, made up of grasses and deep-rooted plants like chicory, burnet and kidney vetch, the ley being left down for about six years. Areas in America infested with the poisonous tall larkspur are valueless for grazing.

In eradicating weeds by cultural methods a well-devised rotation of crops is of extreme value. The diverse methods of cultivation needed by cereals, roots and clovers, coupled with the variation in the times of sowing and harvesting, can be used to advantage in reducing various types of weeds at times when they are most open to attack. The shorter the rotation the more completely can weed growth be controlled, as a species that is reduced by the cultivation of one type of crop is unable to do much towards re-establishing itself before another crop of similar type recurs in the rotation, and the weed suffers still further reduction.

Eradication by Chemical Means.—During recent years advantage has been taken of the difference in habit between certain weeds and crops to kill the weeds with chemical compounds without injuring the crops amongst which they are growing. Solutions of copper sulphate, iron sulphate, sulphuric acid and similar chemicals are sprayed over the affected areas; the mist-like spray clings to the rough surface of such broad-leaved weeds as charlock, dries thereon and kills the plants, whereas it rolls down the more upright and smooth leaves of cereal crops without causing damage. Spraying should be done in fine weather, and the strength and quantity of solution to be applied varies with the weed and the chemicals used. On an average 4 or 5% solutions of copper sulphate and 12 to 20% iron sulphate are effective at the rate of 40 to 50 gal. per ac., but no definite rule can be laid down in this respect. Dandelions can be eradicated from lawns by spraying several times during the season, after mowing, with 20% iron sulphate solutions, and the same has been found effective for dog-daisies in hay fields; better results with some weeds, as wild carrot, are obtained by the admixture of a little molasses to make the spray more adhesive. Recent experiments indicate that about 270 gal. of 10% sodium chlorate solution per ac. will completely eradicate thistles, but the economic side of this has not yet been worked out. A 12·5% solution is also very promising against field bindweed (*Convolvulus arvensis*), three sprayings being best if the infestation is heavy. Sulphuric acid has proved efficient in 2% solutions at 107 gal. per acre. Similar results can be obtained with much stronger solutions of certain artificial fertilizers, which are used in this way instead of being applied directly to the soil. Corn buttercup, spurrey and charlock can be killed with 1½ to 2 cwt. ammonium sulphate in 60 gal. water per ac.; this cannot be used if clover is included with the crop, as that also is killed. Other manures have a similar action on certain weeds. Chemicals and manures may also be used in the dry state with good results, if they are applied as very fine powder when the leaves are moist with rain or dew. Wild radish (*Raphanus raphanistrum*) may be

reduced by dusting with 1 to 1½ cwt. calcium cyanide per ac., while kainit, at 6 cwt. per ac., is very useful against charlock and various other weeds if spread about Feb. or March.

Control by Biological Methods.—In some countries where certain weeds cover vast areas and cannot be dealt with by ordinary means attempts are being made at eradication by the encouragement of insect pests which are specifically harmful to these particular weeds. In Australia much progress has already been made in the reduction of the obnoxious prickly pear (*Opuntia sp.*) by the introduction from America of types of insects which feed on various parts of the plant. Research is also being made into the possibility of control by means of fungoid and bacterial diseases.

In the Hawaiian Islands several insect species have been introduced during the last 25 years to attack *Lantana,* with such success in the drier regions that it is now difficult to realize how widespread the weed originally was. Experiments on similar lines are in progress with regard to the reduction of such weeds as blackberry, nutgrass, gorse, St. John's wort and ragwort, all of which are serious pests in certain areas. Special precautions are needed in connection with this work in view of the possibility that the introduced insects may prove harmful to the crops.

BIBLIOGRAPHY.—W. E. Brenchley, *Weeds of Farm Land* (1920); G. H. Clark and J. Fletcher, *Farm Weeds of Canada* (Canad. Dept. of Agriculture, 1909), contains descriptions of many widespread weeds, coloured illustrations; H. C. Long, *Common Weeds of the Farm and Garden* (1910), *Plants Poisonous to Live Stock* (1924); R. Morse and R. Palmer, *British Weeds* (1925). (W. E. BR.)

WEEDS. While there are more than 200,000 species of plants hardly more than a hundred of these are really troublesome weeds, because a very small percentage of all plants are able to reproduce and thrive in the presence of cultivation and other interfering agricultural operations. Most wild plants succumb quickly to such interference. Pammel has estimated that in Iowa alone weeds cause an annual loss of $25,000,000. The prickly pear, several species of *Opuntia,* cost South Africa and Australia many million dollars a year.

(1) Annual weeds generally produce a great number of seeds. A large cocklebur plant bears as many as 8,500 seeds; Jimson weed, 8,500, and green foxtail, 5,000. A given crop of seeds in the ground does not all germinate in one year, but the germination is distributed over many years. Doctor Beal's work on buried seeds at Michigan Agricultural college shows that out of 23 common species of seeds, mainly weeds, buried in the earth in moist sand for *forty years,* the following ten still had live seeds capable of germination in the percentage indicated in the table.

	Percentage Germination
Brassica nigra, black mustard	18
Oenothera biennis, evening primrose	38
Rumex crispus, curly dock	18
Portulaca oleracea, purslane	2
Plantago major, common plantain	10
Amaranthus retroflexus, coarse pigweed	2
Amaranthus graecizans, tumbleweed	66
Lepidium virginicum, large peppergrass	2
Ambrosia elatior, hogweed	4

The U.S. Department of Agriculture is carrying on very extensive experiments to determine the length of time that various seeds can lie in the soil still dormant but capable of germination. One hundred and seven species were buried including many cultivated as well as wild forms. These were buried at three different depths (8, 22 and 42 in.) with enough duplicates to continue the studies for many years. The last test was made after *twenty years* in the soil. The following conclusions are drawn from this work:

The depth at which the seeds were buried had little effect upon the preservation of their vitality. Cultivated plants appear to depend largely upon human agencies for their perpetuation. None of the cereals or legumes whose seeds are used as food germinated on being dug up. The seeds of weeds or wild plants survived better than those of cultivated plants. The weed seeds showing the highest germination and the fewest failures were all from common and persistent weeds in the locality of Arlington, Va. The docks, lambs' quarters, plantains, daisies, poke, purslane, jimson and ragweed are examples. Of the 107 species buried in 1902, 71 grew in 1903 after one year, 61 grew in 1905 after 3 years, 68 grew in 1908 after 6 years, 69 grew in 1912 after 10 years, 50 grew in 1918 after 16 years, and 51 grew in 1923 after 20 years. The seeds of most weeds, when ploughed under, will not perish during the period of any normal crop rotation.

Ohga, a Japanese botanist, has recently discovered seeds of East Indian lotus that have remained in a peat stratum of a naturally drained lake bed of Manchuria for several centuries all still capable of vigorous germination. This is the longest-lived known seed.

(2) Weed seeds or fruits are generally well provided with means of dispersal. Many fruits have pappus or wings that give wide distribution by the wind. Here may be mentioned all sorts of thistles, dandelions and prickly lettuce. Others bear burs or hooks that catch in the wool or hair of animals and the clothing of man and are thus dispersed. In the Russian thistle, tumbling pigweed, and others the plants break off at the ground level and roll before the wind thus distributing their seeds. Gooseberry, currant and other seeds of fleshy-fruited plants pass through the alimentary canals of birds and other animals without being entirely destroyed and are scattered by this means. A percentage of the smaller sorts of seeds of dry-fruited weeds escape destruction in a similar way. So while birds and animals do much good by destroying many weed seeds they do harm by distributing others that are not destroyed in their alimentary canals. Weeds are also distributed by the seeds, fruits or weed refuse floating on water.

Perhaps the most serious means of weed distribution is through shipment of commercial seeds. Such shipments often occur between the most remote parts of the world and thus provide very wide distribution. In 10 oz. of fenugreek (*Trigonella foenum-graecum*) seeds imported into the United States from south Europe, Kennedy and Frederick found 18 species of weed seeds of 9 different orders of plants ranging from 1 to 150 seeds of each species. Weed seeds of about the same size as commercial seeds are especially difficult to remove and are likely to be distributed in commercial seeds. The general distribution to south Africa, temperate Australia, New Zealand, and temperate America of the following very pernicious native European weeds has no doubt largely occurred in this way; European bindweed, quack grass, crab grass, Russian thistle, sow thistle, prickly lettuce, sheep sorrel, dodders, several species of plantain, wild carrot, common dandelion and bull thistle.

(3) The third thing that makes weeds hard to combat is the persistent, spreading underground parts of biennials and perennials. Quack grass, generally distributed over the temperate zones, and Johnson grass, a native of Europe and a very serious weed of southern United States owe their marked persistence to rapidly spreading and numerous underground stolons capable of regenerating new plants from small fragments of their rhizomes; sow thistle, Canada thistle, sheep sorrel and many other weeds have underground stolons. The common dandelion is an excellent example of a weed that persists by regeneration of a plant from a portion of a tap root. A small portion of any part of the tap root will regenerate numerous buds capable of growing up through several inches of reasonably loose soil. The removal of a large portion of the tap root from a lawn will not insure destruction.

Transported Weeds.—Europe is by no means the sole source of the world's bad weeds. The prickly pears of south Africa and Australia are natives of tropical and sub-tropical America. Several of the pigweeds and *Galinsoga parviflora,* a very troublesome little annual weed of Europe and North America, were introduced from tropical America. The latter persists because the plant matures from seed in a few weeks and keeps the soil continuously supplied with an abundance of germinating seeds. Guam under the commercial activity of the last 30 years is very rapidly acquiring most of the pernicious weeds of other tropical regions. Commerce will gradually distribute pernicious weeds to all regions in which they can thrive.

How Weeds Are Injurious to Agriculture.—Some of the ways in which weeds injure economic plants are very evident. They crowd out crop plants either by root competition or by overgrowing and shading them. In semi-arid and sub-humid regions and even in humid regions at dry times they rob the crops of needed water. All weeds absorb mineral nutrients and are likely to leave the crop short of these. The pigweed (*Amaranthus retroflexus*) and others are vigorous absorbers of nitrates and rob the crops of this important nutrient. Climbing weeds like the wild morning glory and bindweed pull down crops. The dodders are

parasites on crop plants, withdrawing water and food materials from them. Weeds that have seeds of about the same size and weight as the crop reduce the value of the seed crop by being costly or impossible to remove from the economic seeds. This is true of dodder and buckthorn in clover, of great ragweed and cockle in wheat, and of wild oats in oats.

There is one weed that literally takes the ground from other plants and even from man. This is the prickly pear (several species of *Opuntia*) in certain regions of South Africa and Australia which was introduced as a source of succulent stock feed.

Weeds harbour or shelter insects and nematodes. The cut worms are especially bad in gardens and corn fields adjoining grass lands. The destructive squash vine borers breed on wild cucumber and move later to the squash; cabbage aphids and cabbage curculios breed on species of wild mustard and later attack cabbage; rhubarb curculio feeds on curly dock and later attacks rhubarb; chinch bugs over-winter on grasses and sedges and move from these to small grains for oviposition in the spring. From the small grains they move to corn in the corn belt of the United States. This has done much to eliminate the growing of small grains in the corn belt. It is important to keep cultivated land and its borders as free as possible from weeds and rubbish that may feed or shelter insect pests. Weeds also harbour plant diseases. This is well illustrated by the barberry and *Ribes* as alternate hosts of stem rust of wheat and the white pine blister rust respectively. The disease, aster yellows, over-winters in the perennial sow thistle or common plantain and several other perennials and is transmitted by a specific leafhopper (*Cicadula sexnotata*) to the annuals, China aster or lettuce. Finally, many weeds of the ranges and even some of farm pastures are very poisonous and kill or greatly injure stock when they are eaten. Here may be mentioned the stemless loco (*Oxytropis Lamberti*), woolly loco weed (*Astragalus mollissimus*), and cowbane (*Cicuta maculata*). Loco weeds have been the source of enormous losses in the ranges of America, South Africa and Australia. Many of our weeds are slightly poisonous and may prove fatal if animals are forced by hunger to eat them in large quantities. (*See* POISONOUS PLANTS.) Other weeds do minor damage, such as tainting milk, or supplying wool with burs.

WEEHAWKEN, a township of New Jersey. Pop. (1920) 14,485; 1928 local estimate 18,500. It is a narrow strip along the Hudson, at the southern extremity of the Palisades. On a ledge below the crest of the Palisades is the famous duelling ground which was the scene of the encounter between Hamilton and Burr. Weehawken was incorporated in 1859. The name is an Indian word, said to mean "maize land."

WEEK, the name given to periods of time, varying in length in different parts of the world, but shorter than a "month" (from A.S. *wicu,* Germanic *wikôn,* probably "change," "turn"). The month may be divided in two ways: a fractional part may be taken (decad or pentad), as in east Africa or ancient Egypt (moon-week), or the week may be settled without regard to the length of the month (market-week, etc.). The seven-day week (*see* CALENDAR) originated in west Asia, spread to Europe and later to north Africa (Mohammedan). In other parts of Africa three, four (especially in the Congo), five, six and eight (double four) day weeks are found, and always in association with the market.

In ancient Scandinavia a five-day period was in use, but markets were probably unknown. That the recurrence of the market determined the length of the week seems clear from the Wajagga custom of naming the days after the markets they visit, as well as from the fact that on the Congo the word for week is the same as the word for market. Among agricultural tribes in Africa one day of the week, which varies from place to place, is often a rest-day, visiting the market being the only work allowed.

WEEKS, JOHN WINGATE (1860–1926), American public official, was born at Lancaster, N.H., on April 11, 1860. He graduated from the U.S. Naval Academy in 1881, and became assistant land commissioner of the Florida Southern railroad. In 1886 he helped to organize the banking and brokerage firm of Hornblower and Weeks, Boston, Massachusetts, of which he was a member until 1912. In 1890 he joined the Massachusetts naval brigade, and he served in the Spanish-American War. During 1905–13 he took an active part in framing the Aldrich-Vreeland Currency bill. In 1913 he entered the U.S. Senate, but was defeated for re-election in 1919. In 1921 he entered the cabinet of President Harding as Secretary of War, serving also in the same post under President Coolidge. He died at Lancaster, N.H., on July 12, 1926.

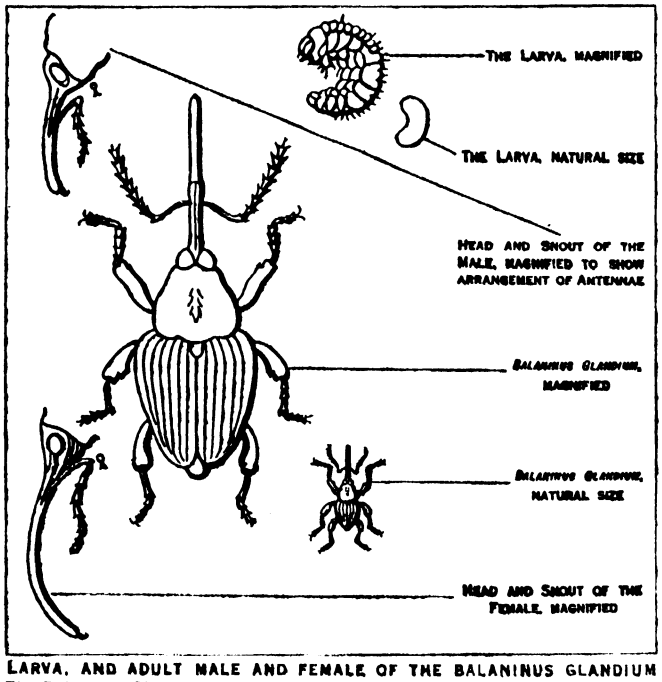
WEELKES, THOMAS (d. 1623), English madrigal composer. His name first appears in connection with the publication of his first book of madrigals for three, four, five and six voices in 1597; and as he alludes in 1598 to his "yeeres yet unripened" in a volume of *Balletts and Madrigals,* dedicated to Edward Darcye, groom of the privy chamber, his birth may be placed somewhere between 1570 and 1580. He was at one time organist of Winchester college, and on July 16, 1602, took his degree of Mus. B. from New college, Oxford. An appointment as cathedral organist at Chichester followed, and the rest of his life was probably spent in that city. There is a six-part madrigal, "As Vesta was from Latmos," in the *Triumphs of Oriana* (1601), a famous collection by Thomas Morley, to whose memory Weelkes paid a tribute in his "a Remembrance of his Friend Thomas Morley" in *Ayeres or Phantastique Spirites* (1608). Weelkes's will was made on Nov. 30, 1623, and he probably died on that day, as his burial took place on Dec. 1, 1623, at St. Bride's, Fleet Street, London. In 1923 tercentenary tablets were placed in that Church, at Winchester, and at Chichester.

In addition to the above-mentioned publications, Weelkes brought out a set of five-part and another of six-part madrigals in 1600. In the latter part of his life he wrote a great quantity of church music, of which very little has been printed. This includes 32 anthems, and six services. His first book of madrigals was reprinted in 1843 by the Musical Antiquarian Society. "Grace, my lovely one" was edited by W. Barclay Squire from the ms. in the British Museum. The *Balletts and Madrigals* (1598) and the *Ayeres or Phantastique Spirites* (1608) were published in Arkwright's *Old English Edition* (1889–1902). Weelkes also wrote a few pieces for viols.

WEENIX, JAN BAPTIST (1621–1660), Dutch painter, the son of an architect, was born in Amsterdam, and studied first under Jan Micker, then at Utrecht under A. Bloemaert, and at Amsterdam under Moijaert, and finally, between 1643 and 1647, in Rome. In that city he acquired a great name and worked for Pope Innocent and Cardinal Pamphili. He returned to Holland in 1649, in which year he became master of the gild of St. Luke at Utrecht, where he died in 1660. He was a very productive and versatile painter, his favourite subjects being landscapes with ruins and large figures, seaports, and, later in life, large still-life pictures. His son Jan, Berchem, and Hondecoeter were his pupils.

His son, JAN WEENIX (1640–1719), was born at Amsterdam and was a member of the Utrecht gild of painters in 1664 and 1668. His fame is chiefly due to his paintings of game and of hunting scenes, and many of the pictures of this genre, formerly ascribed to the elder Weenix, are now generally considered to be the works of his son, who even at the age of 20 rivalled, and subsequently surpassed, his father in breadth of handling and richness of colour. At Amsterdam he was frequently employed to decorate private houses with wall-paintings on canvas; and between 1702 and 1712 he painted an important series of large hunting pictures for the Prince Palatine Johann Wilhelm's castle of Bensberg, near Cologne. Some of these pictures are now at Munich. He died at Amsterdam in 1719. Many of his best works are to be found in English private collections, though the National Gallery has but one example, a painting of dead game and a dog.

WEEVER, or WEAVER. The weevers (*Trachinus*) are small marine fishes common on the coasts of Europe. They belong to a family of spiny-rayed fishes (*Trachinidae*), and are distinguished by a long low body with two dorsal fins, the anterior of which is composed of six or seven spines only, the posterior being long and many-rayed. The ventral fins are placed in advance of the pectorals. The upper surface of the head is bony, without skin.



Several species are known, but two only occur on the British coasts, viz., the Greater Weever (*Trachinus draco*) and the Lesser Weever (*T. vipera*); the former is frequently found of a length of 12in., whilst the latter grows only to about half that length. The colouration of both is plain, but the short first dorsal fin is always deep black. The weevers are bottom fish, burying and hiding themselves in the sand or shingle—the lesser species living close inshore and the greater preferring deeper water. They inflict wounds by their dorsal and opercular spines. The spines are deeply grooved, and the poisonous fluid lodged in the grooves is secreted by glands at their base. The flesh is not bad eating.

See Jordan, *Guide to the Study of Fishes.*

WEEVIL, the name applied to beetles of the division *Rhynchophora* of the order *Coleoptera.* They are characterized by the prolongation of the head into a rostrum or snout which bears the mouth-parts at the apex. The antennae are usually elbowed and clubbed, with the basal portion frequently lodged in a depression on each side of the rostrum. The tarsi have four evident joints and there is a single median or gular suture beneath the head. Their larvae are usually white, curved, fleshy grubs, generally without legs: the head is darker and well developed, with strong jaws; eyes are absent or very rudimentary. Both the adults and the larvae are exclusively vegetable feeders.

The true weevils or *Curculionidae* form the largest natural family in the animal kingdom and include over 25,000 known species, but probably many times that number still await discovery. More than 400 species occur in the British Isles, and upwards of 1,400 species inhabit America N. of Mexico. Their most characteristic organ is the rostrum: its function in the female is often that of a boring instrument, a hole being drilled by it for placing the eggs, but its significance in the male is not understood. As a rule the rostrum is better developed in the female than in the male, a feature that is well seen in the nut weevils. The majority of weevils are sombrely coloured but others are attractive objects. In the brilliant green *Phyllobius* and *Polydrusus,* so common among herbage in Britain, the colour lies in the covering scales. The Papuan *Eupholus* is sky blue, and the diamond-beetles (*Entimus*) of Brazil are probably the most resplendent of all. In their larval stages weevils may feed upon any part of a plant from the roots to the seed: the vast majority are internal or subterranean feeders, but some feed openly and a few live in tunnels formed of rolled leaves. A large number of species are highly injurious either as larvae or as adults also. The granary weevil (*Calandra granaria*) destroys the grains of maize, wheat and barley, and has become widely distributed through commerce. The cosmopolitan rice-weevil (*C. oryzae*) affects, besides rice, a great variety of other dry food products. The cotton-boll weevil (*Anthonomus grandis*) is the most serious enemy of the American cotton crop, causing immense damage to the bolls. It is believed to have entered Texas about 1892 from tropical America and reached Virginia by 1924. The allied apple-blossom weevil (*A. pomorum*) is very destructive to unopened blossom buds in England and other parts of Europe. The palm-weevil (*Rhynchophorus ferrugineus*) affects toddy and coco-nut palms, and the pine-weevil (*Hylobius abietis*) is a European enemy of young conifers. The alfalfa-weevil (*Phytonomus posticus*) entered the U.S. from Europe in 1904 and is a serious enemy of alfalfa and clovers. Mention must be made of the North American plum curculio (*Contrachelus nenuphar*), a most destructive pest of stone fruits, of the nut-weevils (*Balaninus*) and of species of *Sitona* which attack leguminous crops.

In addition to the *Curculionidae,* the *Rhynchophora* include the families *Scolytidae* or bark-beetles, *Brenthidae* and *Anthribidae,* which are described in the article COLEOPTERA. (A. D. I.)

LARVA, AND ADULT MALE AND FEMALE OF THE BALANINUS GLANDIUM
The Balaninus Glandium is closely allied to the common nut weevil of Great Britain. In several species of its genus the female deposits an egg inside a hazel nut or acorn, the larva when developed feeding upon the kernel. The species illustrated hatches out from acorns

WEIERSTRASS, KARL (1815–1897), German mathematician, was born at Ostenfelde on Oct. 31, 1815. He studied jurisprudence at Bonn, and later went to Münster to study under Gudermann, who was interested in the theory of functions. Weierstrass wrote a paper on the development of modular functions for his teacher's examination, and so started the work in mathematics with which his name is associated. He became a teacher of mathematics at the "gymnasium" at Deutsche-Crone (1842–48) and then at the Collegium Hoseanum in Braunsberg (1848–56). In 1856 he was appointed extraordinary professor of mathematics at Berlin and lecturer at the school of technology. He was appointed ordinary professor in 1864. He died in Berlin on Feb. 19, 1897.

Weierstrass' work in mathematics was mainly on the theory of functions; his was the most notable work on this subject since that of Abel and Jacobi. He published very little himself, but embodied his works in his lectures. These were taken down by the students and afterwards collected in *Gesammelte Abhandlungen;* vols. i., ii. and iii. (1894–95 and 1903) contained his lectures, vol. iv. (1902) on Abelian functions, vols. v. and vi. (1915) on elliptic functions, vol vii. on the calculus of variations, and vol. viii. on analytic functions. He worked on the functions of real variables, devised tests for the convergence of series, and dealt with converging infinite products. He also dealt with the theory of bilinear and quadratic forms. Weierstrass developed the theory of functions of complex variables to such an extent that he put this subject on a fresh basis. He also made notable contributions to the theory of periodic functions, elliptic functions and the calculus of variations. Although his work was on pure mathematics, he was interested in its applications, and influenced a number of his students to work on applied mathematics.

He edited Steiner's *Gesammelte Werke* (2 vols., 1881–82), and was co-editor with Kummer of *Crelle's Journal.*

WEIGALL, ARTHUR EDWARD PEARSE BROME (1880–), British Egyptologist and author, was born on Nov. 20, 1880, and educated at Hillside school, Malvern, and at Wellington college. After a short time at New College, Oxford (1900), he joined the Egypt Exploration fund as assistant to Prof. Flinders Petrie, and later (1905) was appointed inspector-general of antiquities under the Egyptian Government. He retired in 1914, but continued to write on archaeological subjects. He received several foreign decorations for his archaeological work.

His many publications include *A Report on the Antiquities of Lower Nubia* (1907); *Travels in the Upper Egyptian Deserts* (1909); *The Life of Akhnaton, Pharaoh of Egypt* (1910, revised 1922); *The Life of Cleopatra, Queen of Egypt* (1914, revised

1924); *Egypt from 1798 to 1914* (1915); *Ancient Egyptian Works of Art* (1924); *A History of the Pharaohs* (vol. i. 1925, vol. ii. 1926); *Wanderings in Roman Britain* (1926); *The Grand Tour of Norman England* (1927).

WEIGHING MACHINES. This article deals with mechanisms used for weighing goods and commodities, or used for technical purposes other than those for which the fine balance is constructed. The latter instrument is fully dealt with in the article BALANCE, and to that article the reader is also referred for a discussion of the principles which underlie the construction of the balance beam and determine its accuracy, sensitivity, period of vibration and so forth. The beam-scale, or simple balance is, however, used for commercial as well as for scientific purposes; hence a brief account of the principal forms is here given.

The Beam Scale: Its History.—It seems certain that the balance originated in pre-dynastic Egypt, and in the opinion of some Egyptologists its invention dates back to over 5,000 years before the Christian era.

The earliest balances of which we have knowledge were of the cord-pivot type, the beam being suspended at its centre by a cord attached to a fixed support and the scale pans similarly suspended from the ends of the beam. At first, to effect these attachments, holes were drilled diametrically through the beam, but at a period which may be as early as 2000 B.C., a great improvement was initiated which enabled balances of considerable precision to be constructed. The end-pivot was formed by drilling a hole into the upper surface of the beam and connecting it with one drilled longitudinally into the end. The suspension cord issuing from the latter and secured above the former hole was always held by the weight of the scale-pan in definite contact with the end of the beam. Any inequality of arm-length could be quickly corrected. The central pivot, or fulcrum, was either constructed by drilling diametrically through the beam, or by wrapping the suspension cord round the beam, or by attaching the cord to a metal ring secured to the upper surface of the beam. The better type of Egyptian balance, as early as 1500 B.C., and possibly much earlier, was always suspended from a bracket projecting from a substantial standard. From this bracket a plumb-line was hung, the heart-shaped plumb-bob of which was placed immediately below the tip of a downward-depending tongue ("finger" or pointer) of triangular shape, secured to the beam at its centre.

At a later date, and for ordinary commercial purposes, a more portable type of beam was used, like that depicted on the *kylix* of Arcesilas, a Spartan vase dating from about 550 B.C. The lotus-shaped ends of the beam are here retained, but the beam is depicted as hung, by a simple sailors' device, from the lowered yard of the ship, on the deck of which the king is seated superintending the weighing and loading of a cargo of silphium. This balance is neither equipped with tongue nor plummet. The ancient method of constructing the cord-pivot beam has survived in India and China to the present day.

The balance used in classical times was often constructed on Egyptian lines, but those examples which have survived are almost entirely of bronze, and are of a quite different type which possibly originated at Alexandria in Ptolemaic times. The pivots in these instruments may best be described as hole- or ring-pivots, and were formed by linking hooks or rings through holes pierced through the beam. These ring-pivot instruments stand for a gain in portability and convenience, but for a retrograde step in accuracy of weighing.

At first no fork ("gallows," "shears," or "cheeks") was used, as this device had not been invented. In its place a metal hook or loop of cord was attached to a ring linked through a central hole.

Later, probably about the commencement of the Christian era —but the date is quite uncertain—the fork was invented, and, being itself suspended, enabled an upward-pointing tongue to be fitted. In all these classical balances the middle, or fulcrum pin, was apparently never secured to the beam, but to the fork. The beam turned loosely on a pin attached to the fork.

It is a remarkable fact that in the case of the steelyard in some surviving examples (of which one is now in the British Museum) we find a fixed fulcrum pin secured between lugs shaped in the body of the beam. It would appear that it was not till towards the close of the middle ages that such a pin, approximating to the modern knife-edge, was used in equal-armed balances.

Bullion Balances.—The finest type of large balance constructed in 1929 is used for weighing gold and silver. It is really a large precision balance and the principles of its construction need not here be detailed. Very great care in design is necessary owing to the magnitude of the stresses to which the parts are subjected. In particular, the design of the relieving cam and the whole of its connected parts demands technical skill of a high order.

In the modern form of bullion balance care is taken to preserve the structural rigidity of the beam by causing the continuous plane bearing-piece to pass through an aperture in the framework of the open trussed beam, and thus give support to the continuous fulcrum knife-edge. This means that the bearing-piece has to bridge over a space between two supporting columns, and, in order to ensure freedom from distortion under load, very great transverse rigidity is necessary.

For ordinary commercial purposes, box-end, Dutch-end, and "brass-agate" beams are still often used, but the continuous knife-edge with continuous bearing is gradually displacing less accurate forms of pivot.

Counter Machines, or Small Linked Mechanisms.—It is convenient for most commercial purposes to use scales in which the scale-pans are placed above the beam. In the United States such machines are known as "counter trip scales." To effect this end, linked mechanisms have had to be devised which maintain the pans always in a horizontal position, and give accurate weighing irrespective of the position thereon of the load and weights. This means that each pan must be supported so that a load, wherever

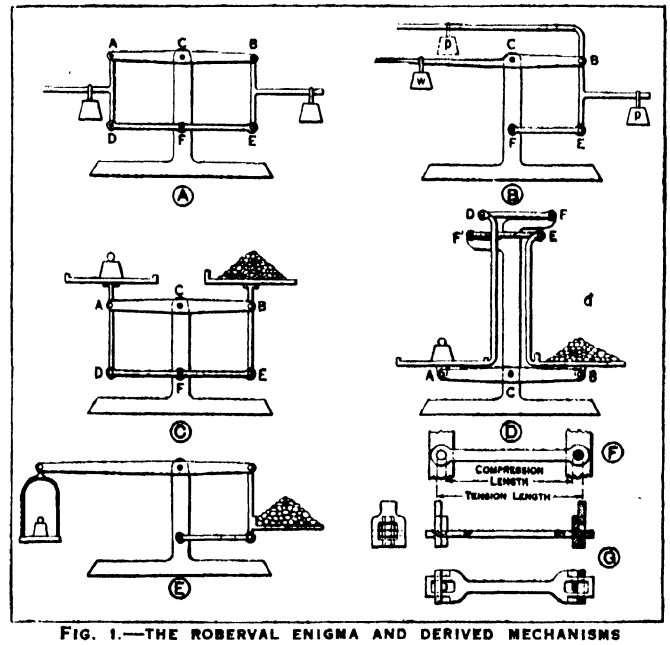

FIG. 1.—THE ROBERVAL ENIGMA AND DERIVED MECHANISMS

it is placed, will exert the same turning moment round the centre of oscillation of the main beam. This may be effected in various ways, the object in all cases being to give to every part of a pan or platform the same virtual velocity.

Two chief groups of mechanisms may be recognized, viz.: (1) Those directly derived from the *énigme statique* (fig. 1*a*) of the French mathematician, Gilles Personne de Roberval, and (2) those consisting of a combination of load-carrying levers adapted to support the scale-pans in such a manner as to comply with the specified conditions (fig. 2). Roberval invented his static enigma

in 1669, but no completely satisfactory explanation of its action appears to have been formulated until Poinsot published the 3rd edition of his *Élémens de Statique* in 1821. His explanation is based on the theory of couples, and has the advantage of being immediate and self-contained.

D'Alembert, in his article on the lever in the *Encyclopédie* of 1750, had attempted a similar type of solution without complete

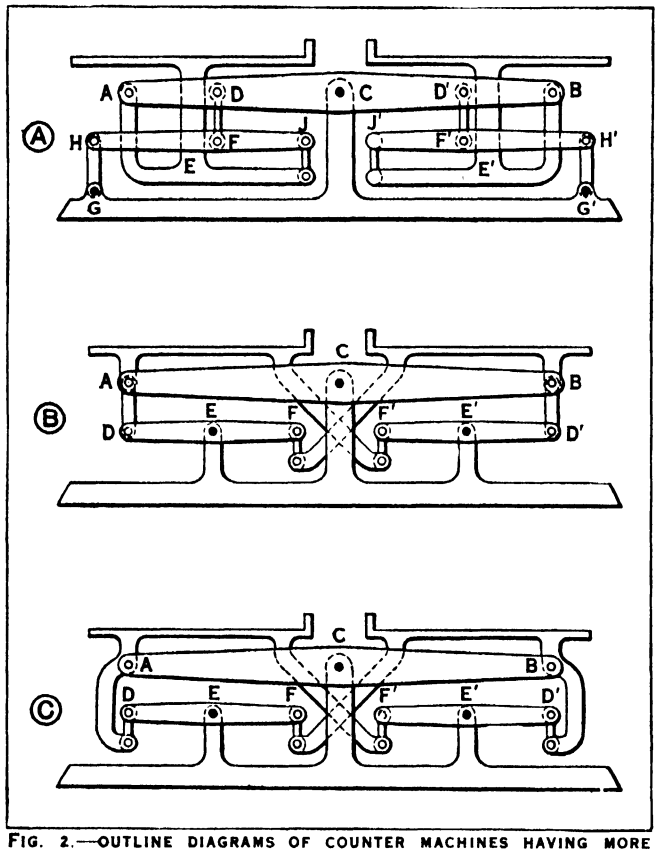

FIG. 2.—OUTLINE DIAGRAMS OF COUNTER MACHINES HAVING MORE THAN ONE WEIGHING LEVEL

success. On the other hand, Newton had long previously, by the enunciation of his principle of Virtual Velocities, provided all the data for solving the problem, though he has left no note on the subject. J. T. Desaguliers applied Newton's principle to the enigma in his *Course of Experimental Philosophy* (2nd ed., London, 1745), and showed that in such a balance the turning moments exerted by the weights on each side of the centre are proportional to their virtual velocities multiplied by their mass, and not proportional to their distance from the centre of rotation. The original form of the enigma is shown in fig. 1*a*, while *b* shows a modified form using one parallelogram only.

In fig. 2*a*, AB is an equal-armed beam pivoted on a knife-edge at C. AD and BE are vertical members pivoted with as little friction as possible to the beam and also to the link DFE, which latter is pivoted to the frame at F, the whole linkage forming two parallelograms. To the vertical legs are rigidly secured two bars from which equal weights are adapted to hang. These bars need not be fastened to the middle of the legs, nor need they project horizontally. If the parallelograms are truly equal, the balance will remain in equilibrium no matter what the position of the equal weights on the bars. It is obvious that, since the legs rise and fall vertically, the virtual velocities of the weights for any given change of inclination of the beam AB are independent of the distance of the weights from C, and are equal to each other; and it can be shown that, this being so, the balance of the system must remain undisturbed when the positions of the weights are changed. Considering the problem in the light of the principle of work, it is clear that, for a given inclination of the beam the vertical displacement of the weights is irrespective of their distance from the fulcrum C of the beam. Under such conditions equilibrium is not disturbed by moving the weights along the bars.

Any divergence of the linkage from perfect parallelism destroys the characteristics of the balance; and it is important to observe that the susceptibility to derangement through lack of equality in the lengths of the parallel members is much greater as regards the vertical legs than as regards the horizontal lever-arms and links.

Fig. 1*b* shows a form of the device in which both weights may be placed spatially on the same side of C, though kinematically *p* is on the opposite side to *w*. A balance based on this form was made by Phitzer of Oschatz. The two principal counter machines which have been constructed on the basis of the Roberval enigma are indicated in outline in figs. 1*c* and 1*d*, and do not require detailed description. Type 1*d*—the "inverted Roberval"— is the better form, as the long vertical legs reduce the magnitude of the alternating tensional and compressive stresses in the "stays" or links DF and EF′.

In order to ensure that the parallelograms retain their true shape under load it is important that the attachment of the leg to the scale-pan supports should be very rigid. In fact, good weighing with this type of balance depends on thoroughly sound design and construction.

Reference has been made to the alternation of stress in the stays or "checks" due to varying positions of the load or weights. Unless a special type of pivot be employed, providing line-contact on one and the same line irrespective of whether the stay is in tension or compression, a reversal of stress will always be accompanied by a change in the effective length of the stay, and, consequently, by a distortion of the parallelogram in question. This is shown in fig. 1*f*. The beautiful kinematic pivot by which this distortion is prevented is shown diagrammatically in fig. 1*g*. Such stays require to be made with great accuracy to give satisfactory service in modern self-indicating balances, where any minute differences of load-effect due to variation in the position of the load are directly visible on the chart. To avoid reversal of stress in the stays the form of balance shown in fig. 1*e* has been devised and occasionally manufactured. Other forms have been constructed. In American practice, round hardened steel pins are generally used as pivots for the stays or "checks"—a cheaper form of construction. American counter machines are also generally equipped with a graduated steelyard, called a side-beam, placed parallel to the scale-beam and carrying a suitable poise. By moving this poise to the appropriate notch a balance may be obtained without the use of small fractional weights. A 16-lb. capacity scale would have a side-beam of 1 lb. capacity graduated in ¼-oz. sub-divisions. The use in retail trade of such counter scales is not allowed in England.

Of counter machines in which more than one load-carrying lever is employed to keep a scale-pan always parallel to itself throughout its permitted range of movement, the most typical is probably that of Beranger, a French scale manufacturer, who patented his device in the United Kingdom in 1849. This beautiful linkage is represented diagrammatically in fig. 2*a*, where ACB is the main beam, of which, as in all these diagrams, only one of the two side members is shown. At D and D′ are pivots equally spaced from the fulcrum C. To the links DF and D′F′ are suspended the subsidiary levers HFJ and H′F′J′, anchored to the base plate respectively by links HG and H′G′, and serving to support, by means of the links hanging from J and J′, the "cradles" E and E′, which latter are also suspended from pivots A and B of the main beam. By pillars rigidly attached to the cradles the scale-pans are conveniently supported above the levers. Considering the left half of the beam, the short arm DC bears the same ratio to the long arm AC, as the short arm HF of the subsidiary lever HFJ does to the long arm HJ of the same. Hence it follows that, when the balance vibrates, if D falls 1 in. and A 2 in., J will also fall 2 in.; consequently, the cradle E, together with its scale-pan, will move parallel to itself, and the load, or any part thereof, will produce the same turning moment about C whether it be transmitted directly to the main beam through A or indirectly

through J, F and D. Precisely the same considerations hold in respect of the other half of the mechanism.

Another type of balance, very similar in principle to the Beranger, and much used in European countries, is the Phanzeder. In fig. 2*b* the earlier type, using compression links AD and BD′, is shown. The subsidiary levers DEF and D′E′F′ are equal-armed, and it will be observed that each scale-pan has one leg supported by a pivot, A or B, of the main beam, and the other leg supported by a link from a pivot of the subsidiary lever on the opposite side of the fulcrum.

Obviously, to avoid friction, since the arcs described by A and D, or B and D′ are of different radii, AD and BD′ must be pivoted links, and not rigid projections from the scale-pans. Obviously, too, they are in compression. British practice, as also American, is generally opposed to the use of such compression links, which, nevertheless, when correctly designed and constructed, are quite reliable. A form of the Phanzeder balance in which only links in tension are used is shown in fig. 2*c*.

The Steelyard.—This instrument, designed as a portable weighing device dispensing with the necessity for using a large number of weights, must be regarded as in all respects of a secondary or derivative nature when compared with the balance. The English word has probably nothing whatever to do with either "steel" or "yard," being derived from the M.L.German word *stâlhof*, sample courtyard, the name for the London depôt of the Hanseatic merchants, where they displayed samples of their goods, and where numbers of such instruments were in use. In America, and in the British dominions, steelyards, especially when suspended from a tripod, are often known as "Weighmaster beams."

The principle of operation of the modern or Roman steelyard may be gathered from the diagram, fig. 3. AB is the steelyard freely suspended by its fulcrum knife-edge C from the fixed support D. E is the load knife-edge, and *p* the poise, shown suspended at a point F, such that the turning moments about the

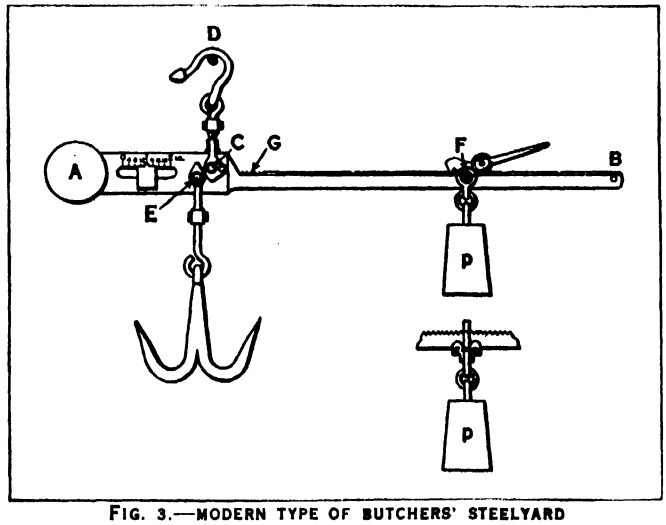

FIG. 3.—MODERN TYPE OF BUTCHERS' STEELYARD
A more primitive method of suspending the poise from the graduated yard is also shown

pivot C due to the weight of the steelyard and its parts, together with those due to the poise and the load (not shown), are of equal magnitude on each side of C. Under these conditions the yard is in equilibrium. Supposing, now, that, with the poise in zero graduation G, and no load except the shackle and its parts depending from E, the instrument be in equilibrium, then it is clear that the centre of gravity of the unloaded steelyard is under the suspension knife-edge C. The weight of the steelyard and its parts, under such conditions, exerts no turning moment about C. If, now, a load L be suspended from E, it will exert a turning moment L×CE, and obviously this can only be balanced by moving the poise *p* away from the centre until, at a point F, the turning moment $p \times CF = L \times CE$. Since CE and *p* are constants the load varies directly as CF. Hence the graduations of the steelyard will be of equal magnitude for equal increments of load. It is desirable that steelyards should be constructed so that the unloaded beam is in balance when the poise is in zero graduation.

The Roman steelyard is an Italian invention, and probably originated about 200 B.C. in Campania, or in Magna Graecia. It was apparently unknown to Aristotle, who, in his "Mechanics," describes the so-called Danish steelyard, which we now know preceded the Roman type in classical antiquity, as also throughout the greater part of Europe and western Asia. The "Danish" steelyard consisted of a beam heavily weighted at one end, and provided at the other with a hook or pivot to which the load could be suspended. A loop of cord generally constituted the fulcrum, the graduated beam being moved through the loop until the load was balanced. The graduations were not equal, but formed a harmonic series. The Shetland *bismar*, the Indian *dhari*, and other instruments found throughout the East, conform to this type. The device was probably a Wiro invention, and was carried by those invaders into western and southern Europe, just as by the Aryans proper it was taken into India.

The modern "Roman" steelyard, still largely used by butchers, is a reliable and accurate instrument. The best makes are provided with devices to prevent undue wear of the graduation notches, and the yard proper, or blade, is made of a non-corrosive steel. The notches are cut by a specially-constructed dividing engine to a degree of accuracy quite unattainable by other means.

Compound Lever Platform Machine.—Practically all heavy loads are to-day weighed on some form of platform machine. Before John Wyatt's brilliant invention of the compound lever, about the year 1744, it was necessary to use immensely heavy and inconvenient steelyards for the weighing of loaded carts, and the operation, even in the case of a small two-wheeled hay cart, was a very laborious one. Wyatt was a master carpenter or

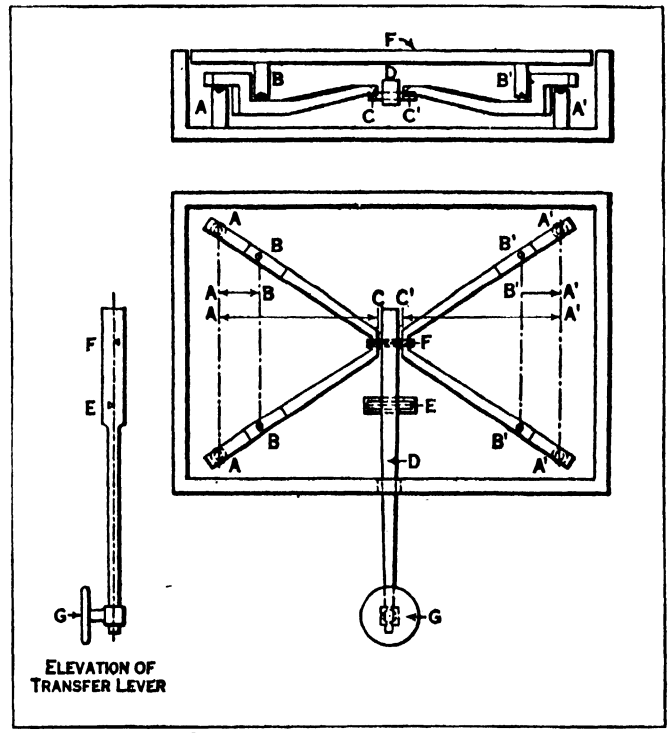

FIG. 4.—WYATT'S WEIGHBRIDGE
This first compound lever platform machine (about 1744) was the brilliant invention of John Wyatt of Birmingham

mechanic. Apparently most of his weighbridges were built when he was in the employ of the great Matthew Boulton. He died in 1766. Fig. 4 is a drawing, necessarily somewhat diagrammatic and lacking in detail, which probably represents correctly the original "bob-up" form of Wyatt's mechanism. It has been constructed from early descriptions and illustrations. (*See* the 3rd edition of the *Ency. Brit.* [1797], under STEELYARD; *John Wyatt, Master Carpenter and Inventor* [1885, published anonymously, but compiled by the late Henry Pooley, of Liverpool], and the Wyatt mss. in the Birmingham reference library.)

The two triangular levers are pivoted at A and A′, and receive the load transmitted by the stool legs of the platform F on pivots B and B′. The arms AB and A′B′ are equal, as are also the arms AC and A′C′. The pivots C and C′ transmit the load to the first order transfer lever D at the same distance FE from its fulcrum E. G is a table for weights to counterbalance the load. Such a combination of levers—crude as it is in construction, being devoid of links and originally having conical points instead of knife-edges—ensures the transmission to the counterpoising lever or steelyard of the same load effect by the same load, irrespective of its position on the platform. Before the close of the 18th century English builders were making machines of which the transfer levers pulled down on the ends of first order steelyards, very much in the modern manner. Whether the Fairbanks brothers of Vermont, U.S.A., were the first to make small platform machines in which no separate transfer lever was used, but in which the upper triangular lever was provided with an extension arm connected to a steelyard, is difficult to ascertain at the present time; but their platform machines, dating from the year 1831, undoubtedly marked an advance in construction and convenience of operation, and had a far-reaching effect on the development of platform machines throughout the world.

Henry Pooley and Son were the first in Great Britain to build such machines for general use on railways. A modern compound lever platform machine for light loads consists of two triangular bottom levers, link-suspended from the framework, and connected together by a central link, the upper lever having an

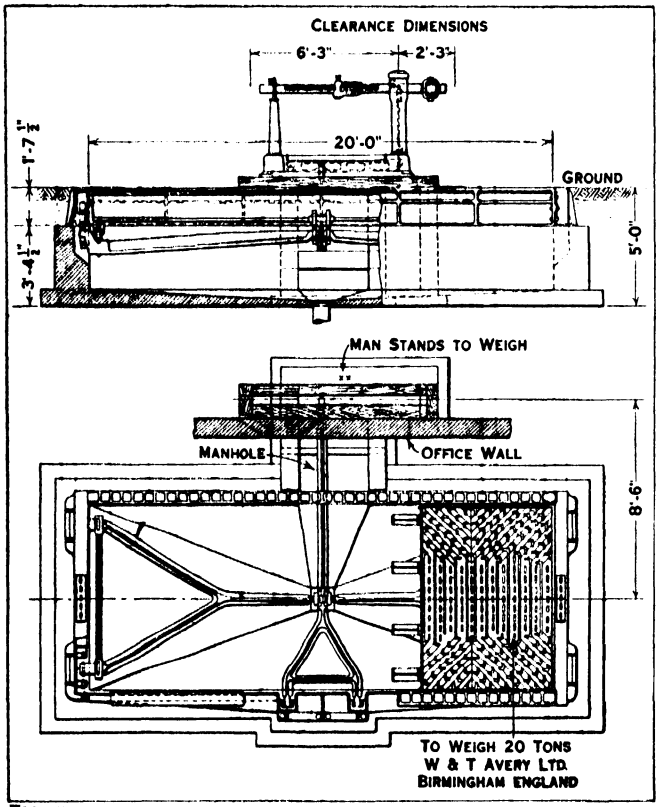

FIG. 5.—PLAN AND ELEVATION OF A MODERN WEIGHBRIDGE CONNECTED TO A "NO-LOOSE-WEIGHT" STEELYARD

These bridges are sometimes connected to automatic dials, the load capacity of which can be multiplied several times by the use of counterpoise weights

extension arm at the end of which is a knife-edge connected by a rod to the counter-balancing and indicating device—a steelyard or automatic dial. If a steelyard is employed, it is designed to be operated without the use of any loose weights, a balance being obtained by means of one large and one small sliding poise. Fig. 5 shows the construction of a modern weighbridge, characterized by having, among other new features, "oil baths," or rather, grease receptacles, fitted round the bottom-lever pivots. American practice differs in many respects from British, as, for instance, in a general preference for fixed levers—that is, triangular or "bottom" levers having their fulcra resting on fixed stools or brackets, whereas the leading British makers prefer to suspend their levers, especially in the case of high-capacity bridges, from links depending from brackets secured to the massive "box-beds" constructed of cast-iron or steel girders which are a distinguishing feature of British practice.

On the Continent of Europe railway track scales are generally equipped with means for putting the portion of the track constituting the platform into relief—that is completely disconnecting it from the weighing mechanism—while the engine or other vehicle is taking up a position thereon. In Britain and the United States track weighbridges, at the present time, are seldom fitted with relieving apparatus, but are made sufficiently strong to resist the shocks due to rolling loads moving at a reasonable speed. A very large amount of loaded rolling stock is weighed while moving at speeds varying from 1 to 3 m. per hour. Platforms supported so as to be free to swing with a restricted movement in all directions are in general use. While in Great Britain and in Europe triangular bottom levers are most frequently employed, in America four transverse "straight" levers, connecting directly with two longitudinal extension levers, constitute customary practice, especially for bridges intended to weigh motor road traffic. The extension levers are, in turn, linked directly to the steelyard, or to the intermediate lever of a self-indicating mechanism.

The steelyards are often equipped with ticket-printing devices, the types being brought into position by a mechanical connection between the type-carrying bars or wheels and the poises by the movement of which a balance of the load is effected.

The accuracy and reliability of high-class modern weighbridges are rather remarkable. A bridge loaded with from 50 to 100 tons will indicate the addition of from 4 to 7 lb. when properly adjusted. In fact, its order of sensitivity is not very different from that of a chemical balance in customary laboratory use.

Plate Pivot Machines.—Of recent years there has been developed, in the United States, a type of weighbridge in which knife-edges are replaced by thin plates or laminae used in compression. These are all derived from the work of A. H. Emery, who, in the year 1875, successfully applied this type of pivot to the construction of a remarkably fine testing machine. There is no doubt that a few admirably reliable and sensitive weighbridges have been constructed with plate-fulcra; but their costliness at present prevents their general adoption. It is claimed that weighbridges built on this principle remain in accurate and sensitive adjustment even if subjected to very severe conditions of use. The plate-fulcra and load pivots are made of chrome-vanadium steel, and their cross sectional area is sufficient to provide an ample margin of safety. The amount of flexure to which they are subjected in use is extremely small. The platform is restrained from horizontal movements by the tension of horizontal plates or rods sufficiently flexible to permit the minute vertical movement required for weighing. The lever system is similar to that of knife-edge lever machines. E. and T. Fairbanks and company, of St. Johnsbury, Vermont, U.S.A., constructed the first "plate-fulcrum" railway track scale in 1915.

Self-indicating Weighing Machines.—The most important developments in the science of weighing instruments in recent years have, unquestionably, been associated with the evolution of the modern visible weigher, or self-indicating machine. All such weighing machines—except one class of automatic or semi-automatic weight-depositing instruments, not yet fully developed—depend on a variable resistant against which the load, or a fractional portion thereof, automatically balances itself when deposited on the scale.

The first self-indicating scales appear to have been invented by Leonardo da Vinci (1452–1519). They are described and drawn in one of his note-books preserved at Paris. (The mss. are in the Bibliothèque de l'Institut. See *Les Manuscrits de Léonard de Vinci, publiés en fac-simile*, etc., par C. Ravaisson Mollien. [6 vols., 1881–91]. *See* also *The Mechanical Inventions of Leonardo da Vinci*, by Dr. Hart [1923].) His description appears to make it certain that he had actually constructed one of these instruments. A semi-circular dial, suitably weighted, is suspended, at

the middle of its diameter, on a pivot from which also hangs a plumb-line, situated so as to serve as an indicator. A scale-pan hangs from one end of the diameter. The design has a remarkable characteristic not shared by many modern instruments, viz., that the accuracy of the indications is not affected by any divergence from horizontality of the surface on which the instrument is placed.

A pendulum or bent-lever resistant does not give equal chart divisions on a circular or segmental chart unless a cam or other equivalent device is used in the application of the load to the resistant, so as to counteract what has been called "the circular error" of the pendulum.

As the pendulous mass is raised by the fall of the load, its resistance increases as the sine of the angle of displacement from the vertical. At the same time, unless the load has been applied by a strap passing round a circular arc concentric with the centre of rotation, the effective length of the arm to which the load is applied will vary. Supposing, in the most simple case, that when the instrument is unloaded the load arm is horizontal and the centre of gravity of the pendulous mass vertically beneath its pivot, then the application of a load will deflect the system until a position of equilibrium is attained. During this movement the effective load arm will become shorter in the ratio of the cosine of the angle of deflection, and the resistant arm will increase from zero in the ratio of the sine of the angle. Hence, the load in all balanced positions will vary as the tangent of the angle of deflection, and a pointer attached to the pendulum will not indicate equal chart graduations for equal load increments. Generally, if the load arm makes an angle ϕ with the horizontal, and the pendulum an angle θ with the vertical, the applied load being L, the following relationship will hold:

$$L \propto \frac{\sin\theta}{\cos\phi}.$$

Obviously, with a small angle of deflection the graduations will be approximately equal to each other, for the arc traversed will be nearly proportional to the trigonometrical function of its angle. Weighing machines have been constructed using such small angles of rotation in order to get virtual equality of sub-divisions, as is

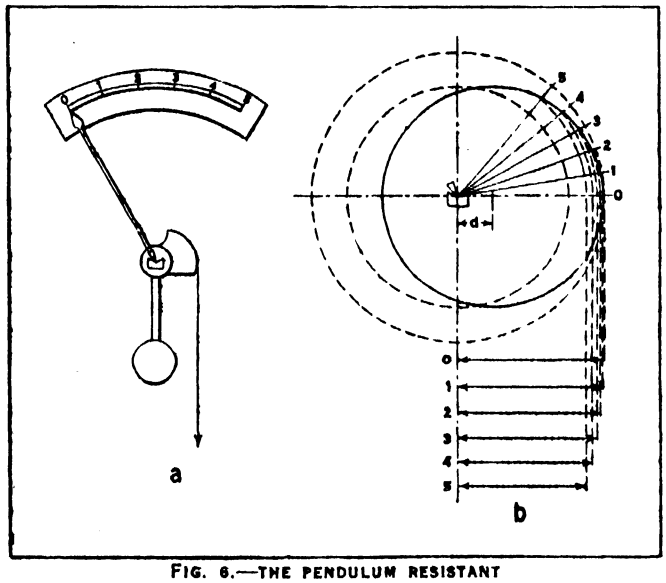

FIG. 6.—THE PENDULUM RESISTANT

(a) Diagram of the mechanism of the Fan Scale used for weighing small quantities in retail shops; (b) Diagram showing how the arm-lengths of the cam vary with the angle through which the pendulum moves

required by the regulations of the various national weights and measures authorities. Where a machine is permanently and securely positioned, and extreme sensitivity is not required, little exception can be taken to this method of construction, which has the great advantage of extreme simplicity and robustness of design.

The sensitivity of a pendulum resistant is, however, within limits imposed by technical considerations, a function of the amplitude of the angle of rotation; and furthermore, the larger the angle the less the derangement that will result from such minute differences of level as may supervene after installation. Hence has arisen a multitude of designs for utilizing a considerable angle of rotation, as 55° for instance, while still obtaining equality of sub-divisions. Various parallel-motion and tangent-bar devices have been constructed, but the most generally em-

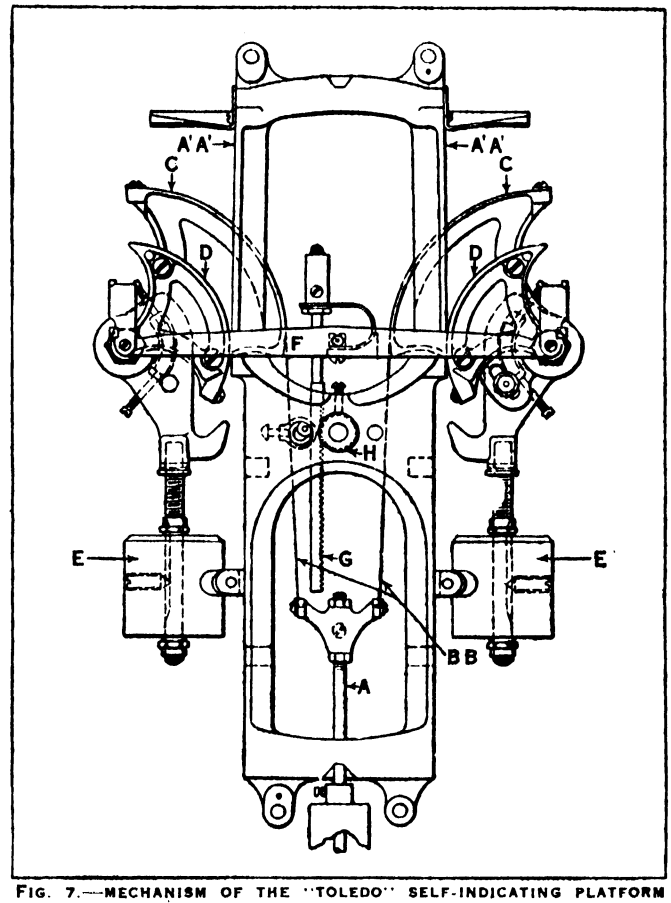

FIG. 7.—MECHANISM OF THE "TOLEDO" SELF-INDICATING PLATFORM MACHINE

(A) Connecting rod attached to weighing levers. Yoke connected by steel straps (BB) to the cams (CC), which are attached to segments (DD) and to pendulums (EE). Segments are suspended from the frame by straps (A'A'). The bar (F) sensitively pivoted to the centres of the circular segments (DD) is raised together with the elastically supported rack (G) which rotates the pinion (H)

ployed method makes use of a cam formed by eccentrically displacing a circular arc in respect of the axis of rotation. To the periphery of this cam the load is applied by means of a flexible metallic strap. (*See* fig. 6, *a* and *b*.) A close approximation to absolute equality of sub-divisions is possible if the best geometrical configuration is adopted. Fig. 6 *a* is a diagram of the mechanism of the well known fan type of self-indicating counter machine. The combined counterbalancing and indicating unit is pivoted on a knife-edge housed in V-shaped bearings. Fig. 6 *b* is a diagram designed to show that the rate of change of the products of the "circular cam" arm-lengths and their respective loads closely approximates to the rate of change of the pendulum moment-arms, which latter, as has been stated above, conform to a sine law. The two rates of change are made to counteract each other in just the measure necessary to permit of the use of equally divided charts. The dimension *d* indicates the linear displacement of the cam circle from the centre of oscillation.

The well known cylindrical computing scale embodies a resistant of this type, the cylinder itself being carried on anti-friction wheels, and rotated by a pinion engaging with a vertically moving rack connected pivotally with the weighing lever. Some types of dial mechanism employ a resistant consisting of two pendulums rotating in opposite senses, thus eliminating the effects of out-of-level disturbances. In a well known American

type of mechanism, knife-edges are dispensed with, the cams, with their attached pendulums, rolling on vertical straps anchored to the framework, and being rotated by other straps attached to a yoke to which the pull transmitted from the weighing levers is centrally applied. (*See* fig. 7.)

A more modern type of resistant, the most highly-developed form of which is illustrated in fig. 8, depends for its effect on the varying leverage of a cam to the periphery of which a weight is suspended. No pendulum is employed. In a commercial instrument a combination of cams is required to obtain equality of sub-divisions on the chart. As the load is increased the strap-suspended cams rotate in opposite senses, and the pivoted weighted levers depending from the contoured faces of other cams rigidly attached to those just mentioned act with a gradually increasing mechanical advantage, thus opposing a proportionally greater resistance to the growing load. Such a device has several technical advantages, one being the absence of the considerable inertia effects generally experienced when pendulous masses are given a comparatively high angular velocity. This effect of inertia has to be provided for.

Dash-pots.—When a load is automatically balanced against a simple variable resistant, only half the energy due to the fall of the load to a position of equilibrium is utilized in raising the pendulous mass, or in extending the spring. The remaining energy, if violent oscillations and shocks are to be avoided, must be absorbed by some form of dash-pot. The devices generally used are cylindrical vessels containing oil, in which pistons pivotally connected with the weighing levers by suitable linkage are adapted to reciprocate. Ports, in the piston, or in a tubular part connecting the upper and lower ends of the oil-containing chamber, enable adjustments to be made to compensate for changes in the viscosity of the oil due to variations of temperature.

Anti-friction Devices.—In those self-indicating machines in which a pointer has to be rotated round a circular dial, or in which a moving dial is used, the weight of the revolving chart is supported on "frictionless" bearings—either miniature ball-bearings, anti-friction wheels, or a crossed-strap suspension device. The first of these is, in many cases, the most commercially convenient, but does not permit the attainment of the same degree of sensitivity that is possible with really well-designed anti-friction wheels.

The *Crossed-strap Device,* a recent "Avery" invention, constitutes the most frictionless method yet discovered of supporting and rotating a large indicating unit. No rack and pinion is necessary. A rotational angle of about 300° is possible. The weight of the spindle carrying the rotating chart is entirely supported by two pairs of thin steel bands. These pairs are secured to, and wrapped in opposed senses about, a small drum attached to the said spindle. Their upper ends are attached to the opposite ends of an inverted weighted pendulous segment, pivoted on a knife-edge working in V-shaped agate bearings. This segment constitutes the variable resistant, and carries a cam or displaced circular arc so disposed eccentrically to the fulcrum as to give equal chart sub-divisions for equal fractions of the total load. The load-effect or "pull" is transmitted from the main weighing lever to this cam by means of a long flexible steel strap. As the segment rotates on its knife-edge it unwinds one pair of straps and winds up the other pair at exactly the same rate, thus rotating the drum mounted on the floating chart-carrying spindle, while maintaining it in exactly the same position.

Other resistants beside the bent-lever or pendulum have been and are used in weighing mechanisms. Of these the chief is the *spring*. The most commonly used form is the spiral spring. For some purposes its employment is quite legitimate; nevertheless, the chief constructors of self-indicating weighers throughout the world have, with few exceptions, abandoned it as a resistant in entirely automatic weighing mechanisms. It has three outstanding defects, two of which are due to its susceptibility to changes of external temperature. The substance of all steel springs expands or contracts in length with variations of temperature, and this generally affects the zero indication of the balance. It can be shown that, in the case of a properly-proportioned spiral spring in the unloaded state, the change in length of the wire due to temperature change makes practically no difference in the actual length of the spiral; but in a weighing instrument such a condition of no-load never occurs in practice. Temperature also affects the specific elasticity of springs. When a spring is warm it extends more under a given load than when cold. Hence, even if the scale-pan is empty, the greater extension of the spring

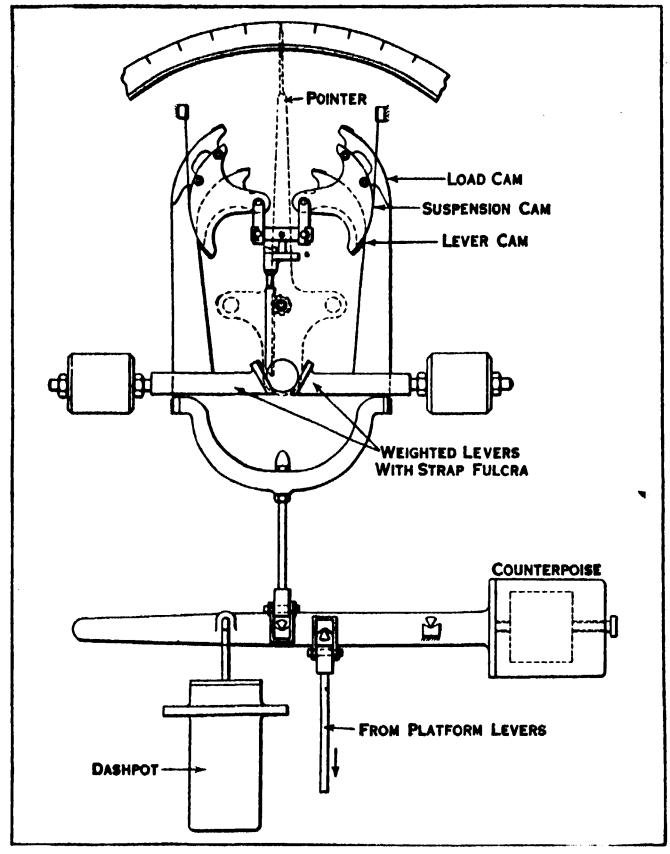

FIG. 8.—AVERY CAM-RESISTANT MECHANISM

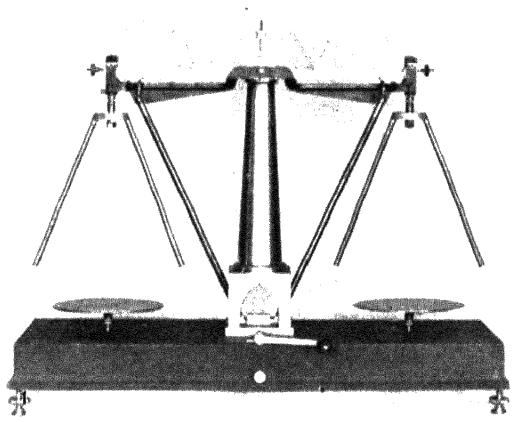
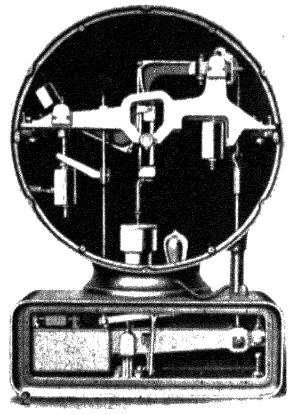
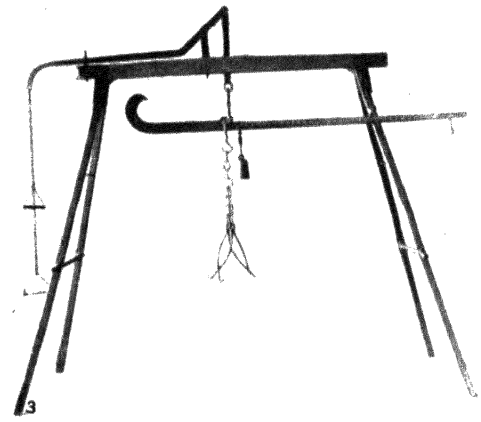


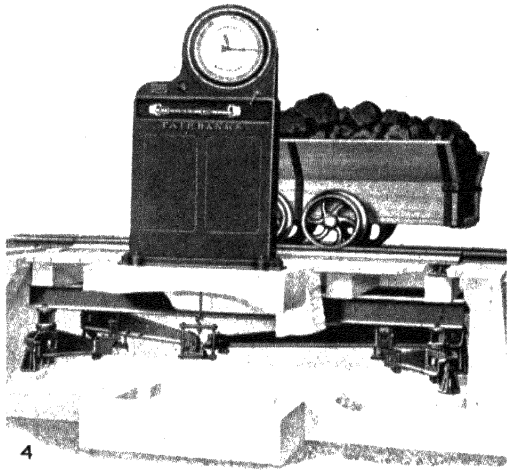
A variable resistant is obtained without the use of pendulums, two sets of suspended triple cam contours so designed as to give to an increasing load a diminishing mechanical advantage in its efforts to raise the weighted levers. These latter are pivoted by steel straps to the periphery of a small circular disc round which they are free to roll. The balanced pointer is operated by rack and pinion



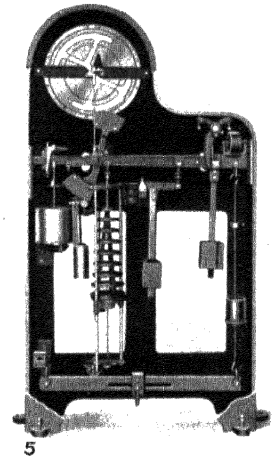
under its initial load due to the weight of necessary parts, displaces the zero indication. To a still greater extent the whole range of indications is affected. In a large measure this defect can be compensated for by means of a thermostatic device made of two dissimilar metals, so disposed that the transmitted load-effect can, by means of a change of leverage, be given a greater or less mechanical advantage before its application to the spring resistant.



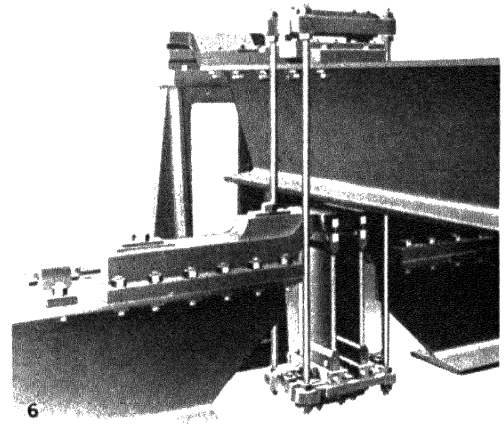
The third source of error is more serious and cannot be completely eliminated, though it is proper to note that, under the actual conditions in which many weighing machines operate, its effects are negligible. If a spring be loaded and the load be very gradually removed, it will often be found that the spring does not return exactly to its original conformation; hence, the zero of an instrument embodying such a spring will not be constant. Other derangements due to this hysteresis of the elastic material of the spring have been noted. In practice, the very gradual and shockless deposition or removal of loads referred to seldom takes place, and vibration—such as that due to neighbouring traffic or machinery—appears generally to eliminate this trouble in the case of well-designed spring-operated machines.

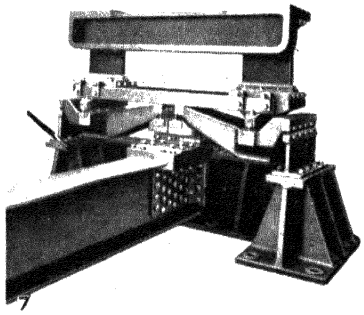


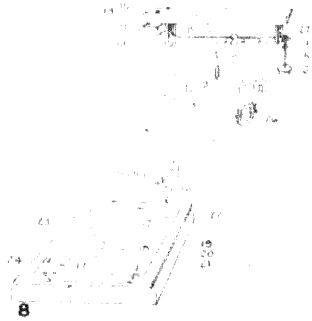
Against these drawbacks the spring has the great advantage of conforming exactly, for all practical purposes, to Hooke's law; that is to say, it gives equal chart sub-divisions. Moreover, it is intrinsically a more sensitive resistant than the pendulum.

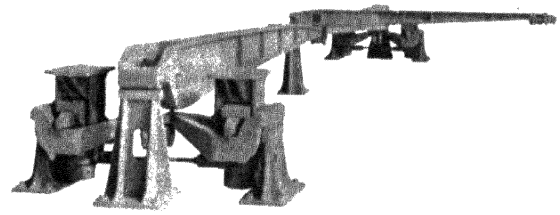


The "hydrostatic resistant" has been made in various forms.









BY COURTESY OF FAIRBANKS, MORSE AND COMPANY

VARIOUS TYPES OF WEIGHING MACHINES

1. Bullion and testing balance, a sensitive beam weighing machine used for precious stones and metal
2. Self-indicating scale with part of back removed to show dial mechanism by means of which weights are indicated on a circular disc for convenience in reading
3. Weighmaster beam, or Roman steelyard, used where absolute accuracy is not required, and valuable for its simplicity and ruggedness
4. Railway track scale used in weighing loaded rolling stock in motion.
5. Platform scale without the compensating cam sometimes used for obtaining equality of sub-divisions on dial
6. Plate fulcrum track scale showing end and transverse lever connections
7. Plate fulcrum track scale showing movable end section
8. Phantom view of compound lever platform machine, showing separate parts: 1, beam; 2, poise; 3, bush poise; 4, counterpoise loop; 5, counterpoise stem; 6, counterpoise cup; 7, weights; 8, fulcrum loop; 9, fulcrum lever beam hook; 10, balance ball; 11, cap; 12, beam rod; 13, pillar; 14, strap washer; 15, pillar rod nuts; 16, nose iron; 17, long lever; 18, short lever; 19, platform board; 20, platform; 21, frame; 22, corner links; 23, bearing steel; 24, screw and block; 25, check rod; 26, trig loop; 27, cap loop
9. Assembly of modern heavy two-section track scale

It depends on the buoyancy of a float and its resistance to vertical displacement. A mercury resistant embodying the same principle has also been extensively used.

Computing Scales. — Entirely automatic self-indicating counter scales are very generally adapted to indicate, not only the weight of the goods, but the particular value of the said weight corresponding to a large number of different unitary prices. Collinear with each weight graduation is a series of price indications —the respective unitary prices, as, for instance, prices per pound avoirdupois being marked either on the pointer, if the dial be of the stationary type, or on the revolving chart itself.

Automatic Feed Scales.—This name is given to a large class of mechanisms by means of which granular and liquid materials may be automatically weighed off in pre-determined amounts. It is now possible to weigh in this manner practically all materials which can be induced to flow through a port or valve of reasonable dimensions. Thus modifications of the same general type of scale will weigh flour and the most finely ground cement, while others will weigh coal and ores broken up in lumps not exceeding say 2 or 3 in. in diameter. In general terms such a machine—one form of which is illustrated in fig. 9—may be defined as consisting of a hopper I, or box terminating a feeding spout, and equipped at its lower end with a pivoted gate D, or gates, adapted, when opened, to permit a flow of material into a scale-hopper C, placed immediately beneath it. This receptacle depends from one end of an equal-armed balance beam A, the other end of which carries a weight box B. When the scale is empty the weighted end of the beam causes the hopper end to rise, and by contacting with a part pivotally connected by links to the above mentioned gate or gates, forces them to open, thus causing the rapid filling of the

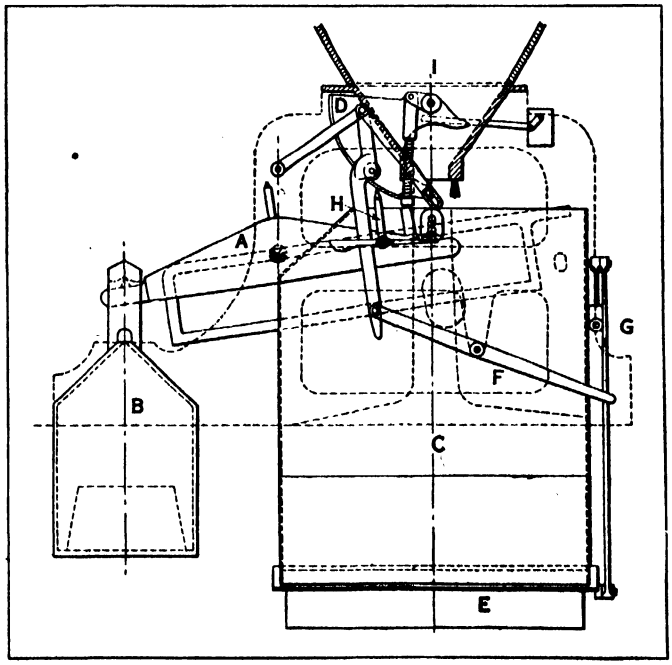


FIG. 9—AUTOMATIC FEED SCALE

A diagram of a grain weigher for automatically weighing wheat and other grains. The material is stored in the hopper I, the gate D being opened by the upward pressure of the empty receptacle C due to the weights in the scale-pan B. When the load in the receptacle balances the weights the receptacle falls, closes the supply gate and opens the discharge-valve E

receptacle with the material being weighed. The bottom of the scale-hopper is closed by a large discharge valve E, to which is connected linkage so designed that, when this door is closed, the linkage forms a locked dead-centre. This device, often called a toggle, is indicated at the right of the receptacle in the illustration. Other and different devices, as detent mechanisms, are sometimes used to keep the bottom door securely fastened until the receptacle has received its proper load.

As a state of equilibrium is approached, the weights no longer hold up the receptacle forcibly against the device which controls the opening of the hopper valve. Consequently, this valve gradually closes, and the final cut-off is arranged to take place just when a balance has been obtained. In some types of this mechanism the balanced beam, in falling away from the gate-opening mechanism, causes contact to be made between a lug or peg attached to the framework, and the linkage or detent-system controlling the discharge valve; or, alternatively, as in fig. 9, a part connected with the feed gate is adapted to "break" the dead centre or toggle mechanism of the discharge valve linkage at the moment when the hopper valve has completely closed. A very small force, properly applied, suffices to effect this release. The moment this takes place the discharge valve E opens, and the weighed material falls into another receptacle, generally connected with a conveyor or elevator.

Such, in brief outline, is the principle on which practically all automatic feed weighers act. Many refinements are, however, necessary in practice, and to the chief of these some reference must be made. At the moment when the receptacle has received its true weight of material, and the beam is moving to the balanced position, there is a considerable weight of material in the act of falling from the closed feed-port to the receptacle. To compensate for this amount, which would otherwise overload the balance, a "compensating lever" is employed. This lever is shown outlined in the illustration as lying parallel to the scale-beam. It is pivoted to the frame, and adapted by means of an adjustable poise, not shown, to press upon the load-receptacle, or some connected part, while the said receptacle is being filled. Consequently, the receptacle tends to fall to the balanced position before it has obtained its full load, thus closing the feed-port. The weight of material in the air at the moment of cut-off exactly compensates for this deficiency. If desired, the accuracy of the weighing can be immediately checked by raising the compensating lever before the hopper has had time to fall sufficiently far to cause discharge to ensue, or by preventing discharge in some other convenient manner. If the adjustments have been properly made, the beam will be found in perfect balance. In order to render the cut-off still more precise, in practically all large weighers a small valve called a "dribble" valve is used in addition to the main valve or valves. The main valves are closed before the weighing is complete, but the dribble port continues open until closed by the release of a detent, or, in some mechanisms—as in the grain weigher illustrated in fig. 9—by the continued movement of the main valve. In some makes of machine, especially those used for weighing grain, the edge of the feed valve port is rimmed with a brush in close proximity to which the closing valve moves very smoothly and without risk of jamming.

The action of the particular type of weigher illustrated may now be followed in a little greater detail. F is a lever connected to the feed valve linkage. When this valve is nearly closed, the little wheel shown on the vertical link is resting on the steel pin H, attached to a pivoted counterbalanced lever. Later, when the loaded receptacle falls to the balanced position, a pin contacts with the counterbalanced lever and throws H over to the right. The valve then closes completely, and the free end of the lever F rises and contacts with the pin G, thus breaking the dead centre and causing the discharge valve E to open.

Small automatic feed weighers, used for filling packets with standard quantities of material, are often operated electrically, as this enables very great accuracy to be attained. In such devices, the instantaneous and energetic shutting of the feed port is accomplished by an electro-magnet, the circuit of which is completed by the fall of the loaded weigh-beam.

Liquid weighers operate on the same general principles as those already described for weighing granular materials.

Conveyor Weighers.—Of recent years various conveyor weighers have been developed, and have filled a useful place in the bulk weighing of materials where no great accuracy is required The principle of operation of one form is here briefly outlined

If a conveyor belt be made to pass over rollers supported by a system of weighing levers, which system is in turn suitably connected to a variable resistant, the resistant will respond to the varying weight of material on the belt. If this weighing device

as regards its load indications, be connected with a device responding to the velocity of linear movement of the conveyor belt in such a manner that the one numerical magnitude is multiplied by the other, it is obvious the product may be evaluated to represent the weight of material passing along the conveyor in a given time. Various methods, some mechanical and some electrical, have been designed to effect this multiplication.

Totalizer.—This weighing machine is of the automatic moving poise type, and is generally used for the automatic weighing and recording of the total of the separate loads contained in a series of receptacles or trucks placed successively on the weighing platform. As each load is imposed an electrically-propelled poise moves out along a steelyard connected to the weighing machine, and effects a balance, at the same time operating a counting device which records and adds on to the total of previous weighments the weight of the newly imposed load. Such mechanisms are capable of very accurate and reliable adjustment. The divergence of the weight indications of the mechanical counters, when such a machine is working under reasonably good conditions, from the true weight of the total loads should not exceed about one-fifth of 1%. About the same standard of accuracy is often attainable with high-class automatic feed weighers.

Weighing as a Means of Counting.—A great extension of this convenient method of counting things of uniform weight has taken place in recent years. Immense numbers of small parts and finished articles are produced by modern methods of machining and fabrication under conditions which ensure that the weight of each piece will be approximately the same. Hence, if a balanced system of linked levers be constructed having two receptacles connected therewith, one large and one small, at points at which the mechanical advantage of a weight deposited in the small pan is a hundred times greater than that of the same weight if deposited in the larger pan, it is obvious that equilibrium can only be obtained by placing 100 such weights in the large pan for every one deposited in the small pan. Hence if, for instance, it is desired to count bolts of uniform pattern in hundreds, one bolt is placed in the small pan and a quantity in the other, the number being rapidly adjusted until a balance is obtained.

A large variety of these instruments are available to-day, adapted to suit particular requirements, but, except in some recently-designed instruments equipped with dials and pointers for counting odd numbers of articles, the principle of operation is the same in all cases.

The future of weighing as a science and industry would seem to lie in the further evolution of self-indicating weighers and automatic feed and packeting machines. In particular, attention will be given to the production of more perfect, convenient, and fraud-proof printing mechanisms. It is already possible to convey to a distant point the weight-indications of a weighing machine, but such devices cannot yet be said to have been made into commercially successful instruments free from liability to error arising from faulty manipulation. As regards self-indicating instruments of large capacity, the most promising line of development would seem to lie in the perfecting of weight-depositing instruments, automatically or semi-automatically controlled, and operated by mechanical or electrical means. While steelyard instruments having mechanically or electrically-propelled poises will, no doubt, attain a high degree of perfection, the automatic deposition of weights on one and the same knife-edge to balance the major portion of a load the fractional portion of which is balanced against a variable resistant, is more completely in accordance with the essential principles of a perfect weighing instrument.

In conclusion, it may be confidently asserted that the rapidity and accuracy of automatic weighing, with its almost complete elimination of the fallible human element, make it certain that a very great extension of this method of weighing may be looked for in the immediate future.

Lawackzeck (Leipzig, 1906), and the Eng. trans. by Walters (Incorporated Society of Inspectors of Weights and Measures, 1909); Airy, "Weighing Machines," *Proc. Inst. Civ. Eng.*, vol. 108; Owen, *A Treatise on Weighing Machines* (London, 1922); Wade, *Scales and Weighing, their Industrial Applications* (New York, 1924); Benton, "Weighing in the Chemical Industries," *Journ. Soc. of Chem. Industry* (1927); Malan and Robinson, *The Weighing and Measuring of Chemical Substances* (1922). The theory of articulated systems, as embodied in counter machines, has been fully discussed by J. A. Bonneau, "Vérificateur des Poids et Mesures" in *Instruments de Pesage à Systèmes Articulés, Première Partie Balances Roberval* (Paris, 1908), and *Inst. de Pesage Théorie Générale* (1913). He discusses also the views of M. M. Lucciardi and Anger. *See* also the publications of the U.S.A. Bureau of Standards, Technologic Papers Nos. 106, 199, 208, etc. (W. A. BN.)

WEIGHT THROWING. The art of throwing a 56 lb. weight to the greatest height or distance. Lifting and hurling weights of different kinds have been popular pastimes from time immemorial. Slinging the "half-hundredweight" for distance approximates most closely, perhaps, to the earliest competitive weight throwing. This was the *roth cleas*, or wheel feat, at the Tailtin Games of Ireland, held as far back as 1829 B.C. It appears that the sport was initiated in Ireland and it is still in Ireland that it enjoys the greatest popularity. In that country the various championship forms of slinging the 56 lb. weight, together with records are as follows:—Without run or follow, J. Mangan, 27ft. 4½in. between legs with follow, J. Mangan, 32ft. 5in.; with unlimited run and follow, T. F. Kiely, 38ft. 11in.; from 9ft. circle, J. J. Flanagan, 39ft. 2½in. In other countries, where the throwing takes place from a 7ft. circle for distance only, the records are as follows:—World and Canada, M. McGrath, U.S.A., 40ft. 6¾in.; Scottish, S. Smith, 33ft. 3in.; English, J. Barrett, 32ft.; U.S.A., P. J. McDonald, 38ft. 9⅞in.; Sweden, E. Stromberg, 35ft. 1in.; World and U.S.A. for height, P. Donovan, 16ft. 11¼in. Slinging the 56 lb. weight was once a common event in Great Britain at all important athletic sports meetings. It has, however, been given championship status upon only three occasions, and has but twice appeared in the Olympic programme, *i.e.*, St. Louis, 1904 (Desmarteau, Canada, 34ft. 4in.), and Antwerp, 1920 (P. J. McDonald, U.S.A., 36ft. 1⅛in.). The American championship for distance was instituted in 1878 and is still continued, the best performance being that of P. McDonald, who, in 1911, threw 38ft. 9⅞in. Prior to 1888, the ordinary, slightly conical half-hundredweight was used and thrown by the ring attached to the top; the ring, however, was awkward to grip and a larger triangular handle was afterwards substituted, while the conical weight was replaced by a spherical head.

To throw for height the athlete places himself beside the high jump uprights and endeavours to heave the half-hundredweight over a cross-bar placed at increasing heights between the standards. The general championship style of throwing for distance from an 8ft. circle, without follow, provides the spectator with a much more lively and entertaining exhibition of strength, speed and skill. The modern 56 lb. weight used for competition comprises a spherical head of moulded lead, or a brass shell filled with lead, having embedded in it a forged steel eye as a means of attaching the handle. The handle is made of round iron, or steel, ½in. in diameter, bent in a triangular form so that no side measures more than 7¼in. The weight is not less than 56 lb., and the length over all not more than 16in. The throwing takes place from a 7ft. circle marked upon the ground, which the thrower must not quit until his throw has been marked.

Method of Throwing.—At the back edge of the rear half of the circle the thrower takes his stance, with feet well separated and the implement resting upon the ground between them. His back is turned towards the direction in which the throw is to be made. He grasps the handle with both hands, the palms turned towards his body, and the cross-piece being against the middle joints of his fingers. He raises the weight from the ground and

swings it round outside his right leg, so that the backs of his hands are turned towards him. As the compensating swing forward starts he gives the weight more speed, swings it once round his head and, as it is coming down at his right side again, he begins to pivot on the left foot in the manner of the hammer thrower (*see* HAMMER THROWING). All the time he is turning he takes care to keep his arms out straight and his body travelling well ahead of the weight, otherwise he will lose control, the weight will drag him round and he will have neither length of swing nor the right position from which to produce a powerful delivery at the end of his one, two or three turns. At the end of the turning movement both feet are on the ground and the athlete's back is facing the direction in which the throw is to be made. Although his feet remain firmly planted, his body takes up and continues the turning movement as he heaves the weight away over his left shoulder. In the finishing position, in which the arms follow up and right through, the body is at full stretch, the legs crossed at the thighs and the left shoulder is pointing in the direction of the flight of the 56 lb. weight. An instant after the release of the weight the thrower's feet are quickly reversed in a compensating movement which enables him to remain inside the circle. A new rule requires that he shall not quit the circle until his throw has been marked and that he shall go out by the rear half of the circle.

One of the few really good 56 lb. weight throwers that England has produced was the late H. A. Leeke, who won the championship in 1911. Both Leeke and his father were Cambridge Blues and English champions in shot putting and also hammer throwing. H. A. Leeke was, however, not heavy enough for the 56 lb. weight event. Matt McGrath, the world's record holder, stood 6 ft. in height and weighed 17 st. 10 lb. (248 lb.) in his prime.

See Silfverstrand and Rasmussen, *Text Book of Athletics* (1926).
(F. A. M. W.)

WEI-HAI-WEI, a naval and coaling station on the north-east coast of the Chinese province of Shantung, leased (together with much of the neighbouring territory and waters and the island of Liu Kung) by Great Britain, through a convention with the Chinese Government in 1898. The previous Chinese port had been captured by Japan in 1895, and occupied by their troops until 1898, when it was given over to Great Britain.

The harbour is formed by the island (Liu Kung) which runs east and west across the mouth of a small bay, leaving an entrance at each end. The best anchorage is under the lee of the island. The native city is walled and has a population of about 2,000. The chief port and seat of Government is Port Edward. The leased area comprises, besides the harbour and island, a belt of mainland 10 English miles wide, skirting the whole length of the bay. The coast-line of the bay is some 10 m. and the total area of the leased district is 285 sq.m.; its population (1921) was 154,416, including 600 on the island of Liu Kung. Within this area Britain has exclusive jurisdiction, her military rights, however, extending to 121° 40′ E.

The leased territory has many fertile valleys among the finger-like projections of the Shantung peninsula. The mild climate makes it an important summer resort. Cereals, vegetables and fruits are grown, and some silk is produced. The people are fishers and farmers. The region contains a few metals, but not of workable value. The imports include bean-cake, candles, cigarettes, coal, raw cotton and yarn, ground-nuts, kerosene, maize, paper, rice, sugar and timber, and the exports are mainly raw cotton and yarn, fish, ground-nuts (kernels and oil), eggs, sugar and salt. The port is duty free. The naval base is used for aircraft. (X.)

History.—The territory of Wei-hai-wei was leased to Great Britain under a convention of July 1, 1898, "for so long a period as Port Arthur shall remain in the occupation of Russia." Since Jan. 1895, prior to which it had been one of China's naval stations, Wei-hai-wei had been held by Japan pending the payment of the indemnity which she had imposed on China after defeating her in war. The Japanese were still in occupation when the lease of the territory to Great Britain was arranged, the idea of the lease having originated with the Chinese, who had just agreed to Germany's possession of Kiaochow. Lord Salisbury at first rejected the Chinese suggestion but, on reconsideration, instructed Sir Claude MacDonald to obtain the lease in order to restore the local balance of power. Wei-hai-wei has been used as a sanatorium for the British squadron on the China station, and under British rule has developed considerably. On Feb. 1, 1922, however, at the Washington Conference, Mr. Balfour announced that the British Government was willing to surrender the lease under conditions similar to those agreed upon regarding the leased area of Kiao-chow. Negotiations ensued and a provisional agreement was reached on May 31, 1923. In 1924, the Peking Government was overthrown and the agreement had to be postponed. (E. M. G.)

WEILBURG, a town in Hesse-Nassau, on the Lahn. Pop. (1925) 3,603. Weilburg was in the 11th century the property of the bishops of Worms, from whom it passed to the house of Nassau. The old town, built on and around a hill almost encircled by the river, contains a 16th century castle, formerly the residence of the dukes of Nassau-Weilburg and later of the grand-dukes of Luxemburg. In the neighbourhood are the ruins of the castles of Merenberg and Freienfels.

WEIMAR, a city of Germany, chief town of the new republic of Thuringia. Pop. (1925) 46,003. It existed in the 9th century. Till 1140 it belonged to the counts of Orlamünde; it then fell to Albert the Bear. In 1247 Otto III. founded a separate Weimar line of counts. In 1345 it became a fief of the landgraves of Thuringia, to whom it escheated in 1385. At the partition of Saxony in 1485 Weimar, with Thuringia, fell to the elder, Ernestine, branch of the Saxon house of Wettin, and was the continuous residence of the senior branch of the dukes of this line since 1572. Under Charles Augustus (1775–1828) and his successors, Weimar became a centre of Liberalism as well as of German art. It was at Weimar, in July 1919, that the constitution of the new German Republic was adopted by the National Assembly.

Weimar still retains much of its mediaeval character owing to the narrow winding streets of the older part of the town, the market-place surrounded by houses with high-pitched gables and roofs and the fragments of the walls, which still survive. Of the churches the *Stadtkirche* is a Gothic building dating from about 1400, but much altered in detail under "classical" influences. The altar-piece is a triptych, the centre-piece representing the Crucifixion; beside the cross Luther is represented, with the open Bible in his hand, while the blood from the pierced side of the Saviour pours on to his head. The other church, the *Jakobs-* or *Hofkirche* (court church) is also ancient. The most important building in Weimar is the former palace, erected (1789–1803) under the superintendence of Goethe, on the site of one burned down in 1774. A remnant of the old palace, with a tower, survives. The interior is very fine, and in one of the wings is a series of rooms dedicated to the poets Goethe, Schiller, Herder and Wieland. Of more interest, however, is the house in which Goethe himself lived from 1782 to 1832. It is a complete example of a German nobleman's house at the beginning of the 19th century. Of more pathetic interest is the *Schillerhaus,* in the *Schillerstrasse,* containing the humble rooms in which Schiller lived and died. The theatre, built under Goethe's superintendence in 1825, memorable in the history of art not only for its associations with the golden age of German drama, but as having witnessed the first performances of many of Wagner's operas, was pulled down and replaced by a new building in 1907. The most beautiful monument of Goethe's genius in the town is, however, the park. Just outside the borders of the park, beyond the Ilm, is the "garden house," a simple wooden cottage with a high-pitched roof in which Goethe used to pass the greater part of the summer. Finally, in the cemetery is the grand ducal family vault, in which Goethe and Schiller also lie, side by side.

Among the other prominent buildings in Weimar are the *Grünes Schloss* (18th century), containing a library and a valuable collection of portraits, etc.; the old ducal dower-house (*Wittumspalais*); and the museum. In 1896 the Goethe-Schiller Archiv, on the wooded height above the Ilm, containing mss. by Goethe, Schiller, Herder, Wieland, Immermann, Fritz Reuter, Mörike, Otto Ludwig and others, was opened. Weimar possesses also archaeological, ethnographical and natural science collections. About 2 m. S. from the town is the château of Belvedere, with the open-air

theatre, of interest because of its use in Goethe's day.

See Kuhn, *Weimar in Wort und Bild* (Jena, 1905, etc.); Francke, *Weimar und Umgebungen* (Weimar, 1900, etc.).

WEINER, LEO (1885–), Hungarian musical composer, was born in Budapest April 16, 1885, and studied in his native city, becoming a professor at the School of Music there in 1907. His works include orchestral works: *Serenade* (1906, awarded the Budapest Lipótvárosi Kaszinó Prize), *Carnival, Scherzo* and accompanying music to a play by Michel Vörösmartz entitled *Csongor és Tünde;* chamber music: two string quartets (the second of which gained the Coolidge Prize in America, 1922), two sonatas for violin and pianoforte, and a ballad for clarinet and pianoforte (also for orchestra). Weiner's style is classical and he ignores both the romantics and the ultra-modern school.

WEINHEIM, a town of Germany, in the republic of Baden, pleasantly situated on the Bergstrasse at the foot of the Odenwald, 11 m. N. of Heidelberg by the railway to Frankfort-on-Main. Pop. (1925) 15,793. It is still in part surrounded by the ruins of its ancient walls. The Gothic town hall, the ruins of the castle of Windeck and the modern castle of the counts of Berckheim, the house of the Teutonic Order, and three churches are the principal buildings. The town has various manufactures, notably leather, machinery and soap, and cultivates fruit and wine. It is a favourite climatic health resort and a great tourist centre for excursions in the Odenwald range. Weinheim is mentioned in chronicles as early as the 8th century, when it was a fief of the abbey of Lorsch, and it was fortified in the 14th century. In the Thirty Years' War it was several times taken and plundered, and its fortifications dismantled.

See Ackermann, *Führer durch Weinheim und Umgebung* (Weinheim, 1895); and Zinkgräf, *Bilder aus der Geschichte der Stadt Weinheim* (Weinheim, 1904).

WEINSBERG, a small town of Germany, in the republic of Württemberg, situated on the Sulm, 5 m. E. from Heilbronn by the railway to Crailsheim. Pop. (1925) 3,658. Conrad III. defeated Welf VI. of Bavaria near Weinsberg in Dec. 1140, and took the town, which later became a free imperial city. In 1331 it joined the league of the Swabian cities, but was taken by the nobles in 1440 and sold to the elector palatine, thus losing its liberties. It was burnt in 1525 as a punishment for the atrocities committed by the revolted peasants. It has an ancient Romanesque church and a school of viticulture, which is the chief occupation of the inhabitants. On the Schlossberg above the town lie the ruins of the castle of Weibertreu. The famous legend of Weibertreu is connected with the siege of 1140, when Conrad III. is said to have allowed the women to leave the town with whatever they could carry, whereupon they came out with their husbands on their backs.

WEIR, ROBERT WALTER (1803–1889), American portrait and historical painter, was born at New Rochelle, New York, on the 18th of June 1803. He was a pupil of Jarvis, was elected to the National Academy of Design in 1829, and was teacher of drawing at the United States Military Academy at West Point in 1834–1846, and professor of drawing there in 1846–1876. He died in New York City on the 1st of May 1889. Among his better-known works are: "The Embarkation of the Pilgrims" (in the rotunda of the United States Capitol at Washington, D.C.); "Landing of Hendrik Hudson"; "Evening of the Crucifixion"; "Columbus before the Council of Salamanca"; "Our Lord on the Mount of Olives"; "Virgil and Dante crossing the Styx," and several portraits, now at West Point, and "Peace and War" in the Chapel there.

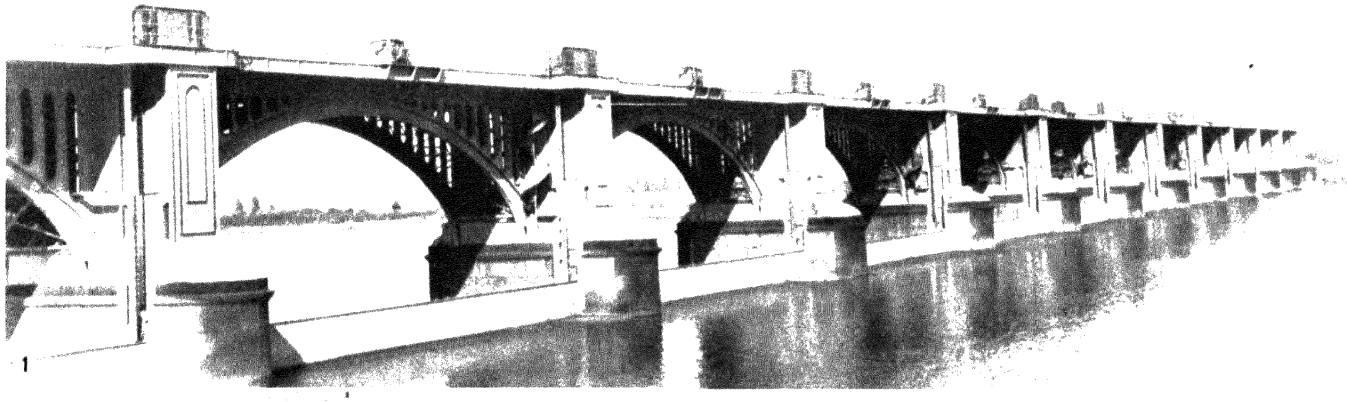
His son, JOHN FERGUSON WEIR (b. 1841), painter and sculptor, became a Member of the National Academy of Design in 1866, and was made director of the Yale University Art School in 1868. Another son, JULIAN ALDEN WEIR (b. 1852), studied under his father, and under J. L. Gérôme, and became a distinguished portrait, figure and landscape painter.

WEIR, WILLIAM DOUGLAS WEIR 1st BARON (1877–), British politician and business man, was born May 12, 1877, the son of James Weir of Over Courance, Dumfriesshire. He was successively Scottish director of munitions (1915), member of the Air Board (1917), Air minister (1918), and chairman of the advisory committee on civil aviation. His firm of G. & J. Weir, Ltd., Glasgow, constructed the "Weir" steel houses, about which there was controversy in 1925. He became a knight (1917) and a peer, and a privy councillor 1918.

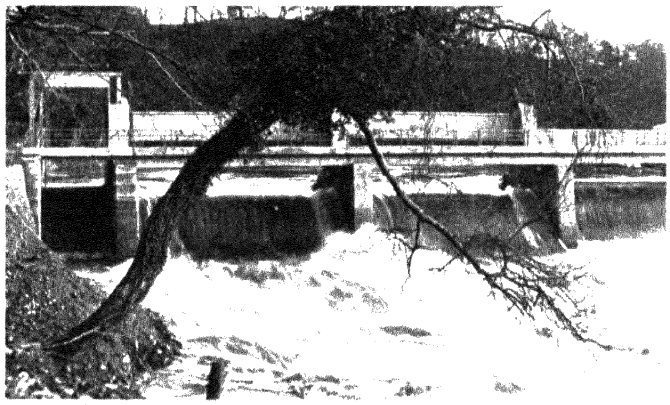
WEIR, a barrier placed across a river or canal for raising or diverting or regulating the water for navigation, irrigation, power and other purposes. A weir, as distinguished from a dam employed for purposes of water storage, connotes the discharge of water over its crest or through wide openings made for the purpose. River weirs are not infrequently termed dams, and the French term *barrage* is often applied to weirs provided with sluice openings. In the United States a barrier placed across a river for any purpose is called a dam, the term weir being used to denote the movable wickets or gates forming part of it and employed for regulating the flow and level of the water. (*See* WATER-SUPPLY, IRRIGATION, DAMS and HYDRAULICS.)

Rough weirs, formed of stakes and brushwood, were erected across English rivers in Saxon times for holding up the water and catching fish. Fish traps, with iron-wire meshes and eel-baskets, are still used sometimes at weirs. Weirs exhibit the greatest variety of form and construction in connection with the canalisation of rivers. Navigation becomes impracticable at the shoals in many rivers during periods of low water. In early times boats had to be kept at such places until the discharge of storm-water raised the river sufficiently to carry them over the shallows. An early method of remedying this trouble consisted in building low weirs to increase the depth of water. Openings formed in them could be temporarily closed by stanches usually consisting of planks supported by movable wooden beams. By removing these beams suddenly and thus releasing the stanch an artificial flood was produced which carried any boat waiting above the weir through the opening and over the shoals below. This process was called flashing. It remained in use on some rivers in England and France until well on in the 19th century.

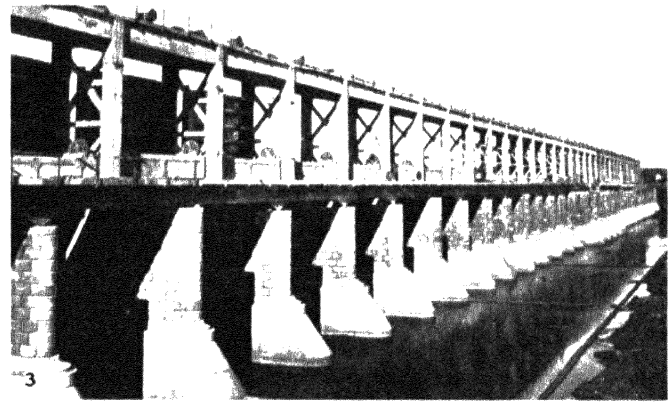
There are four principal classes of weirs, namely: (1) solid or overfall weirs; (2) movable weirs which retain the water above them for navigation or irrigation during the low stage of the river and can be lowered so as to leave the channel quite open in flood-time; (3) draw-door weirs, in which doors or gates closing openings are lifted by means of machinery carried on a permanent overhead structure; and (4) other lifting weirs of various forms operated by overhead gear.



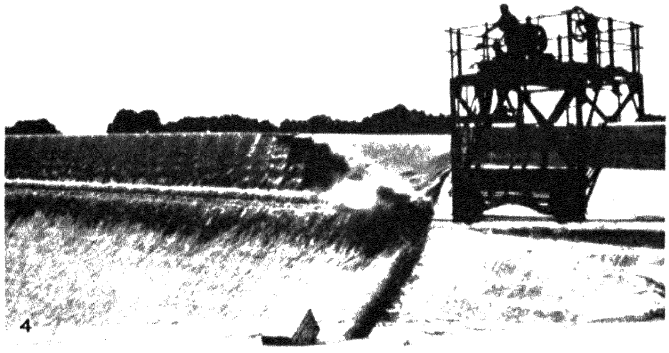
1. SOLID WEIRS



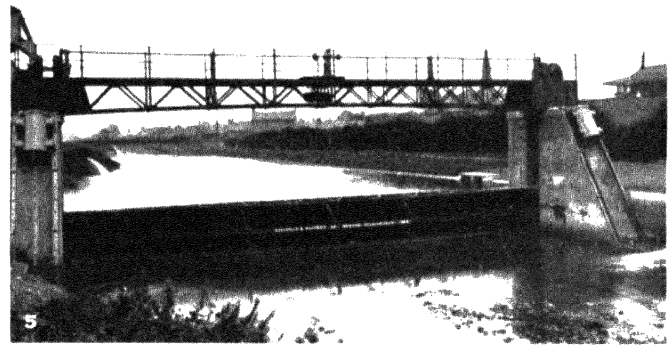
The simplest form of weir on an alluvial or erodible foundation is a dam of earthwork or rubble-stone faced with stone pitching or masonry, or fascine mattresses weighted with stone, or with timber cribs filled with rubble. Many solid weirs were formerly constructed in North America of log-timber or stone-filled cribs. Large modern weirs on alluvial soil are now frequently built of concrete on piled foundations. When solid weirs are founded on rock, concrete or masonry construction is usually employed. It is frequently desirable to maintain a pool of water, by building a small dam below the weir against the down stream face of the weir to act as a water-cushion for the overflow.



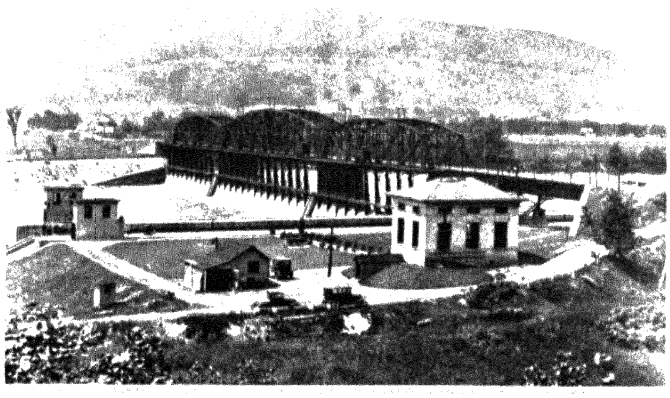
Weirs founded on alluvial deposits are specially liable to undermining, and the consequent washing out of the foundation, and to the scouring action of the water down stream. Undermining is prevented by impeding the percolation of the water under the weir by means of a cut-off, either in the form of a deep curtain-wall of masonry or concrete or of steel interlocked sheet-piling. Scour below the weir can be prevented by constructing a suitable apron of rubble-stone or cribwork of sufficient width. Frequently cut-off walls are formed both under the crest of the weir and under the apron. In many Indian rivers weirs have been built with cut-off walls formed of brick or concrete wells. The weirs across the Damietta and Rosetta branches of the Nile below the Grand Barrage at the head of the delta (1899–1901) have cut-off walls of cement-grouted rubble in a dredged trench.

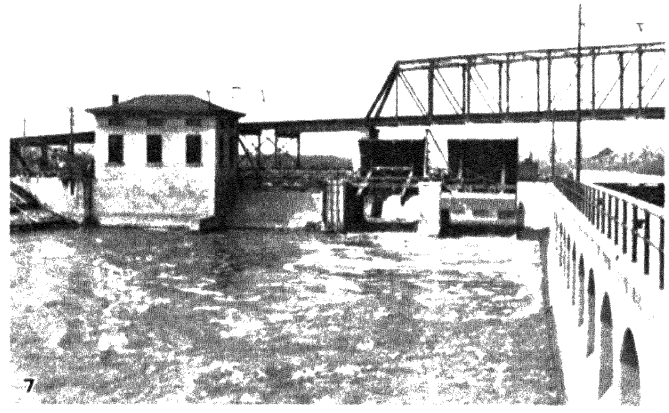


Solid weirs, if properly constructed, possess the advantage of simplicity, strength and durability, and require no attendance.



WEIR





BY COURTESY OF (1, 2) RANSOMES AND RAPIER, LTD., (3, 4, 5) GLENFIELD AND KENNEDY, LTD., (6, 7) CHIEF ENGINEER, NEW YORK STATE BARGE CANALS

1. Stoney Gates at Neuquen Barrage, Argentina, 65′ 7″ span and 13′ 1″ deep. The counterbalance weights are housed in the bridge piers. 2. Stonebyres Weir, River Clyde, Scotland, 38 ft. span and 8 ft. effective depth. The crestgates are automatic. 3. Thirty-six Stoney roller gates, at Vaal River Barrage, South Africa. 4. Hinged steel shutters forming movable crest weir at Mockes Dam, Modder River, South Africa. On release of View shows shutters falling in succession. 5. Stoney roller gate 70 ft. long and 7 ft. deep on River Irvine, Scotland. One man can raise the gate 13 ft. in 2 minutes. 6. Bridge-suspended weir at Rotterdam, New York. This is one of eight similar weirs on the Mohawk River. The bridge also carries a roadway. 7. Taintor gates at Lyons, N.Y. Gate on left is in process of construction. Both gates are seen in raised position.

They, however, block up the river channel to the extent of their height, and consequently raise the flood-level above them. This defect of solid weirs, when the riparian lands are liable to be injured by inundations, can be slightly mitigated by keeping down the crest of the weir a little below the required level, and then raising the water level at the low stage of the river by placing planks, called flash-boards, a few feet high along the top of the weir. The capacity of a solid weir is increased by building it obliquely across the river, *e.g.*, some of the Severn weirs; or curved in plan, with the convex face up-stream.

2. MOVABLE WEIRS

Movable weirs are barriers capable of being lowered so as to present no obstruction to the flow of water in flood time. They are constructed either upon a foundation or sill having its surface approximately level with that of the river bed or on the crest of a solid weir structure raised above the river bed.

Needle Weirs.—A simple form of needle weir was employed in France about the end of the 18th century. Small wooden spars called *aiguilles* (needles), which bore on the bottom against a masonry sill and at the top against wooden beams supported on masonry piers, formed the barrier. This type, however, only provided a series of small openings between the piers. Poirée, a French engineer, devised in 1834 the movable frame weir which bears his name and can be lowered so as to leave the whole width of the river free from obstruction. In its ordinary form the Poirée needle weir consists of a series of iron frames placed across a river, end on to the current, 3 to 4 ft. apart, hinged to a masonry apron on the bed of the river and carrying a foot-way across the top, from which the actual barrier, resting against the frames and cross bars at the top and a sill at the bottom, is put into place or removed for closing or opening the weir. A winch is used to handle the frames.

A needle weir built in 1891–97 across the Big Sandy river at Louisa, Ky., was the first constructed in the United States and is higher than any in Europe.

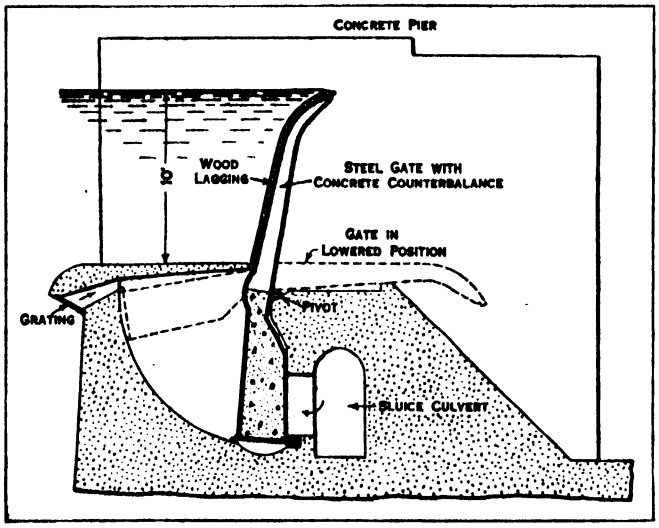
Boulé Gates.—A modification of the Poirée needle weir is the Boulé gate introduced in 1874 in which panels of boards or sheet-iron set in tiers one above another are used instead of needles to form the barrier between the frames. The panels are set and removed by a small derrick crane travelling on top of the footbridge. The system has the advantage of forming a tighter dam which can be more easily although less rapidly manoeuvred than needles. Boulé gates have been used to a considerable extent in France and on the Moskowa and other rivers in Russia.

Curtain Weirs.—The curtain weir, invented by Caméré, was first introduced in 1876–80 at Port Villez on the lower Seine. In it wooden curtains that can be rolled up from the bottom were substituted for the needles in the Poirée weir. The curtains are raised and removed, and the frames lowered by winches travelling over the service bridge. The manoeuvring of the frames and curtains is a troublesome operation and all the curtain weirs subsequently constructed have been designed for suspension from a fixed over-head bridge (*vide infra.*).

Shutter Weirs.—The earliest practical application of falling shutters to overfall weirs was made on the river Orb in France in the latter part of the 18th century. A gate or shutter turning on a horizontal axis at the bottom was supported by a prop when raised against the stream and fell flat on the apron when the prop was drawn aside. The difficulty experienced in raising such a shutter against a head of water was overcome by Thénard about 1837 who placed a second row of shutters (counter-shutters) on the up-stream side of the weir which, rising with the stream, were retained in an upright position by chains and stopped the flow of water while the lower shutters were being raised and propped. Shutters of modified and improved forms, some of them automatic in action, are in use at many irrigation weirs in India and other countries. A modern form of shutter falling automatically is illustrated in Plate, fig. 4.

Chanoine Weirs.—The inconveniences attending the use of counter-shutters of the Thénard type were overcome by Chanoine, another French engineer, who, in 1857, at the Conflans weir on the Seine, employed shutters turning on a horizontal axis a little above their centre of pressure. The axis rests on an iron trestle at the back of each shutter, which is hinged to the apron of the weir and is supported when raised by an iron prop resting against a shoe fastened on the apron. The weir is opened by releasing the props from their shoes, either by a sideways pull of a tripping bar with projecting teeth laid on the apron and worked from the bank, or by pulling the props clear of their shoes by chains. The weir is raised again by pulling up the shutters to a horizontal position by their bottom chains from a special boat or from a foot-bridge on movable frames, together with their trestles and the props which are replaced in their shoes. The discharge at the weir whilst it is raised is usually effected by partially tipping some of the shutters by chains from a foot-bridge. Occasionally the balance is so arranged that the shutters tip automatically when the water level in the upper pool reaches a certain height.

The addition of a foot-bridge facilitates the raising and lowering of these weirs and the regulation of the discharge, but it makes the weir more costly than the ordinary needle weir. Moreover, where large quantities of drift come down with sudden floods, the frames of the bridge are liable to be carried away and therefore boats must be relied on for working the weir as on the upper reaches of the Ohio river. In the United States the type is known as the Chanoine wicket. The Chanoine shutter is adapted for use both on overfalls and in navigable passes.



Bear-trap Weirs.—The earliest example of that form of the shutter weir known as the bear-trap, one of the most commonly used types in North America, was constructed in 1818 on the Lehigh river (Pa.). It consists of two timber—or, in recent types, steel—gates, each hinged on a horizontal axis, inclined towards one another and abutting together at an angle in the centre when the weir is raised. The up-stream leaf or gate serves as the weir and the down-stream one forms its support. Both gates fall flat on the sill floor when the weir is opened. The weir is raised by admitting water beneath the gates through culverts in connection with the upper pool and controlled by valves, and is lowered by letting the water under the gates escape into the lower pool. In its original form the bear-trap was open to several important objections such as the twisting or warping of a wide gate in raising or lowering, the friction between the leaves, and lodgement of driftwood or stones under them. Since about 1896 many improvements in the design of bear-traps have been made and there are numerous examples on North American rivers with leaves over 120 ft., wide, and with lifts up to about 17 ft.

Drum-weirs and Sector Gates.—The drum-weirs invented by Desfontaines and erected on the river Marne between 1857–67 comprise a series of upper and under wrought-iron paddles or blades which can make a quarter of a revolution round a central axis laid along the sill of the weir. By means of valves the pressure of the water due to the head of the upper pool can be applied to either side of the lower and larger paddle, which is contained in a masonry chamber, or drum, below the weir apron, and thus the upper paddle can be raised against a head of water or lowered as required. The disadvantage of the arrangement is the high cost of constructing the deep chambers below the weir sill, and its use is generally restricted to over-fall weirs. Several examples of the type in modified forms and on a large scale have, however, been erected in Germany, one at Charlottenberg having an upper paddle 33 ft. long and 9½ ft. high.

A form of drum-weir invented by an American engineer, H. M. Chittenden, has been used in the United States. An early example was erected about 1895 in a weir on the Osage river near its confluence with the Missouri where a hollow, wooden sector of a cylinder having a radius of 9 ft. rotates on a horizontal axis and is housed when lowered in a drum chamber below the weir sill. The weir is raised by admitting water from the upper pool into a wedge-shaped space left below the sector when it is lowered. Provision is also made for rendering the sector buoyant by forcing air into it so that it can be raised when the head of water in the upper pool is insufficient to lift it.

The sector-gate applied to weirs may be said to be a development of the Chittenden drum-weir. Two large gates, each 100 ft.

long and about 16 ft. high, have been constructed across the Genesee river near Rochester, N.Y. The gates are, when lowered, housed in concrete chambers formed between the abutments below the level of the fixed-weir crest. The steel sector-frame which forms the gate is hinged on its axial line, and the plating fixed to the cylindrical face forms the water barrier when the sector is raised. The gate is operated by admitting water from

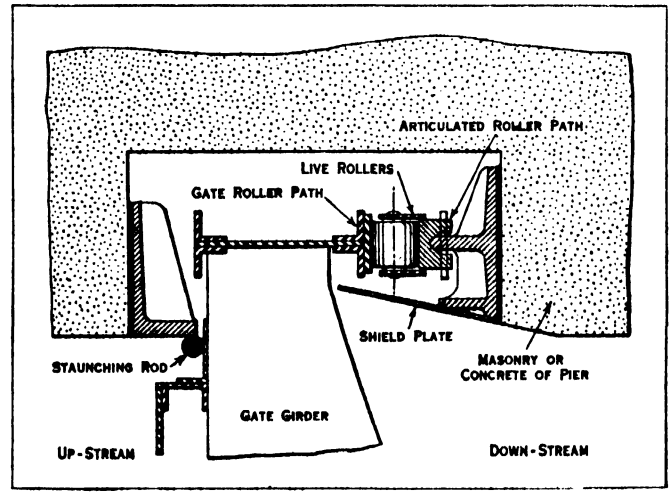
BY COURTESY OF RANSOMES & RAPIERS

FIG. 1.—MODERN DRUM-WEIR MANGAHOO, NEW ZEALAND, WITH GATES 53½ FT. SPAN

the higher pool under the sector by means of culverts and valves. Somewhat similar gates are in use on the river Drac in France; on the Weser at Bremen; on the Chicago drainage canal; in Norway, where one gate is 163 ft. long; and in Perak.

Automatic Crest Gates or Weirs.—Several forms of gates or shutters which operate automatically have been devised, particularly in recent years, for use on the crests of solid weirs to give increased height. The common feature of these devices is the automatic lowering of the gate as soon as the water rises to a certain level. When the water falls below this level, the gate rises again to its normal position as a barrier.

The Stickney crest gate consists of two leaves joined together at about right angles and hinged to a masonry base on a horizontal axis. Under the lower leaf is a quadrant-shaped chamber formed in the concrete or masonry of the weir which is in communication by means of water openings with the up-stream pool. The areas of the leaves are so proportioned that the pressure against the under side of the lower leaf preponderates until the water rises above its normal level when the gate falls. These gates have been made in sections of over 100 ft. in length and for heights of about 8 ft. For long weirs several crest gates, separated by piers, may be used. Several are in use on the New York State barge canal system.



Another form of automatic gate consists of single leaves hinged horizontally at the crest level of the solid weir and balanced by counter-weights carried by pivoted levers or by chains and pulleys on piers raised above the weir at intervals of about 50 ft., the spans between the piers being occupied by the hinged gates. Various ingenious devices at the fulcrum of the lever or in connection with the pulley wheels are employed to vary automatically the balance as the gate rises and falls (Plate, fig. 4).

3. DRAW-DOOR WEIRS

The water discharge at a weir can be regulated and considerably increased in flood time by introducing a series of openings in a solid weir, with sluice gates or panels which slide in grooves at the sides of upright frames or masonry or concrete piers erected at convenient intervals apart. The sluice gates can be raised or lowered as desired from an overbridge. Ordinary draw-doors of moderate size and raised against a small head of water can be readily worked in spite of the friction of the sides of the doors against their supports; but with large draw-doors and a considerable head, the friction of the surfaces in contact offers a serious impediment in raising them. To overcome this difficulty F. G. M. Stoney about 1875 introduced roller sluice gates.

Stoney Gates.—In the Stoney sluice gate two frames, containing a number of free, or live, rollers, are interposed between the fixed framework and the moving face of the gate, so that, instead of a sliding friction, which in very large sluices might amount to over 300 tons, a rolling friction only has to be overcome, which is insignificant in amount. The working is facilitated by counterpoising the gates and roller trains. By these arrangements the friction is so reduced that gates subjected to a water pressure of over 400 tons can be easily moved by hand-operated gearing. Water-tight joints are obtained by means of suspended iron rods or tubes or by rubber strips which are jammed by the water-pressure against the small apertures between the gates and the fixed framework (fig. 2 and Plate, fig. 5).

Stoney gates have been used for openings up to 80 ft. in width and for depths exceeding 35 ft. The first example constructed in the United Kingdom was at Belleek in 1883 in connection with the Lough Erne drainage works. A well-known example is the weir across the Thames at Richmond with three spans of 66 ft. each closed by doors 12 ft. high (1892–94). In order that the doors when raised may not impede the view of the river under the arches, the doors are rotated automatically at the top by

BY COURTESY OF RANSOMES & RAPIERS

FIG. 2.—STONEY GATE SECTIONAL PLAN OF VERTICAL ROLLER PATHS

grooves at the sides of the piers, so as to assume a horizontal position and pass out of sight in the central space between the overhead footways.

4. OTHER LIFTING WEIRS

Bridge-suspended Weirs.—The difficulty of operating the Caméré curtains in conjunction with movable frames hinged at the sill of a solid weir or apron led to the construction, as a part of the Poses weir on the lower Seine (completed in 1885), of a fixed overhead-bridge from which the frames and curtains are suspended. The suspended frames are hinged to the under side of the bridge and rest against a sill at the bottom when the weir is in operation. The rolling curtains are raised when necessary and the hinged-frames lifted to a horizontal position under the bridge by means of travelling winches and chains. This system, which has been employed for several weirs on the Seine, on the Moldau in Bohemia, and on the Danube canal near Vienna, has the merit of raising all the movable parts of the weir out of the water, in flood time, into a position where they are not subjected to the risk of damage, and rendering the working of the weir safe and easy. On the other hand it involves the expense of wide and high river piers and a substantial over-bridge.

A bridge-suspended weir with Caméré curtains at the St. Andrew's rapids on the Red river, Manitoba, was the first of its

kind to be built in America (1908–11). The bridge is of 6 spans of 120 ft. each and also carries a roadway.

The Mohawk river, forming a part of the New York State barge canal system, has been canalized by the construction of a number of dams, 8 of which are of the suspended weir type. At each of these weirs the river is crossed by a steel-truss bridge, usually of three spans, carried upon masonry and concrete piers. The clear spans vary in width from 120 ft. to 240 ft. Some of the bridges carry roadways as well as the weir-operating machinery. The only fixed structure in the river other than the bridge piers is a concrete sill level with the river bed. Against this sill bear vertical steel beams suspended from the over-bridge at intervals of 15 ft. (*see* Plate, fig. 6). Steel doors 30 ft. wide mounted on rollers and arranged in two tiers can be moved up on and down on the up-stream faces of the hanging beams by means of travelling electric winches carried by the bridge. During the navigation season the hanging beams are kept lowered and are only raised partly or entirely in cases of extreme freshets. The discharge of ordinary floods is provided for by raising the roller doors. At the close of the navigation season the hanging beams with their doors are raised to a horizontal position under the bridge floor to permit the free passage of ice.

Taintor Gates.—The Taintor gate is a form of sector gate but it differs from the type described in section 2 p. 489 in being raised, by means of hand-operated gearing and counterweights, in order to open the waterway. Many of these gates have been constructed in recent years, particularly on the New York State barge canal system. (*See* Plate, fig. 7.) Some of the larger gates are 50 ft. wide with a water depth of 20 ft. In common with some other forms of lifting gates they possess the advantage over lowering weirs of all working parts being accessible from above water.

Rolling Dams.—A form of movable weir consisting essentially of a rolling gate was first employed on a tributary of the river Main near Schweinfurt, Bavaria, in 1901. It consists of a steel drum or pipe, usually cylindrical and sometimes with a protruding rib to increase the retaining height, which closes the opening in a fixed weir when required and which, when the weir is to be opened, can be rolled by mechanical means up inclines at the abutments, leaving a clear opening underneath. Several of these weirs have been built in Germany, Bohemia, France, Italy and the United States. They have been made up to 115 ft. in length and with closing heights up to 20 ft.

One of the longest weirs on the Ohio river is a navigable pass, 1,200 ft. long, closed by Chanoine wickets, an overfall weir of Chanoine wickets 700 ft. in length, three bear-traps occupying 325 ft. and a fixed weir of 715 ft. making a total of 2,940 feet.

An example of a long weir with over-bridge is the Lloyd barrage on the Indus at Sukkur in Scinde (1929) which has 66 Stoney gates each of 60 ft. span and 18½ ft. in height. The total length of the weir, including the piers, is 4,620 feet.

WEISMANN, AUGUST (1834–1914), German biologist, was born at Frankfort-on-Main, on Jan. 17, 1834. In 1863 he went to Giessen to study biology under Leuckart, and in 1866 he was appointed extraordinary professor of zoology at Freiburg, becoming ordinary professor a few years later. His earlier work was largely concerned with purely zoological investigations, one of his earliest works dealing with the development of the Diptera. Microscopical work, however, became impossible to him owing to impaired eyesight, and he turned his attention to wider problems of biological inquiry. Between 1868 and 1876 he published a series of papers attacking the question of the variability of organisms; these were published in an English translation under the title *Studies in the Theories of Descent* (1882), Darwin himself contributing a preface in which the importance of the nature and cause of variability in individuals was emphasized. Weismann's name is best known as the author of the germ-plasm theory of heredity, with its accompanying denial of the transmission of acquired characters—a theory which on its publication met with considerable opposition, especially in England, from orthodox Darwinism. His views on the permanence of the germ-plasm and his rejection of the inheritance of acquired characters are not without their theological implications. A series of essays in which this theory is expressed and in which Weismann declared that there must be a reduction division for the chromosome—a prophecy verified a few years later by Platner and others—was collected and published in an English translation (*Essays upon Heredity and Kindred Biological Problems*, vol. i. 1889, vol. ii. 1892). Weismann published many other works devoted to the exposition of his biological views. He died at Freiburg in Baden on Nov. 6, 1914. His latest publications were an estimate of Darwin's work, and *Die Selektionstheorie*.

For an account of his doctrines the reader is referred to the articles on HEREDITY, REGENERATION and REPRODUCTION, and CYTOLOGY. *See* also E. Gaupp, *August Weismann* (1917).

WEISSENBURG: *see* WISSEMBOURG

WEISSENBURG-AM-SAND, a town of Germany, in the Bavarian district of Middle Franconia, situated at the western foot of the Franconian Jura, and 33m. by rail S.W. of Nürnberg by the railway to Munich. Pop. (1925) 7,856. Weissenburg dates from the 8th century, and in the 14th was made a free imperial town. It passed to Bavaria in 1806. It is still surrounded by old walls and towers, and has two Gothic churches and a Gothic town hall. The town has a mineral spring and remains of a Roman castle have been discovered. The old fortalice of Wülzburg (2,060ft.) overlooks the town.

WEISSENFELS, in the Prussian province of Saxony. Pop. (1925) 36,747. Weissenfels is a place of considerable antiquity, and from 1656 till 1746 it was the capital of the small duchy of Saxe-Weissenfels. The body of Gustavus Adolphus was embalmed at Weissenfels after the battle of Lützen. The former palace, called the Augustusburg, built in 1664–1690, lies on an eminence near the town. Weissenfels manufactures cardboard, rubber, boots, machinery, ironware, paper and other goods. In the neighbourhood are large deposits of sandstone and lignite.

WELD (*Reseda luteola*), an herbaceous plant of the mignonette family (Resedaceae) formerly cultivated in France, Germany and Austria. It is the oldest European dyestuff known, and appears to have been used by the Gauls in the time of Julius Caesar. Of all the natural yellow colouring matters, it yields the purest and fastest shades, but owing to the small amount of dye which it contains, and its bulky nature, it has almost disappeared from the market. Weld contains the yellow colouring matter luteolin, $C_{15}H_{10}O_6$, which crystallizes in yellow needles ($+1\frac{1}{2}H_2O$) and melts at 320° C. (*See* ANTHOCYANINS.) (A. G. P.)

WELDING. Not until comparatively recently was the value of welding as a standard method of joining metal pieces fully appreciated. It was during the World War that the various welding processes came into their own because speed of production in every metal-using and metal-fabricating industry became a vital factor. At first welding was limited to small or less important parts. Now (1929) welding is employed for an almost limitless number of applications. The subject of welding may be divided into the five following processes: (1) forge welding; (2) arc welding; (3) gas welding; (4) resistance welding; (5) thermit welding.

Forge Welding.—Until about 1890 this was the only available method of welding and it had been in use to some extent for centuries. After properly shaping the two surfaces to be joined, the parts are heated to welding temperature in a forge or furnace and then hammered, rolled or pressed together, usually with the aid of some fluxing material. The numerous applications of this method are well known and its limitations are fairly obvious. As this was for so long the only method of welding, great ingenuity and often great expense were involved in applying it to large or complicated parts.

Arc Welding may be divided as follows: (1) metal arc welding with bare electrodes; (2) metal arc welding with coated electrodes; (3) metal arc welding in a reducing gas flame; (4) atomic hydrogen arc welding; (5) carbon arc welding; (6) electronic tornado welding; (7) automatic arc welding. Several of these divisions may be further sub-divided as to whether the current is direct or alternating and whether the operation is manual, semi-automatic or automatic.

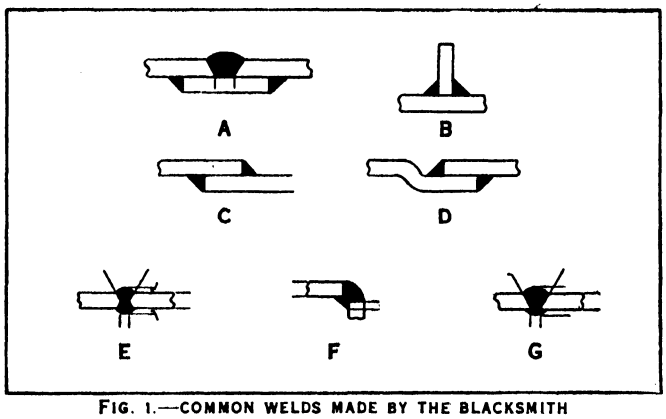

FIG. 1.—COMMON WELDS MADE BY THE BLACKSMITH

Metal Arc Welding with Bare Electrodes.—An arc is struck between the electrode, a wire or rod of suitable composition, and the parts to be welded. These should be properly shaped and are usually bevelled on both edges when plates are to be joined in the same plane by a "butt" weld. The metal is fused at both ends of the arc and the fused electrode deposited in the joint until it is properly filled. The arc should be as short as possible in order to avoid oxidation of the metal, the inclusion of harmful gases and to secure the proper penetration. As the holding of a short arc by hand requires considerable practice and skill, some of the arc welding generators are so designed that the arc will be extinguished after its length exceeds the safe limit.

Welding may be done with direct or alternating current. The alternating current is usually supplied by a suitable transformer provided with taps to adjust the current. Several types of direct current arc welding equipment are available. An arc welding outfit consists of a welding generator or transformer, a control panel for varying the current, a voltmeter and ammeter, proper lengths of cable, an electrode holder and a suitable shield or helmet for protecting the eyes of the operator.

The Welding Arc.—When direct current is used, one terminal remains positive and the greater portion of the total heat is liberated at this terminal. When alternating current is used, the terminals are alternately positive and negative so that approximately the same amount of heat is liberated at each terminal. Usually the piece of metal to be welded is considerably larger and has more mass than the electrode so that its loss of heat will be the greater due to conduction into the body of the metal and hence is made the positive side. In case, however, very thin metal is being welded, it is frequently advisable to reverse the polarity to prevent the arc burning through the metal.

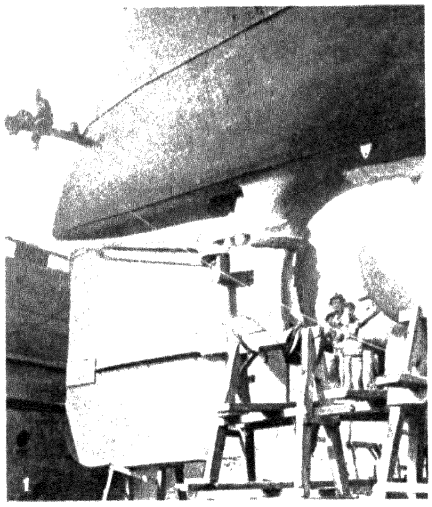
Coated Electrodes have been used in some form almost since the beginning of arc welding. In general the coatings serve as a fluxing or deoxidizing medium, or provide a protective vapour around the arc.

Arc Welding in a Reducing Flame.—A cylindrical jet of gas surrounds the electrode and burns around the arc. Pure hydrogen, water gas, alcohol vapor and a number of other gas combinations have been tried with considerable success. These welds are, in general, superior to the bare electrode welds, particularly in ductility. The reducing flame generally serves the same purpose as the electrode coatings apparently with somewhat better results.

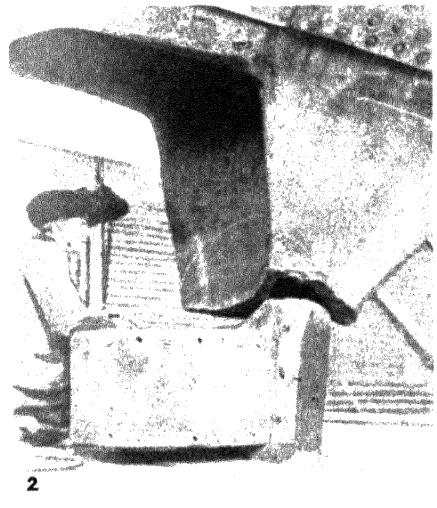
Atomic Hydrogen Arc Welding.—A fine jet of hydrogen is forced through an arc formed between two tungsten electrodes. The high temperature of the arc breaks up the hydrogen molecules into hydrogen atoms, which recombine into molecules after passing through the arc, giving up the heat absorbed during dissociation in the arc. The result is a jet flame of hydrogen burning in a hydrogen atmosphere at a temperature higher than that of any other known flame, but lower than that of the arc itself. The welding wire is fused in this flame and deposited in the joint. The intensely reducing character of this hydrogen flame results in a nearly perfect weld practically as good as the parent metal.

Carbon Arc Welding was first invented in 1881. An arc is struck between a carbon (or graphite) electrode and the parts to be welded. The welding wire is then fed into the arc and fused into the joint. In some cases the welding rod is laid in the joint groove and the carbon arc passed slowly along the joint until the fusion is complete.

Electronic Tornado Welding uses a magnetically controlled carbon arc which produces welds with good ductility. Oxidation is largely prevented in this process. Great speeds are possible although the application is limited to "downward" welding.



Automatic Arc Welding.—The great advantage of the automatic welder is that the arc length and other variables are much more accurately controllable and constant than with the most skillful hand operator. It is also a great labour saver and the speed of welding can be greatly increased. There are also semi-automatic arc welding machines in which the feed of the electrode and the arc length are under automatic control, but the "travel" or movement of the arc along the seam is under hand control. This largely eliminates the demand for great skill on the part of the operator and is at the same time applicable to a number of situations where the full automatic machine could not be used.



Gas Welding.—This process of fusion welding is generally carried out by the heat produced by the burning of acetylene in the presence of commercially pure oxygen, the flame temperature so attained being probably about 5,500° F, which, in view of the concentrated flame, is high enough to melt any metal locally, and so allows pieces to be easily fused together. It is necessary, when welding thick materials, to bevel the edges to be joined so they form a "v," which is filled up by melting into it a rod of suitable composition, the weld metal also being fused to the base metal. The joint, well made, is clean and sound, free from injurious defects, and usually as strong or stronger than the parts joined.

Torches.—Any oxy-acetylene welding torch is an instrument that thoroughly mixes the two gases, oxygen and acetylene, in the proper amounts and that permits easy adjustment and regulation of the flame. A small flame and little heat are required for welding thin gauge metals and a large flame and much heat when welding heavy sections. This is the reason for the interchangeable tips furnished by the torch manufacturers. Broadly speaking, there are two types of torches—pressure and low pressure. In the pressure type of torch, both acetylene and oxygen are supplied to the torch under appreciable pressures, the pressures being increased for each larger size of tip used. In the low pressure or injector type of torch, the oxygen only is under pressure, The mixing chamber is made on the same principle as an ordinary steam water injector so that the volume of acetylene going into the mixture is dependent upon the velocity, and not the volume of oxygen.

Flame Adjustment and Manipulation.—It is necessary at all times that the welding flame be neutral, that is, that there be no excess of acetylene or oxygen. When there is an excess of acetylene the hot inner cone is ragged and poorly defined. When there is an excess of oxygen the inner cone is short and has a pale violet colour. The inner welding flame should not play directly on the welding rod but around it in a semi-circular fashion, the rod being melted by the radiating heat of the flame. The heat should be evenly distributed on each side of the joint in order to melt down the walls and to secure thorough penetration and union of the adding material and parent metal. It is also essential that the torch oscillations be regular, otherwise fusion will be more thorough on one side of the joint than on the other.

Reinforcement.—As the weld proceeds, the rod metal should

be added until the surface of the joint is built up a little above the edge of the plates. This reinforcement is customary in all welding on steel plate. The small amount of oxide that forms during welding and impurities remains on the surface as a scale and can be easily removed when cold, by grinding or machining.

Fluxes.—Except in the welding of wrought iron and steels, fluxes are usually required for satisfactory results. Impurities on the surface of the metal or impurities contained in the metal

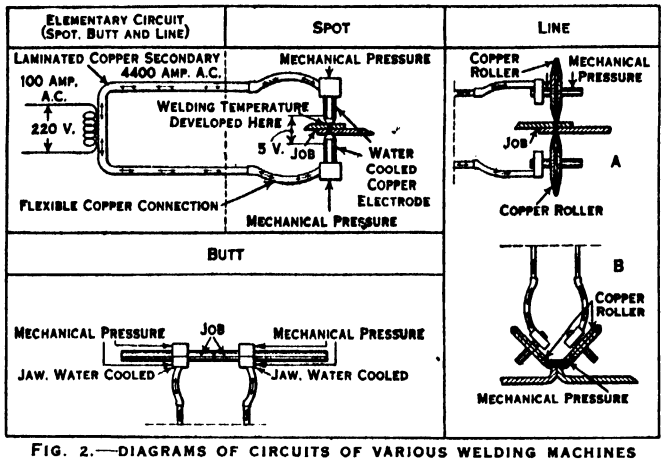

FIG. 2.—DIAGRAMS OF CIRCUITS OF VARIOUS WELDING MACHINES

find their way into the weld and must be floated out as slag to prevent damage to the weld. The combination of a suitable flux with these impurities produces the slag.

Cutting of Metals by Torch.—The cutting torch differs from the welding torch in that in addition to having the oxy-acetylene heating flame it also has another gas stream of pure oxygen under high pressure which does the cutting after the metal is raised to the ignition point by the heating flame. The iron and oxygen combine to form iron oxide, thus burning a narrow slit or "kerf" in the steel. It is a chemical process and should not be confused with melting. It is a very rapid form of rusting. Sometimes hydrogen is used in welding and cutting operations instead of acetylene.

Resistance Welding.—In this method, invented about 40 years ago by Elihu Thomson, the parts to be joined, after proper shaping, are pressed together. A large current is then passed through the joint until it has reached welding temperature, when further pressure is applied, upsetting the joint and completing the weld. As the electrical resistance of the contact surface is much greater than that of the solid metal, most of the heat is generated at the joint surface where it is desired.

The voltage required is so low and the current so high that the only convenient source is an alternating-current transformer built into the welder and as close as possible to the jaws which hold the parts and transmit the current to them. For work of any considerable size, these machines are not readily portable, *i.e.*, the work must ordinarily be brought to the machine. The simple type of resistance welding described above is usually known as *butt welding*, and has been applied to join sections of widely varying shapes up to 36 sq.in. in a section.

Flash Butt Welding.—Parts to be welded are clamped, the primary circuit closed and the ends of parts brought together slowly. When these ends touch they will "flash," that is, minute particles of molten metal will fly off; this flashing is continued until the entire faces of the abutting ends have reached a welding heat when heavy pressure is applied, forcing the ends together and completing the weld. This is often regarded as the preferred method of welding, as the power and time consumption are small and the personal equation of the operator is less important than in any other type of weld.

Spot Welding.—Where air-tightness is not required, a lap seam may be welded in spots by clamping the seam overlap between two electrodes and passing the necessary current between them and through the overlapping edges of the plates. As the electrical resistance of the surface contact is least in the region under pressure, most of the current and therefore the weld is confined to a spot of about the same area as that of the electrodes. For relatively thin metal this method is much more rapid and economical than any other known method of making a joint where mechanical strength alone is the chief consideration. The mechanical strength obviously depends upon the number and size of the spots.

Seam Welding.—The overlapping edges of sheet metal are passed between two narrow roller electrodes, the speed, current and pressure being so adjusted as to produce a continuous seam weld. This method is usually limited to relatively thin sheets, but is readily applicable to straight seams or to circular seams. The employment of this method for the manufacture of barrels, small transformer tanks and numerous other similar containers, has resulted in a very large saving in cost.

Alumino-Thermic (Thermit) Welding.—Thermit is a trade name for a mixture of finely divided aluminium and iron oxide, which when ignited reacts to produce a superheated liquid steel at 5,000° F. The underlying principle of the thermit process is the high chemical affinity of aluminium for oxygen. Up to a temperature of 2,800° F thermit is an inert mixture. At that temperature, however, the aluminium unites with the oxygen of the iron oxide, and the iron is set free and becomes a highly superheated liquid steel. It is obvious that if steel at this temperature is poured around the sections to be united, especially if the sections have previously been preheated to a bright red heat, it will melt those sections and amalgamate with them so that the whole will cool to form a single homogeneous mass, or in other words a fusion weld.

Making a Thermit Weld.—In making a thermit weld, the parts to be united are first lined up with a space between the ends to be welded, the extent of which depends upon the size of the sections to be welded. The adjacent ends are then thoroughly cleaned by a sand blast or other suitable means. A wax pattern is then formed around the ends to be united of the exact shape of the thermit steel to be cast. A sand mould is next rammed around the wax pattern and inside a sheet iron box provided with pouring gates, heating gates and risers. A basin on the top of the mould serves to catch the slag when the pour is made.

The flame of a compressed air liquid fuel (gasolene or kerosene) heater, directed into the heating gate melts the wax pattern and leaves a space for the thermit steel. The heat is continued until the parts to be united have been brought to a good, red, workable heat. By that time the mould will have become dried out. In the meantime the charge of thermit is placed in a conical shaped

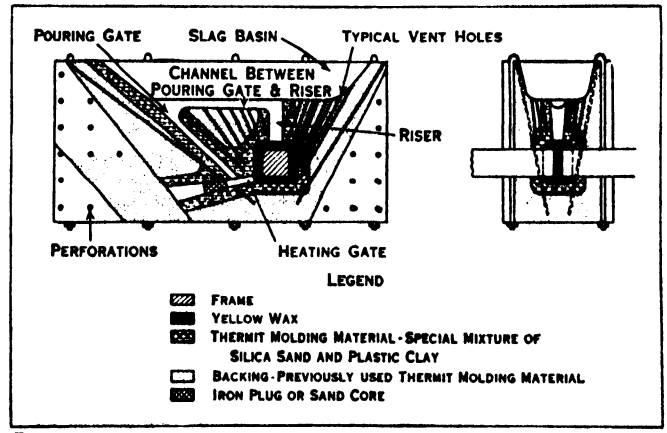

FIG. 3.—METHOD OF CONSTRUCTING MOLDS FOR MAKING THERMIT WELDS

crucible supported over the pouring gate of the mould. When the sections are red hot and the mould dried, the application of heat is discontinued, the heating gate plugged up and the thermit charge in the crucible ignited. In 25 to 35 seconds the thermit reaction is completed and the thermit steel tapped from the bottom of the crucible into the mould where it flows around and between the sections to be welded, uniting them into one homogeneous mass.

(WM. SP.)

WELF or **GUELPH,** a princely family of Germany, descended from Count Warin of Altorf (8th century), whose son Isenbrand is said to have named his family *Welfen, i.e.,* whelps. From his son Welf I. (d. 824) were descended the kings of upper Burgundy and the elder German line of Welf. Welf III. (d. 1055) obtained the duchy of Carinthia and the March of Verona. With him the elder line became extinct, but his grandson in the female line, Welf IV. (as duke, Welf I.), founded the younger line, and became duke of Bavaria in 1070. Henry the Black (d. 1126), by his marriage with a daughter of Magnus, duke of Saxony, obtained half of the latter's hereditary possessions, including Lüneburg, and his son Henry the Proud (*q.v.*) inherited by marriage the emperor Lothair's lands in Brunswick, etc., and received the duchy of Saxony. The power which the family thus acquired, and the consequent rivalry with the house of Hohenstaufen, occasioned the strife of Guelphs and Ghibellines (*q.v.*) in Italy. Henry the Lion lost the duchies of Bavaria and Saxony by his rebellion in 1180, and Welf VI. (d. 1191) left his hereditary lands in Swabia and his Italian possessions to the emperor Henry VI. Thus, although one of the Welfs reigned as the emperor Otto IV., there remained to the family nothing but the lands inherited from the emperor Lothair, which were made into the duchy of Brunswick in 1235. Of the many branches of the house of Brunswick that of Wolfenbüttel became extinct in 1884, and that of Lüneburg received the electoral dignity of Hanover in 1692, and founded the Hanoverian dynasty of Great Britain and Ireland in 1714. For its further history *see* HANOVER.

See Sir A. Halliday, *History of the House of Guelph* (1821); R. D. Lloyd, *Historical Chart and notes on the origin of the British Victorian Monarchy* (cover title, *Origin of the Guelphs*) (1892); F. Schmidt, *Die Anfänge des welfischen Geschlechts* (Hanover, 1900).

WELFARE WORK. This term, as applied to industry, has been well defined by Dr. Royal Meeker as "anything for the comfort and improvement, intellectual or social, of the employees, over and above wages paid, which is not a necessity of the industry, nor required by law." *See* INDUSTRIAL RELATIONS; OFFICE MANAGEMENT.

Welfare Work in Great Britain.—Of course, ever since there have been employers some of them have done their utmost to promote the welfare of their employees, but so long as industry was conducted in small units, no organized welfare work was required. It was only with the introduction of the factory system that the personal links between master and man were gradually broken, and with the development of joint stock limited liability companies, business became increasingly impersonal. As a rule, unfortunately, in the early days of large scale manufacture, the attention of the employing class was devoted almost exclusively to the financial and mechanical aspects of business; and the workers were regarded merely as instruments of production, not as men, women and children whose individual well-being was a matter of importance. It is significant that they were generally called "hands," while their employer was tacitly assumed to represent the controlling will and brain. Gradually, however, a sense of responsibility for the welfare of these "hands" developed. It was due, in Great Britain, to many causes, partly to the activities of the trade unions, partly to the development of education, which tended to break down class divisions, and to make employers and workers better acquainted with each other, and partly to the various factory acts. These compelled every factory to adopt certain precautions and safeguards, and drew the attention of the general public to a side of industry which had been neglected.

But although the attitude of the employing class to the workers was gradually changing for the better throughout the 19th century, organised welfare work has only been undertaken on an extensive scale since 1914. As recently as 1913, a careful investigation into the facts showed that only about 30 employers in Great Britain were definitely engaged in welfare work. Fifteen years later the number had grown to over a thousand.

This great increase in so short a time was due to two causes. The first was the revolutionary change in the relations between capital and labour for which the World War was largely responsible. No one acquainted with industry can doubt that the war developed a more liberal spirit among employers.

The second cause is the great prominence given by the British Government during the war to welfare in munition factories. First, a committee was appointed to investigate and report upon all questions affecting the health of munition workers. It considered such matters as hours of work, canteen facilities, sanitation and protection against poisons; and it issued a number of valuable reports, which formed the basis of Government regulations. But another step was taken—namely, the creation within the Ministry of Munitions, of a welfare department concerned solely with the development of welfare conditions in the thousands of munition factories controlled by the State. This department had a staff of inspectors, who visited the factories and arranged for the introduction of various welfare measures, and for the appointment of large numbers of welfare supervisors, whose duty it was to deal with all matters affecting the health and comfort of the workers. In these ways, the Government gave to the whole country a striking object-lesson in organised welfare work, and we can hardly wonder that such work is now a definite and important factor in British industry. Two British societies, one actively presided over by the duke of York, are engaged in developing the movement. One of these works primarily with and through "welfare supervisors," as the officers engaged in organised welfare are often termed; the other is concerned with encouraging firms to undertake organised welfare work, and advising them as to the best and wisest modes of procedure.

Forms of Welfare Work.—Welfare work takes many forms: they are briefly indicated in the following summary, drawn up by the (British) Industrial Welfare Society—

Employment: Interview, Preliminary selection, Waiting list, Records and progress, Lost time and absentees, Transfers and promotion, Dismissal, Transport.

Co-operation: Suggestions and Complaints, Works and Welfare Committees, Works Magazine.

Education: Technical instruction, Continuation Classes, Lectures.

Health: Protective Clothing, Rest and Cloak Rooms, First-aid and Ambulance, Medical Service, Records and Research, Dental Service, Optical Service, Sick Visiting, Convalescence, Rest Pauses, Canteen, Heating, Lighting, Ventilation, Sanitation.

Thrift: Sick and Benevolent Societies, Superannuation and Pension Funds, Holiday Funds, Tool Funds, etc., Saving Schemes, Protective Devices.

Accident Prevention: Accident Prevention Campaigns, Safety Instructions, Inspections, Records, Fire Drill.

Leisure: Outdoor Activities, Indoor Games and Hobbies, Co-operation with Local Agencies, Lodgings Register, Institute and Hostel Management, Camps and Holiday Schemes.

Economics of Welfare Work.—It is not, of course, suggested that all the above activities find a place in every factory which has definitely undertaken welfare work; but the tendency is certainly to advance from one activity to another. The perusal of the somewhat formidable list may suggest two questions which must be answered in any careful appreciation of welfare work. The first is:—"Are all these measures really necessary or even desirable?" and the second is "Does it pay?" The answer which those who believe in welfare work would give to the first question would be along the following lines. Industry is the life-blood of the modern nation. Most people, during a greater or less part of their lives spend at least half their waking hours at work, and if society as a whole is to be healthy, cultured, and prosperous, no employer can afford to ignore what may be termed his social obligations towards the workers within his own factory. In a well organised community, it should be possible for men and women to live full, healthy lives all the while. Work should not be regarded as an inevitable deduction from the happiness of life, but as an integral part of that happiness. Therefore, just as much consideration should be shown towards members of the community while at work, as during their leisure hours. The State, through its factory acts, demands a steadily rising minimum standard in working conditions, but this is necessarily a soulless and unsatisfying standard. A factory which complied strictly with all legal requirements might yet be an appalling place in which to spend nearly half one's waking life.

Welfare work seeks to remedy this deficiency, and so far as it is possible, to carry out social ideals in the factory. It regards the

workers, therefore, as ends in themselves, not merely as a means to an end. All welfare questions should be handled by persons carefully selected for their intelligent human sympathy. It must be recognised that the care of the workers is a more expert business than even the care of the most intricate and delicate machinery. It cannot be handed over to men who have not the necessary experience and special qualities. In a large factory the recognition of this fact will involve the organisation of a carefully staffed labour department, while in a small one, it may only mean the handing over of all labour questions to a qualified officer who has other duties. In either case, if the employment manager or the welfare supervisor be wise, he will soon learn to avoid the spirit of paternalism, which was somewhat too characteristic of many early experiments in welfare work. He must enlist the help of the workers to achieve the desired ends. This will lead to a better mutual understanding between employer and employed—and probably to the establishment of works councils, where an ever growing list of subjects of joint interest will be discussed by management and men. The welfare supervisor is really the liaison officer between capital and labour.

Although, in the definition of welfare work given at the beginning of this article, the question of wages was excluded, the welfare spirit, out of which welfare work springs, cannot disregard that question. It is not for the welfare officer to dictate the scale of wages, but if the management is not paying a living wage, it is quite within his sphere to call their attention to the fact.

There can be no true welfare unless reasonable living wages are paid, or, if this is temporarily out of the question, unless every effort is being made to raise the efficiency of the organisation to the point at which their payment becomes possible.

The second question referred to above "Does welfare work pay?" has in part been already answered. Of course, it is not possible to draw up a profit and loss account showing the precise cost of welfare work on the one hand and the precise gain derived from it on the other. What, for instance, is the value, in pounds or dollars, of a spirit of co-operation between capital and labour? What is the value of a higher standard of health, due to an efficient works medical department? These questions defy strict analysis.

It can, however, be said without a shadow of doubt that welfare work pays whenever it is the natural outcome of a belief on the part of the management that the welfare of all engaged with them in their enterprise is a matter of real moment—that industry is fundamentally a human activity, whose success or failure is eventually to be measured by its effect on human society. Any welfare scheme undertaken merely to "make the beggars work" or to swell the dividends of the shareholders will never succeed.

Some of the finest welfare work is done in little factories, where the profits earned are not high, but where the employer has real sympathy with his workers, and does his best to surround them with the kind of environment he would desire for his own children. The items to enter on the debit side of his welfare account might not to any high degree interest the works auditor. But there are also factories where very large sums are paid for welfare work. There are costly pension schemes, medical departments and provisions for education, and recreation. Do these pay? Probably the return on the expenditure varies from factory to factory. It will depend on the spirit in the factory, and the intelligence with which the expenditure is incurred. But a few observations may suggest the angle from which this matter should be considered. Take, for instance, a pension fund. It absorbs a given sum per annum, and all workers retire at pension age. The cost of that fund may appear to be high—but how much are many organisations paying yearly through their wage rolls to men who ought to be on pension? Again, a factory medical or dental service may cost a considerable sum, but there is also a considerable difference between the value, say, of a purchasing agent who has a headache, or toothache, and one who is perfectly fit. We must strike a ratio between the cost of the medical service and the total wage and salary bill. The former is unlikely to amount to as much as one half of one per cent of the latter.

Incidentally, reference may be made to a striking example of the British Government's appreciation of the value of welfare work. Under the Mining Industry Act of 1920, power was given to raise a levy of a penny on every ton of coal raised to create a fund, known as the miners' welfare fund. Up to 1927 over five million pounds was thus raised, of which £2,726,000 was spent on recreation and £1,696,000 on hospitals, convalescent homes and other health services. The fund is administered by a central committee consisting of owners, miners and other persons appointed by the Board of Trade, and by a number of district committees consisting of owners and miners. Under a more recent act (the Mining Industry Act of 1925) the royalties welfare levy is producing more funds, available for pit-head baths.

In conclusion, there are three ideas of welfare work. The first is merely that it is a fad, or a hobby: the second that it is good because it pays; the third that it is an essential condition of good management, and an inevitable outcome of modern ideas regarding the relationship of industry to society and the responsibilities of industrial management. The last idea is the right one.

WELHAVEN, JOHANN SEBASTIAN CAMMERMEYER (1807–1873), Norwegian poet and critic, was born at Bergen. He first studied theology, but from 1828 onwards devoted himself to literature. In 1840 he became reader and subsequently professor of philosophy at Christiania, and delivered a series of impressive lectures on literary subjects. In 1836 he visited France and Germany; and in 1858 he went to Italy to study archaeology. Welhaven made his name as the representative of conservatism in Norwegian literature. He represented clearness and moderation against the extravagances of Wergeland. He gave an admirable practical exposition of his aesthetic creed in the sonnet cycle *Norges Daemring* (1834). He published a volume of *Digte* in 1839; and in 1845 *Nyere Digte*. His descriptive poetry is admirable, but his best work was inspired by his poems on old Norse subjects, in which he gives himself unreservedly to patriotic enthusiasm.

His critical work includes *Ewald og de norske Digtere* (1863), *On Ludwig Holberg* (1854). Welhaven's *Samlede Skrifter* were published in 8 vols. at Copenhagen (1867–69).

WELL. An artificial excavation or boring that derives some fluid, usually water, from the interstices of the rocks or soil which it penetrates. Wells are classified mainly according to the method of sinking, the depth, character or geologic horizon of the bed that yields the water, capacity or head of water. Thus, according to the method of sinking are wells distinguished from borings, the former being divided into ordinary shallow or surface wells as distinguished from deep, or sometimes erroneously termed artesian, wells. Such wells are generally circular excavations ranging from 3 or 4 ft. to 15 ft. or more in diameter, usually lined with brickwork, concrete or cast iron for some depth down from the surface, and may be either dug or drilled by special tools.

The term borings is applied to sinkings of smaller size, ordinarily up to 36 in. in diameter, excavated by means of a drill, either percussion or rotary, which operates either by cutting or by abrasion, and in which the débris is brought up to the surface by means of a shell-pump, hollow drill-tool, or by a hydraulic or self-clearing method. Borings of this kind are usually lined with steel tubes through unstable materials, the tubes being perforated where in contact with water-bearing strata. In addition there is the driven well, which is sunk by driving a casing at the end of which is a conical point, water being admitted for supply through the point or through perforations in the casing immediately above it. Frequently, however, a well may consist of a combination of a well and boring, the boring being sunk through the bottom of the well; or adits or headings may be driven horizontally from the bottom of a well in different directions into the water-bearing stratum.

The shallow well is sunk into water-bearing strata at or near the surface, and in populous or cultivated districts the water is apt

to be contaminated by sewage or other surface sources of pollution. Deep wells, if lined to some depth from the surface, draw upon deeper zones, and usually afford larger and purer supplies.

The term *artesian* as popularly applied to wells is ambiguous. Strictly, artesian water is water which is confined under pressure beneath an impervious stratum, and, rising up through the penetrating well or boring, overflows the surface of the ground above the normal ground-water surface of the district.

Thus in fig. 1 there are shown two water-bearing formations A and C separated by an impervious stratum B of shales and

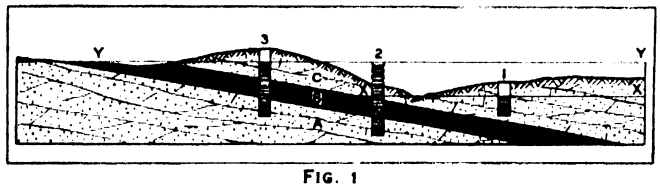

FIG. 1

clays. The surface of the ground-water, or saturation level, YY in the bed A stands at a higher level than that of XX in the bed C, being held down by the impervious bed B. The well 1 in the shallow surface bed is a shallow surface or dug well, which taps the immediately underlying ground-water, the level of which is below the surface of the well. The well 2 is a true artesian or artesian-flowing well. The well 3, in which artesian water from a lower stratum is tapped but does not overflow, is known as a non-flowing or sub-artesian well.

The function of a well is to tap the underground or ground-water which may occur in the pores of the water-bearing formations, or if in solid rocks, the water in the fissures, joints, faults, bedding planes and other openings. Water from porous strata is most freely and directly obtained from superficial beds of gravels and sands of alluvial or glacial origin. In hard rocks such as sandstones, chalk and conglomerates which are exceedingly porous, wells are capable of affording copious yields only when the ground-water is directly tapped in open cavities, such as bedding planes, fissures and the like, the water in these openings being fed and maintained by slow seepage from the pores of the rock from a vast area. Wells in formations such as the chalk, for example, may be practically dry if sunk in the mass of the rock itself without penetrating any fissure or other natural channel with water.

The most successful wells derive their supplies from rocks of later age than the Palaeozoic formations. With the exception of a few of the higher strata, such as the Permian limestones and sandstones and the Millstone Grits of the Carboniferous, the older rocks in general are highly consolidated by pressure and their pores cemented by minerals, hence they are incapable of affording large supplies of ground-water. The sandstones of the Trias, the limestones of the Jurassic and the chalk and sands of the Cretaceous have yielded the most copious underground supplies in Britain and the Continent, and generally the world over the Secondary and later formations are the most prolific. In Britain the glacial and alluvial gravels and sands of the Post-Tertiary are thin and not so extensive as elsewhere and in consequence afford only relatively small supplies, but in many other parts of the world copious yields are obtained from these later deposits. The water bearing properties of the crystalline or igneous rocks are similar to those of the older formations, and underground supplies from them are dependent upon the presence of fissures or joints, hence the yields are almost universally small.

Hydraulics of Wells.—Fig. 2 illustrates an ordinary well KH sunk through a water-bearing stratum to H the surface of an impervious bed at the level GHJ. Normally the surface of the ground-water lies below the ground at a level AE which is known as the surface of saturation, water-table, ground-water level, or, in relation to wells, rest-level. The effect of pumping water from the well is to lower the water in the well to a level F known as the working- or pumping-level, which varies according to the rate of pumping, becoming increasingly lower as the rate of pumping is increased. Outside the well the effect of pumping is to draw in radially the surrounding water to the well, and the surface of saturation in the vicinity assumes the form of an inverted cone or bell. This figure BFD is known as the cone of depression, which dies out along a line theoretically forming a circle around the well, and known as the circle of influence of radius BC or CD in fig. 2.

In actual practice the circle of influence may be far from a true circle, forming a figure which extends irregularly in different directions according to geological circumstances; for only in absolutely uniform and homogeneous sand or gravel, not found in nature, could the theoretical conditions be obtained. The slopes of the cone are theoretically sub-logarithmic curves, and although irregular in actual practice often approximate to theory, especially in deposits of sands and gravels.

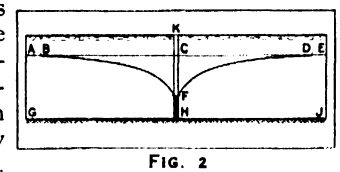

FIG. 2

In solid rocks again, while borings in the vicinity of a well indicate there is a local depression, it is doubtful if the surrounding water-levels indicate more than the water-levels in the actual fissures and other openings penetrated.

The radius of the circle of influence is dependent mainly on two factors, viz., the transmitting capacity of the water-bearing medium and the rate of pumping, or alternatively the lowering C.F. at the well; but a third factor of influence is the natural slope of the water-table in the vicinity.

Theory and practice have established that, except when excessive, lowering of the water-level in a well in porous media is approximately proportional to the rate of pumping, and that at a given rate of pumping, provided that is not greater than the maximum yield of the well, the water will fall to a definite level and, subject to seasonal fluctuations, remain stationary at that level. A further principle of importance has also been established both by theory and practice, viz., that the effect of size or diameter of a well is of less importance than might be assumed, borings of only a few feet in diameter affording copious yields not greatly less than those of wells of large diameter.

Testing of Wells.—The yields of small wells or borings are usually tested by pumping continuously over a period ranging from a few days to a fortnight until a permanent working-level is maintained. For large public wells, however, much longer periods are required, and it may be a year or more before a final state of equilibrium is obtained.

The term *specific capacity* is frequently used in relation to testing, and is a numerical expression of the readiness with which a well furnishes water to the pumps. It depends on the transmission capacity of the water-bearing stratum, the resistance of the strainer when present, the thickness of water-bearing stratum penetrated, and to some extent on the diameter of the well. This factor is merely the yield per foot of lowering of the water in a well, or the gross yield divided by the working head. Successful public wells in sands similar to the Lower Greensand have a mean specific capacity of about 500 gal. per hour, Triassic wells 500 to 800, and Chalk wells about 1,800 gal. per hour, but the figures are extremely variable, maximum values being as much as double these figures. In the case of wells with headings, however, it is doubtful if the specific capacity is of any value as an index.

Wells in Sands.—Wells in sands, especially where the deposits are fine-grained, may be lined wells of large diameter, the lining extending to the full depth of the well. The water is obtained either by upward percolation from the bottom of the well only, or by means of perforations, with or without fine wire-gauze strainers, in the sides of the lining. Where borings are sunk into such material the lower portion of the lining tubes may be perforated with small holes, which may or may not be covered with a straining material. Frequently a series of such borings in close proximity are placed at right angles to the direction of natural flow of the ground-water and connected to a common suction-pipe.

Records of Actual Wells.—In Britain wells or borings in the New Red Sandstone have afforded permanent yields up to a maximum of 4 or 5 million gallons per diem, and the Chalk up to 7 million gallons per diem; but the supplies of large public wells in these formations usually vary between a few hundred thousand to one or two million gallons per day. In the Oolite yields up to 3 million gallons per day have been obtained, but these are quite

exceptional. Wells in Millstone Grit and Coal Measures rarely afford more than 500,000 gallons per day, and other geologic formations only relatively small supplies. The effect of pumping in large public wells in Britain does not appear to extend more than about two miles in the New Red Sandstone and about one mile in the Chalk. In California, however, a test of pumping at rates between 8 and 20 million gallons per day in alluvial deposits proved the consequent lowering to extend to five miles.

Of wells of record yield in other countries may be mentioned a well at St. Augustine stated by Slichter (1902) to yield 10 million gallons a day, and another in South Dakota reported to yield as much as 11½ million gallons a day.

The deepest boring sunk for water is probably that at Putnam Heights, Connecticut, which reached a depth of over 6,000 ft. in crystalline rock without obtaining a significant supply. In Australia many artesian borings are sunk to depths of over 4,000 ft. and obtain supplies ranging from 100,000 to 1,400,000 gal. per day. The deepest borings in the world sunk for either oil or water are the Olinda well, Orange County, Calif., and the Ligonier deep well near Latrobe, Pa. The former is 8,201 feet deep and the latter 7,756 feet deep. In general, except where there are true artesian conditions on a vast scale, it is little use to sink below 1,500 feet.

The effect of pumping excessive quantities of water from underground sources has frequently been to lower the general water-level of the district, and this has taken place under London, Birmingham and Liverpool in Britain, and around Chicago, Memphis, Savannah, the Dakota basin and other districts in the U.S.A.

Artesian Basins.—The chief artesian areas in Europe are around London and Paris. In the United States the basins of Dakota, New Mexico, Potsdam and the Atlantic coastal plain are the most remarkable. In Queensland, New South Wales and South Australia deep seated artesian water is found in vast quantities, while in Africa the artesian areas of Cape Colony and the Sahara desert are of special note.

The London and Paris basins derive their supplies from deep seated Chalk and Tertiary strata, the former affording supplies amounting in all to many million gallons per day to hundreds of wells beneath London.

The Dakota basin which underlies large areas in South Dakota, Colorado, Nebraska and Kansas, is of special interest, thousands of borings deriving artesian supplies from the Dakota Sandstone, which outcrops in the mountains to the west of the area and passes beneath the basin at depths of 1,000 ft. or more and reappears in the east at a distance of 200 m. or more from the western outcrop. The yield of the whole basin is about 125 million gallons per day.

The Roswell area in south-eastern New Mexico derives its artesian supply chiefly from creviced and cavernous limestone. The total annual yield from more than 1,400 wells is about 200,000 acre-feet which is used chiefly for the irrigation of approximately 60,000 acres of farm land. The largest flowing well in the area yields over 8,000,000 gallons a day. The Atlantic Coastal Plain extends from Long island in the north to Texas in the south.

The Australian artesian areas, and especially that of Queensland, afford remarkable yields. The Queensland basin is estimated to supply a total of over 350 million gallons per day. Over 1,000 borings have been sunk, some exceeding 4,000 ft. in depth. The New South Wales and South Australia basins are of considerably less importance. The three basins all derive their supplies from the Cretaceous rocks.

The Cape Colony area derives its supplies from the Karoo beds of triassic age at shallow depths. Nearly 3,000 boreholes have been sunk, but the individual yields are small.

The Sahara basin in the vicinity of Algeria is noteworthy, in that the artesian water is derived from beds of Pliocene sands which outcrop in the Atlas mountains about 300 miles distant. The underground water has been found to follow definite open channels, and small fish, river-crabs and fresh-water molluscs are brought up in quantities in some of the borings, which vary from 150 to 800 ft. in depth. Over 100 million gallons per day is obtained from this basin.

BIBLIOGRAPHY.—Numerous Water Supply and Irrigation Papers of the United States Geological Survey, in particular No. 67 by C. S. Slichter (1902), and the 19th Annual Report of the U.S. Geological Survey, Slichter and King (1897–98), where full references are given to previous investigators, pp. 381–384; W. S. P. 494, "Outline of Ground-water Hydrology" by O. E. Meinzer (1923); W. S. P. 439, "Occurrence of Ground-water in the United States" by O. E. Meinzer (1923). Baldwin Wiseman, Min. Proc. Inst. C.E., vol. CLXV. (1905–06), Pt. III, on "The Flow of Underground Water," where numerous further references, both theoretical and practical, are given. (*See* BORING and DRILLING). (H. LA.)

WELLES, GIDEON (1802–1878), American political leader, was born at Glastonbury (Conn.), on July 1, 1802. He studied for a time at Norwich University, Vt., but did not graduate. From 1826 to 1837 he edited the Hartford *Times*, making it the official organ of the Jacksonian democracy in southern New England. After service in the State house of representatives, he left the Democratic Party on the Kansas-Nebraska issue, assisted in the formation of the Republican Party in Connecticut, and was its candidate for governor in 1856.

On the inauguration of President Lincoln in 1861 he was appointed secretary of the Navy, a position which he held until the close of President Andrew Johnson's administration in 1869. Although deficient in technical training, he handled with great skill the difficult problems which were presented by the Civil War. The number of naval ships was increased between 1861 and 1865 from 90 to 670, the officers from 1,300 to 6,700, the seamen from 7,500 to 51,500, and the annual expenditure from $12,000,000 to $123,000,000; important changes were made in the art of naval construction, and the blockade of the Confederate ports was effectively maintained. Welles supported President Johnson in his quarrel with Congress, took part in the Liberal Republican movement of 1872, and returning to the Democratic Party, warmly advocated the election of Samuel J. Tilden in 1876. He died at Hartford (Conn.), on Feb. 11, 1878.

While Welles was in President Lincoln's Cabinet, he kept a diary of the stirring events happening daily. This manuscript, though greatly amended by Welles in later years, is a valuable historical source. But the published diary is unreliable because it makes no distinction between the entries that were contemporaneous and those that Welles made in his old age.

In 1874 Welles published *Lincoln and Seward*, in which he refutes the charge that Seward dominated the Administration during the Civil War. His *Diary* was published in the *Atlantic Monthly* (1909–10).

See Albert Welles, *History of the Welles Family* (New York, 1876); also "Is the Printed Diary of Gideon Welles Reliable?", *Amer. Hist. Rev.* vol. xxx., and *Life of Gideon Welles*, R. H. Wood.

WELLESLEY, RICHARD COLLEY WESLEY (or WELLESLEY), MARQUESS (1760–1842), eldest son of the 1st earl of Mornington, an Irish peer, and brother of the famous duke of Wellington, was born on June 20, 1760. He was sent to Eton, and to Christ Church, Oxford. By his father's death in 1781 he became earl of Mornington, taking his seat in the Irish House of Peers. In 1784 he entered the English House of Commons as member for Beeralston. Soon afterwards he was appointed a lord of the treasury by Pitt. In 1793 he became a member of the board of control over Indian affairs and in 1797 accepted the office of governor-general of India. Wellesley seems to have caught Pitt's large political spirit during his intercourse with him from 1793 to 1797. That both had consciously formed the design of acquiring empire in India is not proved; but the rivalry with France made Wellesley's rule in India an epoch of enormous and rapid extension of English power. Clive won and Warren Hastings consolidated the British ascendancy in India, but Wellesley extended it into an empire. For the details of Wellesley's Indian policy *see* INDIA: *India under the Company.*

He found the East India Company a trading body, he left it an imperial power. He was an excellent administrator, and sought to provide, by the foundation of the college of Fort William, for the training of a class of men adequate to the great work of governing India. A firm free trader, like Pitt, he endeavoured to remove some of the restrictions on the trade between England and India. Both the commercial policy of Wellesley and his educational projects brought him into hostility with the court of directors, and he more than once tendered his resignation, which,

however, public necessities led him to postpone till the autumn of 1805. He reached England just in time to see his friend Pitt before his death. He had been created an English peer in 1797, and in 1799 an Irish marquess.

On the fall of the coalition ministry in 1807 Wellesley was invited by George III. to join the duke of Portland's cabinet, but he declined, pending the discussion in parliament of certain charges brought against him in respect of his Indian administration. Resolutions condemning him for the abuse of power were moved in both the Lords and Commons, but defeated by large majorities. In 1809 Wellesley was appointed ambassador to Spain. He landed at Cadiz just after the battle of Talavera, and endeavoured, but without success, to bring the Spanish government into effective co-operation with his brother in Portugal. A few months later Wellesley became foreign secretary in Perceval's cabinet. He retired in February 1812, partly from dissatisfaction at the inadequate support given to Wellington by the ministry, but also because he was convinced that the question of Catholic emancipation was urgent. With the claim of the Irish Catholics to justice he henceforward identified himself.

On Perceval's assassination he refused to join Lord Liverpool's administration, and he remained out of office till 1821, criticizing with severity the proceedings of the congress of Vienna and the European settlement of 1814. He was one of the peers who signed the protest against the enactment of the Corn Laws in 1815. In 1821 he was appointed lord-lieutenant of Ireland. Wellesley's acceptance of the vice-royalty was believed in Ireland to herald the immediate settlement of the Catholic claims. But the hope of the Catholics still remained unfulfilled. On the assumption of office by Wellington, who was opposed to Catholic emancipation, his brother resigned the lord-lieutenancy. He had, however, the satisfaction of seeing the Catholic claims settled in the next year by the very statesmen who had declared against them. In 1833 he resumed the office of lord-lieutenant under Earl Grey's brief ministry. He died on Sept. 26, 1842.

See Montgomery Martin, *Despatches of the Marquess Wellesley* (1840); W. M. Torrens, *The Marquess Wellesley* (1880); W. H. Hutton, *Lord Wellesley* ("Rulers of India" series, 1893); and G. B. Malleson, *Wellesley* ("Statesmen" series, 1895); *The Wellesley Papers: Life and Correspondence of Richard Colley Wellesley* by the editor of "The Windham Papers" (2 vols., 1914).

WELLESLEY, a beautiful residential town of Massachusetts, U.S.A. Pop. (1920) 6,224; 1928 local estimate 12,000. On Lake Waban are the grounds of Wellesley college (*q.v.*) and opposite it is the Hunnewell estate, with its famous Italian gardens, the first in the United States. The Babson institute and the Babson statistical centre are in Wellesley and there are four private schools for girls. Wellesley was settled about 1640 and incorporated in 1881.

WELLESLEY COLLEGE, an institution for the higher education of women situated in Wellesley, Mass. It was founded by Henry Fowle Durant, a Boston lawyer, with the announced purpose "of giving to young women opportunities for education equivalent to those usually provided in colleges for young men." The first charter was granted by the Commonwealth of Massachusetts on March 17, 1870, under the name of Wellesley Female seminary. This name was changed to Wellesley college by act of legislature, March 7, 1873. In accordance with the spirit of the founder, the college is undenominational but distinctively Christian in its influence, discipline and instruction. The college grants the degrees of B.A. and M.A., and of M.S. in hygiene and physical education. Under the stimulus and inspiration of the founder, Wellesley college opened in Sept. 1875, with a curriculum remarkably in advance of its period. For example, Wellesley was the first women's college to open scientific laboratories for student experimentation. In fact, such work was offered at Wellesley earlier than at any other institution in the United States for either men or women with the exception of Harvard and the Massachusetts Institute of Technology.

The campus of more than 300ac., the gift of the founder, the buildings, and fixed equipment, were valued in the treasurer's report, on June 30, 1927, at $7,281,007, and the trust funds at $8,520,418, of which $5,866,874 are for permanent endowment. The buildings number 38 of which 20 are halls of residence. Two other halls of residence were under construction in 1928. In addition to the library, the most important of the buildings are Founders hall, opened in 1919, containing lecture rooms and department offices for the liberal arts; the Farnsworth Art building; music hall and Billings hall for the department of music; the Whitin observatory for the department of astronomy; Mary Hemenway hall containing the gymnasium; the chapel; Alumnae hall, containing a large auditorium and recreation hall, dedicated in 1923; and the botany laboratory, dedicated in Nov. 1927, fully equipped with all modern facilities. There were in 1927, 1,604 students, of which number 44 were registered for the master's degree and 1,533 for the bachelor's degree. The official staff numbered 251 of whom 166 formed the instructing body.

The college has had six presidents: Ada L. Howard, Litt.D. (1875–82); Alice E. Freeman (Mrs. George H. Palmer), B.A., Ph.D., L.H.D., LL.D. (1882–87); Helen A. Shafer, M.A., LL.D. (1888–94); Julia J. Irvine, M.A., L.H.D., LL.D. (1895–99); Caroline Hazard, A.M., Litt.D., LL.D. (1899–1910); Ellen F. Pendleton, M.A., Litt.D., LL.D. (1911–). (E. F. P.)

WELLHAUSEN, JULIUS (1844–1918), German biblical scholar and Orientalist, was born at Hameln on the Weser, Westphalia, on May 17, 1844. Having studied theology at the university of Göttingen under Heinrich Ewald, he established himself there in 1870 as *Privatdozent* for Old Testament history. In 1872 he was appointed professor ordinarius of theology in Greifswald. Resigning in 1882 owing to conscientious scruples, he became professor extraordinarius of oriental languages in the faculty of philology at Halle, was elected professor ordinarius at Marburg in 1885, and was transferred to Göttingen in 1892. Wellhausen made his name famous by his critical investigations into Old Testament history and the composition of the Hexateuch, the uncompromising scientific attitude he adopted in testing its problems bringing him into antagonism with the older school of biblical interpreters. He died at Göttingen on Jan. 7, 1918.

The best known of his works are *De gentibus et familiis Judaeis* (Göttingen, 1870); *Der Text der Bücher Samuelis untersucht* (Göttingen, 1871); *Die Pharisäer und Sadducäer* (Greifswald, 1874); *Prolegomena zur Geschichte Israels* (Berlin, 1882; Eng. trans., 1885; 5th German edition, 1899; first published in 1878 as *Geschichte Israels*); *Muhammed in Medina* (Berlin, 1882); *Die Komposition des Hexateuchs und der historischen Bücher des Alten Testaments* (1889, 3rd ed. 1899); *Israelitische und jüdische Geschichte* (1894, 4th ed. 1901); *Reste arabischen Heidentums* (1897); *Das arabische Reich und sein Sturz* (1902); *Skizzen und Vorarbeiten* (1884–99); and new and revised editions of F. Bleek's *Einleitung in das Alte Testament* (4–6, 1878–93). In 1906 appeared *Die christliche Religion, mit Einschluss der israelitisch-jüdischen Religion,* in collaboration with A. Jülicher, A. Harnack and others. He also did useful and interesting work as a New Testament commentator. He published *Das Evangelium Marci, übersetzt und erklärt* in 1903, *Das Evangelium Matthäi* and *Das Evangelium Lucae* in 1904, and *Einleitung in die drei ersten Evangelien* in 1905.

WELLINGBOROUGH, a town of Northamptonshire, England. Pop. (1921) 20,357.

In 948 Edred gave the church at Wellingborough to Crowland abbey, and the grant was confirmed by King Edgar in 966. The town received the grant of a market in 1201. It was formerly famed for the chalybeate springs to which it owes its name. After its almost total destruction by fire in 1738 the town was built on its present site on the hill. The church of St. Luke has Norman and Early English portions, but is mainly Decorated. The grammar-schools, founded in 1594 were endowed with the revenues of a suppressed gild. One is an old Elizabethan structure. Freeman's school was founded by John Freeman in 1711. The principal public building is the corn exchange. The town is a centre of agricultural trade; but the staple industry is in leather. Boots and shoes, especially uppers, are manufactured. Smelting, brewing and iron-founding are carried on, as well as the manufacture of steam-engines. Iron ore is raised.

WELLINGTON, ARTHUR WELLESLEY, 1ST DUKE OF (1769–1852), was the fourth son of Garrett (1735–1781) Wellesley or Wesley, 2nd baron and 1st earl of Mornington, now remembered only as a musician. He was descended from the family of Colley or Cowley, which had been settled in Ireland for two

centuries. The duke's grandfather, Richard Colley, 1st Baron Mornington (d. 1758), assumed the name of Wesley on succeeding to the estates of Garrett Wesley, a distant relative of the famous divine. In Wellington's early letters the family name is spelt Wesley; the change to Wellesley seems to have been made about 1790. Arthur (born in Ireland in 1769[1]) was sent to Eton, and subsequently to a military college at Angers. He entered the army as ensign in the 73rd Highlanders in 1787, passed rapidly through the lower ranks (in five different regiments), became major of the 33rd (now the duke of Wellington's Regt.) and purchased the lieutenant-colonelcy of that regiment in 1793 with money advanced to him by his eldest brother. But in all these changes he did little regimental duty, for he was aide-de-camp to the lord-lieutenant of Ireland for practically the whole of these years. Before reaching full age he was returned to the Irish parliament by the family borough of Trim.

His first experience of active service was in the campaign of 1794–95, when the British force under the duke of York was driven out of Holland by Pichegru. In 1796 he was sent with his regiment to India, being promoted colonel by brevet about the same time. It was thus as a commanding officer that he learnt for the first time the details of regimental duty. He mastered them thoroughly—it was to the completeness of his practical knowledge that Wellington ascribed in great part his later success. It is probable, moreover, that he at this time made a serious study of the science of war. As soon as he landed in India he began to devote fixed hours to study, giving up cards and the violin. This study was directed chiefly to the political situation of India, and when on his advice his eldest brother, Lord Mornington, afterwards Marquess Wellesley, accepted the governor-generalship of India, he became his trusted though unofficial adviser. In the war with Tippoo Sahib the 33rd was attached to the Nizam's contingent, and Colonel Wellesley commanded this division in the army of General Harris. Though his military services in this short campaign were not of a striking character, he was appointed by his brother to the supreme military and political command in Mysore, in spite of the claims of his senior, Sir David Baird.

His great faculties now for the first time found opportunity for their exercise. In the settlement and administration of the conquered territory he rapidly acquired the habits and experience of a statesman, while his military operations against Doondiah, a robber chief, were conducted with extraordinary energy and success. When pressed in Mysore, Doondiah moved into Mahratta territory, whither Wellesley followed him. Here, negotiating and bargaining with the Mahratta chiefs, Wellesley acquired a knowledge of their affairs and an influence over them such as no other Englishman possessed. Simple and honourable himself, he was shrewd and penetrating in his judgment of Orientals; and, unlike his great predecessor Clive, he rigidly adhered to the rule of good faith in his own actions, however depraved and however exasperating the conduct of those with whom he had to deal. The result of Wellesley's singular personal ascendancy among the Mahrattas came into full view when the Mahratta War broke out. In the meantime, however, his Indian career seemed likely to be sacrificed to the calls of warfare in another quarter. Wellesley was ordered with a body of troops to Egypt. But at Bombay he was attacked by fever, and prevented from going on. The troop-ship in which he was to have sailed went down with all on board.

He returned in May 1801 to Mysore, where he remained until the Mahratta War broke out. Wellesley, now a major-general, was placed in command of a division of the army charged with the task of restoring the Peshwa, overthrown by his rival, to power. Starting from Seringapatam, he crossed the frontier on March 12, 1803, and moved on Poona. The march was one unbroken success, thanks to Wellesley's forethought and sagacity in dealing with the physical conditions and his personal and diplomatic ascendancy among the chieftains of the district. A march of 600 m. was conducted without even a skirmish. The Peshwa was restored.

Sindhia and Holkar, with the raja of Berar, maintained a doubtful but threatening aspect farther north. It was uncertain whether or not a confederacy of the northern Mahrattas had been formed against the British Government. Wellesley was charged with "the general direction and control of military and political affairs in the territories of the Nizam, the Peshwa and the Mahratta states and chiefs." Armed with these powers, he required Sindhia, as a proof of good faith, to withdraw to the north of the Nerbudda. Sindhia not doing so, war was declared on Aug. 6, 1803, and Wellesley moved against the enemy. A second division was to converge from the east, but on Sept. 23 Wellesley suddenly found that the combined forces of Sindhia and the raja of Berar were close in front of him at Assaye. Weighing the dangers of delay, of retreat and of an attack with his single division of 4,500 men, supported only by 5,000 native levies of doubtful quality, Wellesley convinced himself that an immediate attack, though against greatly superior forces (30,000 horse, 10,000 European-drilled infantry and 100 well-served guns) in a strong position, was the wisest course. He threw himself upon the Mahratta host, and, carrying out a bold manoeuvre under an intense fire, ultimately gained a complete victory, though with heavy loss. In comparison with the battle of Assaye, all fighting that had hitherto taken place in India was child's play. Wellesley brought the war to a close by a second victory at Argaum on Nov. 29 and the storming of Gawilghur on Dec. 15. The treaties with Sindhia and the raja of Berar, which marked the downfall of the Mahratta power, were negotiated and signed by Wellesley—not yet 35 years old.

His ambitions now led him back to Europe, and in the spring of 1805 he quitted India. After being sent on the abortive expedition to Hanover, he was elected M.P. for Rye, in order to defend his brother in the House, and in the following year he was Irish secretary for a few months. He was then employed in the expedition against Copenhagen, in which he defeated the Danes in the action of Kjoge (Oct. 29). In 1808, however, began the war (*see* PENINSULAR WAR) in which his military renown was fully established. In April he was promoted lieutenant-general and placed in command of a division of the troops destined to operate against the French in Spain or Portugal. He landed at Mondego bay in the first week of August, moved southwards, and on the 21st won the battle of Vimeiro. In the midst of this engagement, however, Sir Harry Burrard landed, and took over the command. Burrard was in turn superseded by Sir Hew Dalrymple, and the campaign ended with the convention of Cintra, which provided for the evacuation of Portugal by the French, but gave Junot's troops a free return to France. So great was the public displeasure in England at the escape of the enemy that a court of inquiry was held. After the battle of Corunna, Wellesley, who had in the meantime resumed his duties as Irish secretary, returned to the Peninsula as chief in command. He drove the French out of Oporto, and then prepared to march against Madrid. He had the support of a Spanish army, but his movements were delayed by the neglect of the Spanish Government, and Soult was able to collect a large force for the purpose of falling upon the English line of communication. Wellesley, unconscious of Soult's presence on his flank, advanced against Madrid, and defeated his immediate opponent, King Joseph, at Talavera de la Reina (*q.v.*) on July 27–28. But within the next few days Soult's approach on the line of communication was discovered, and Wellesley, disgusted with his Spanish allies, had no choice but to withdraw into Portugal.

A peerage was conferred upon him for Talavera. He was also made marshal-general of the Portuguese army and a Spanish captain-general. But his conduct after the battle was sharply criticized in England, and its negative results were used as a weapon against the ministry. Even on the defensive, Wellington's task was exceedingly difficult. Austria having made peace, Napoleon was at liberty to throw heavy forces into the Peninsula. Wellington, foreseeing that Portugal would now be invaded by a very powerful army, began the fortification of the celebrated lines of Torres Vedras. (*See* FORTIFICATION AND SIEGECRAFT.) As summer approached Masséna moved against Portugal with 70,000 men. Wellington, unable to save Ciudad Rodrigo, retreated down the valley of the Mondego, devastating the country, and

[1] At 24 Upper Merrion Street, Dublin, or at Dungan castle, Meath, on April 29 or on May 1; but both place and date are uncertain.

pausing to inflict a check on the French at Busaco (*q.v.*). Masséna continued to press forward but was held up definitely in front of the lines. It was with the utmost difficulty that he could keep his army from starving. At length, when the country was exhausted, he fell back to Santarem. In the spring of 1811 Wellington received reinforcements and moved forward. Masséna retreated, but such were the sufferings of his army, both in the invasion and in the retreat, that the French, when they re-entered Spain, had lost 30,000 men. Public opinion in England, lately so hostile, now became confident, and Wellington, whose rewards for Talavera had been opposed in both Houses, began to be a hero.

In the meantime Soult, who was besieging Cadiz, had moved to support Masséna. But after capturing Badajoz, Soult learnt that Masséna was in retreat, and in consequence returned to the south. Wellington, freed from pressure on this side, and believing Masséna to be thoroughly disabled, considered that the time had come for an advance into Spain. The fortresses of Almeida, Ciudad Rodrigo and Badajoz barred the roads. Almeida was besieged, and Wellington was preparing to attack Badajoz when Masséna again took the field, and marched to the relief of Almeida. The battle of Fuentes d'Onoro followed, in which Wellington was only able to extricate the army from a dangerous predicament which "if Boney had been there" would have been a disaster. His attack on Badajoz and Ciudad Rodrigo failed.

Wellington had from the first seen that, whatever number of men Napoleon might send against him, it was impossible, owing to the poverty of the country, that any great mass of troops could long be held together, and that the French, used to "making war support war," would fare worse in such conditions than his own troops with their organized supply service. It was so at the end of 1811. Soult had to move southwards to live, and the English were again more than a match for the enemy in front of them. Wellington resumed the offensive early in 1812, took by storm Ciudad Rodrigo and Badajoz, although with terrible loss, and then advanced into Spain. Marmont, who had succeeded Masséna, fell back to the Douro, but there turned upon his assailant, and, by superior swiftness, threatened to cut the English off from Portugal. Wellington retreated as far as Salamanca (*q.v.*), and there extricated himself from his peril by a brilliant victory (July 22). Instead of immediately following the French, Wellington thought it wise to advance upon the Spanish capital. King Joseph retired, and the English entered Madrid in triumph. The political effect was great, but the delay gave the French northern army time to rally. "The vigorous following of a beaten enemy was not a prominent characteristic of Lord Wellington's warfare," as Napier says. Moreover, Soult, raising the siege of Cadiz, pressed towards Madrid. Wellington was compelled once more to retire into Portugal. During this retreat he announced in general orders that the demoralization and misconduct of the British army surpassed anything that he had ever witnessed. Such wholesale criticism was bitterly resented, but indeed throughout his career Wellington, cold and punctilious, never secured to himself the affections of officers and men as Marlborough or Napoleon did. He subjugated his army and gave it brilliant victories, but he inspired few disciples except the members of his own staff. For Salamanca his rewards included a marquessate.

He was now invested with the supreme command of the Spanish armies, and, after busying himself with preparations, in May 1813 the hour for his final and victorious advance arrived. The Russian disasters had compelled Napoleon to withdraw some of his best troops from the Peninsula. Against a weakened and discouraged adversary Wellington took the field with greatly increased numbers and with the utmost confidence. Position after position was evacuated by the French, until Wellington came up with the retreating enemy at Vittoria (*q.v.*), and won an overwhelming victory (June 21). Soult's combats in the Pyrenees, and the desperate resistance of St. Sebastian, prolonged the struggle through the autumn, and cost the English thousands of men. But at length the frontier was passed, and Soult forced back into his entrenched camp at Bayonne. Both armies now rested for some weeks, during which interval Wellington gained the confidence of the inhabitants by his unsparing repression of marauding, his business-like payment for supplies, and the excellent discipline which he maintained. In Feb. 1814 the advance was renewed. The Adour was crossed, and Soult was defeated at Orthes. At Toulouse, after the allies had entered Paris, but before the abdication of Napoleon had become known, the last battle of the war was fought. Peace being proclaimed, Wellington took leave of his army at Bordeaux, and returned to England, where he was created duke of Wellington.

After the Treaty of Paris (May 30) Wellington was appointed British ambassador at the French capital. During the autumn and winter of 1814 he reported the mistakes of the restored Bourbon dynasty, and warned his Government of the growing hostility to it. His insight, however, did not extend beyond the circumstances immediately before and around him, and he failed to realize that the great mass of the French nation was still with Napoleon at heart. He remained in France until Feb. 1815, when he took part in the congress of Vienna. His imperfect acquaintance with French feeling was strikingly proved in the despatch which he sent home on learning of Napoleon's escape from Elba. "He has acted," he wrote, "upon false or no information, and the king (Louis XVIII.) will destroy him without difficulty and in a short time." Almost before Wellington's unfortunate prediction could reach London, Louis had fled, and France was at Napoleon's feet. The ban of the congress, however, went out against the common enemy, and the presence of Wellington at Vienna enabled the allies at once to decide upon their plans for the campaign. To Wellington and Blücher were committed the invasion of France from the north, while the Russians and Austrians entered it from the east. But Napoleon outstripped the preparations of his adversaries, concentrated his main army on the northern frontier, and on June 14 crossed the Sambre. The four days' campaign that followed, and the crowning victory of June 18, are described in the article WATERLOO CAMPAIGN. Wellington's reward was a fresh grant of £200,000 from parliament—he had already received £500,000 for the Peninsular War, the title of prince of Waterloo and great estates from the king of Holland, and the order of the Saint-Esprit from Louis XVIII.

Not only the prestige of his victories, but the chance circumstances of the moment, now made Wellington the most influential personality in Europe. The emperors of Russia and Austria were still far away at the time of Napoleon's second abdication, and it was with Wellington that the commissioners of the provisional Government opened negotiations preliminary to the surrender of Paris. The duke well knew the peril of delaying the decision as to the Government of France. The emperor Alexander was hostile to Louis XVIII. and the Bourbons generally; the emperor Francis might have been tempted to support the cause of Napoleon's son and his own grandson, who had been proclaimed in Paris as Napoleon II.; and if the restoration of Louis—which Wellington believed would alone restore permanent peace to France and to Europe—was to be effected, the allies must be confronted on their arrival in Paris with the accomplished fact. He settled the affair in his usual downright manner, telling the commissioners bluntly that they must take back their legitimate king, and refusing—perhaps with more questionable wisdom—to allow the retention of the tricolour flag, which to him was a "symbol of rebellion."

Further, it was mainly owing to the influence of Wellington, in conjunction with Castlereagh, that France escaped the dismemberment for which the German powers clamoured, and which was advocated for a while by the majority of the British cabinet. Wellington realized the necessity, in the interests not only of France but of Europe, of maintaining the prestige of the restored monarchy, which such a dismemberment would have irretrievably damaged. In the same spirit he carried out the trust imposed upon him by the allies when they placed him in command of the international army by which France was to be occupied, under the terms of the second peace of Paris, for five years. By the terms of his commission he was empowered to act, in case of emergency, without waiting for orders; he was, moreover, to be kept informed by the French cabinet of the whole course of business. If he had no sympathy with revolutionary disturbers

of the peace, he had even less with the fatuous extravagances of the comte d'Artois and his reactionary *entourage*, and his immense powerful influence was thrown into the scale of the moderate constitutional policy of which Richelieu and Decazes were the most conspicuous exponents. Besides the complex administrative duties connected with the army of occupation his work included the reconstruction of the military frontier of the Netherlands, and the conduct of the financial negotiations with Messrs. Baring, by which the French Government was able to pay off the indemnities due from it, and thus render it possible for the powers to reduce the occupation from five years to three.

The events of the next few months considerably modified his opinions in this matter. The new chambers proved their trustworthy quality by passing the budget, and the army of occupation was reduced by 30,000 men. Wellington now pressed for the total evacuation of France, pointing out that popular irritation had grown to such a pitch that, if the occupation were to be prolonged, he must concentrate the army between the Scheldt and the Meuse, as the forces, stretched in a thin line across France, were no longer safe in the event of a popular rising. At the congress at Aix-la-Chapelle in the autumn of 1818, which settled the question, it was owing to his common-sense criticism that the proposal of Prussia, supported by the emperor Alexander and Metternich, to establish an "army of observation" at Brussels, was nipped in the bud. The definitive financial settlement between France and the allies was left entirely to him.

On Wellington's first entry into Paris he had been received with popular enthusiasm, but he had soon become intensely unpopular. He was held responsible not only for the occupation itself, but for every untoward incident to which it gave rise; even Blücher's attempt to blow up the Pont de Jéna, which he had prevented, was laid to his charge. His characteristically British temperament was wholly unsympathetic to the French, whose sensibility was irritated by his cold and slightly contemptuous justice. Two attempts were made to assassinate him. His work in Paris, however, was now finished, and on Oct. 30 he took leave of the international troops under his command. On Oct. 23, while still at Aix, he had received an offer from Lord Liverpool of the office of master-general of the ordnance, with a seat in the cabinet. He accepted, though with some reluctance.

He organized the military forces held in case of a Radical rising. It was his influence with George IV. that led to the readmittance of Canning to the cabinet after the affair of the royal divorce had been settled. It was only in 1822, however, that the tragic death of his friend Londonderry (Castlereagh) brought him once more into international prominence. Londonderry had been on the eve of starting for the conference at Vienna—later adjourned to Verona—and the instructions which he had drawn up for his own guidance were handed over by Canning, the new foreign secretary, to Wellington, whose official part at the congress is outlined elsewhere. (*See* VERONA, CONGRESS OF.) Unofficially, he pointed out to the French plenipotentiaries, arguing from Napoleon's experience, the extreme danger of an invasion of Spain, but at the same time explained, for the benefit of the duke of Angoulême, the best way to conduct a campaign in the Peninsula.

Wellington disliked Canning's aggressive attitude towards the autocratic powers, and viewed with some apprehension his determination to break with the European concert. He realized, however, that in the matter of Spain and the Spanish colonies the British Government had no choice, and in this question he was in complete harmony with Canning. This was also at first the case in respect to the policy to be pursued in the Eastern Question raised by the war of Greek independence. Both Canning and Wellington were anxious to preserve the integrity of Turkey, and therefore to prevent any isolated intervention of Russia; and Wellington seemed to Canning the most suitable instrument for the purpose of securing an arrangement between Great Britain and Russia on the Greek question, through which it was hoped to assure peace in the East. In Feb. 1826, accordingly, the duke was sent to St. Petersburg (Leningrad), ostensibly to congratulate the emperor Nicholas I. on his accession, but more especially—to use Wellington's own words—"to induce the emperor of Russia to put himself in our hands." In this object he signally failed. As a diplomatist the "Iron Duke"—whom Nicholas, writing to his brother Constantine, described as "old and broken (*cassé*)"—was no match for the "Iron Tsar." As for the Greeks, the emperor said bluntly that he took no interest in *ces messieurs*, whom he regarded as "rebels"; his own particular quarrel with Turkey was the concern of Russia alone. Under stress of the imminence of the peril, which Nicholas was at no pains to conceal, the duke was driven from concession to concession, until at last the tsar, having gained all he wanted, condescended to come to an arrangement with Great Britain on the Greek question. On April 4 was signed the Protocol of St. Petersburg, an instrument which—as events were to prove—fettered the free initiative not of Russia, but of Great Britain. (*See* TURKEY: *History;* GREECE: *History.*)

After the death of the duke of York on December 5, 1826, the post of commander-in-chief was conferred upon Wellington. His relations with Canning had, however, become increasingly strained, and when, in consequence of Lord Liverpool's illness, Canning in April 1827 was called to the head of the administration, the duke refused to serve under him. The effect of his withdrawal was momentous in its bearing upon Eastern affairs. Canning, freed from Wellington's restraint, carried his intervention on behalf of Greece a step further, and concluded the Treaty of London, whereby France, England and Russia bound themselves to put an end to the conflict in the East and to enforce the conditions of the St. Petersburg protocol upon the belligerents. Against this treaty Wellington protested, on the ground that it involved war. The battle of Navarino followed.

Canning died on Aug. 8, 1827, and was succeeded as premier by Lord Goderich. The duke was at once again offered the post of commander-in-chief, which he accepted on Aug. 17. On the fall of Lord Goderich's cabinet five months later Wellington became prime minister (Jan. 9, 1828). He had declared some time before that it would be an act of madness for him to take this post; but his sense of public duty led him to accept it when it was pressed upon him by the king. His cabinet included at first Huskisson, Palmerston and other followers of Canning. The repeal of the Test and Corporation Acts having been carried in the House of Commons in the session of 1828, Wellington, to the great disappointment of Tories like Lord Eldon, recommended the House of Lords not to offer further resistance, and the measure was accordingly carried through. In May Huskisson and Palmerston voted against the Government in the East Retford question; Huskisson resigned, and the other liberal members of the ministry followed suit. It was now hoped by the so-called Protestant party that Wellington, at the head of a more united cabinet, would offer a steady resistance to Catholic emancipation. Never were men more bitterly disappointed. The Clare election and the progress of the Catholic Association convinced both Wellington and Peel that the time had come when Catholic emancipation must be granted; and, submitting when further resistance would have led to civil war, the ministry itself brought in at the beginning of the session of 1829 a bill for the relief of the Catholics in the face of opposition from the king and from Wellington's own supporters. Wellington, who had hitherto always opposed Catholic emancipation, explained and justified his change of front in simple and impressive language. He had, however, to challenge the Earl of Winchelsea to a bloodless duel. No mischief resulted from the encounter.

As soon as Catholic emancipation was carried, the demand for parliamentary reform and extension of the franchise agitated Great Britain from end to end. The duke was ill informed as to the real spirit of the nation. He conceived the agitation for reform to be a purely fictitious one, worked up by partisans and men of disorder in their own interest. Wholly unaware of the strength of the forces which he was provoking, the duke, at the opening of the parliament which met after the death of George IV., declared against any parliamentary reform whatever. This declaration led to the immediate fall of his Government. Lord Grey, the chief of the new ministry, brought in the Reform bill, which was resisted by Wellington as long as anything was to be gained by resistance. When the creation of new peers was known

to be imminent, however, Wellington was among those who counselled the abandonment of a hopeless struggle. His opposition to reform made him for a while unpopular. He was hooted by the mob on the anniversary of Waterloo, and considered it necessary to protect the windows of Apsley House with iron shutters.

For the next two years the duke was in opposition. On the removal of Lord Althorp to the House of Lords in 1834, William IV. unexpectedly dismissed the Whig ministry and requested Wellington to form a cabinet. The duke, however, recommended that Peel should be at the head of the Government, and served under him, during the few months that his ministry lasted, as foreign secretary. On Peel's later return to power in 1841 Wellington was again in the cabinet, but without departmental office beyond that of commander-in-chief. He supported Peel in his Corn-Law legislation, and throughout all this later period of his life, whether in office or in opposition, gained the admiration of discerning men, and excited the wonder of zealots, by his habitual subordination of party spirit and party connection to whatever appeared to him the real interest of the nation. On Peel's defeat in 1846 the duke retired from active public life. He was now nearly eighty. His organization of the military force in London against the Chartists in April 1848, and his letter to Sir John Burgoyne on the defences of the country, proved that the old man had still something of his youth about him. But the general character of Wellington's last years was rather that of the old age of a great man idealized. To the unbroken splendours of his military career, to his honourable and conscientious labours as a parliamentary statesman, life unusually prolonged added an evening of impressive beauty and calm. The passions excited during the stormy epoch of the Reform Bill had long passed away. Death came to him at last in its gentlest form. He passed away on Sept. 14, 1852, and was buried under the dome of St. Paul's.

BIBLIOGRAPHY.—The *Wellington Despatches*, edited by Gurwood; *Supplementary Despatches;* and *Wellington Despatches, New Series*, edited by the second duke of Wellington. Unlike Napoleon's despatches and correspondence, everything from Wellington's pen is absolutely trustworthy: not a word is written for effect, and no fact is misrepresented. Almost all the political memoirs of the period 1830–50 contain more or less about Wellington in his later life. Those of Greville and Croker have perhaps most of interest. A good deal of information, from the unpublished Russian archives, is given in F. F. de Martens' *Recueil des traités conclus par la Russie. See* also Sir Herbert Maxwell, *Life of Wellington* (2 vols., 1900); J. W. Fortescue, *Wellington* (1925); and the literature of the Peninsular War (*q.v.*), Waterloo Campaign (*q.v.*)

WELLINGTON, a market town in the Wellington parliamentary division of Somersetshire, England, at the foot of the Blackdown hills, and near the river Tone, 151 m. W. by S. of London by the G.W. railway. Pop. of urban district (1921), 7,212. The 15th-century church of St. John has a fine Perpendicular tower and chancel; while the clerestoried nave is Early English. A tower, which stands on the highest peak of the Blackdowns, 2½ m. S., was erected in honour of the duke of Wellington.

WELLINGTON, the capital of New Zealand, the seat of government, and of a bishop. The governor-general also has his permanent residence here. Pop. (1927) 126,750. The city lies on the south-western shore of the North Island, on the inner shore of Port Nicholson, the site affording a magnificent deep harbour walled in by abrupt hills. The original flat shore has been reclaimed for a considerable distance and provides the site for the chief business part of the city, in which there are many large and imposing structures. The residential suburbs extend over the surrounding hills and terraces, and out to the seaside bays, also across the harbour to Day's Bay. In recent years the Hutt Valley has been extensively converted to this use. Two main railway lines leave the town, one to Auckland and the other to Napier. Reclamation operations to provide a site for a modern railway station for both railway systems are well advanced. The principal public buildings are governmental; the Houses of Parliament (in brick and New Zealand marble) are partially completed; the town hall is an imposing structure founded by King George V. (as duke of York) in 1901; the Victoria University College is a red brick edifice, and there are fine educational institutions. The national museum is established here. Several public parks and recreation grounds adorn the city. Wellington has ample electric tram and motor services, while its electric supply is from the Mangahao hydro-electrical head works (Government) near Shannon, 80 miles north. As a chief port Wellington vies with Auckland. The city was founded in 1840, being the first settlement of New Zealand colonists. The capital was transferred from Auckland in 1865.

WELLS, CHARLES JEREMIAH (1798?–1879), English poet, was born in London, probably in the year 1798. He was educated at Cowden Clarke's school at Edmonton, with Tom Keats, the younger brother of the poet, and with R. H. Horne. He met John Keats, but later quarrelled with him.

In 1822 he published *Stories after Nature,* and in 1823, under the pseudonym of H. L. Howard, *Joseph and his Brethren.* For the next three years Wells saw Hazlitt, as he said, "every night," but in 1827 the two men were estranged. Wells was now practising as a solicitor in London, but he went to live in the country, first in South Wales and then at Broxbourne, Herts, on account of his health. In 1840 he left England for good. He settled at Quimper, in Brittany, where he lived for some years. A story called *Claribel* appeared in 1845, and one or two slight sketches later, but several tragedies and a great deal of miscellaneous verse belonging to these years are lost. Wells stated in a letter to Horne (November 1877) that he had composed eight or ten volumes of poetry during his life, but that, having in vain attempted to find a publisher for any of them, he burned the whole mass of mss. at his wife's death in 1874. The only work he had retained was a revised form of *Joseph and his Brethren,* which was praised in 1838 by Wade, and again, with great warmth, by Horne, in his *New Spirit of the Age,* in 1844. The drama was then once more forgotten, until in 1863 it was read and vehemently praised by D. G. Rossetti. The tide turned at last; *Joseph and his Brethren* became a kind of shibboleth—a rite of initiation into the true poetic culture—but still the world at large remained indifferent. Swinburne wrote an eloquent study of it in the *Fortnightly Review* in 1875, and the drama itself was reprinted in 1876. Between 1876 and 1878 Wells added various scenes, which are in the possession of Mr. Buxton Forman, who published one of them in 1895. After leaving Quimper, Wells went to reside at Marseilles, where he held a professorial chair. He died on Feb. 17, 1879.

The famous *Joseph and his Brethren,* concerning which criticism has recovered its self-possession, is an overgrown specimen of the pseudo-Jacobean drama in verse which was popular in ultra-poetical circles between 1820 and 1830. Its merits are those of rich versification, a rather florid and voluble eloquence and a subtle trick of reserve, akin to that displayed by Webster and Cyril Tourneur in moments of impassioned dialogue.

In 1909 a reprint was published of *Joseph and his Brethren,* with Swinburne's essay, and reminiscences by T. Watts-Dunton.

WELLS, DAVID AMES (1828–1898), American economist, was born in Springfield, Mass., on June 17, 1828. He graduated at Williams college in 1847 and at the Lawrence Scientific school, becoming assistant professor, in 1851. In 1850–65 he published with George Bliss an *Annual of Scientific Discovery.* His essay on the national debt, *Our Burden and Our Strength* (1864), secured him the appointment in 1865 as chairman of the national revenue commission, which laid the basis of scientific taxation in the United States. In 1866–70 he was special commissioner of revenue and published important annual reports; during these years he became an advocate of free trade. The creation of a Federal bureau of statistics in the department of the Treasury was largely due to his influence. In 1871 he was chairman of the New York State Commission on local taxation. He did good work in the reorganization of the Erie and the Alabama and Chattanooga railroads and on the board of arbitration for railroads. In 1877 he was president of the American Social Science Association. He died in Norwich, Conn., on Nov. 5, 1898. He edited many scientific text-books, and wrote *Robinson Crusoe's Money* (1876), *Our Merchant Marine* (1882), *A Primer of Tariff Reform* (1884), *Practical Economics* (1885), *Recent Economic Changes* (1889), *The Relation of the Tariff to Wages* (1888) and *The Theory and Practice of Taxation* (1900), edited by W. C. Ford.

See the tribute by W. C. Ford in *Harper's Weekly* (vol. xlii., Nov. 19, 1898) and one in the *Journal of Political Economy* (vol. vii., Dec. 1898).

WELLS, HERBERT GEORGE (1866–), English novelist, sociologist, historian and Utopian, was born at Bromley, Kent, on Sept. 21, 1866. His father, Joseph Wells, was a professional cricketer; the young Wells had acquaintance with those straits, compromises and vicissitudes of the Victorian "lower middle class," which he was afterwards to describe, in several of his most famous novels, with such poignant sympathy and rich humour. Grants and scholarships took him to the Royal College of Science, at South Kensington; and in 1888 he graduated, with first-class honours, as B.Sc. of London University. He taught science for some years, as schoolmaster and private coach; but in 1893 turned to journalism, and in 1895 published his first book, *Select Conversations with an Uncle*, and began his astonishing career as a novelist with the short but vivid and powerful romance, *The Time Machine*. At this stage, Mr. Wells was one of the brilliant group known to the 'nineties as "Henley's young men." But already he had adopted his own line. He was to clothe scientific speculation in the form of fiction. *The Wonderful Visit* and *The Stolen Bacillus and Other Stories* appeared and in 1896 followed the grim *Island of Doctor Moreau*, and *The Wheels of Chance*. In this latter novel, Mr. Wells treats the romantic aspirations of the awkward and the shabby; and that strain was, later, developed more fully in *Love and Mr. Lewisham, Kipps* and *The History of Mr. Polly*. In 1897 came *The Plattner Story*, a collection of tales, and *The Invisible Man*—another scientific romance. In *The War of the Worlds* (1898) and *When the Sleeper Wakes* (1899) (subsequently revised, and re-published under the title *The Sleeper Awakes*, in 1911), there is again the double interest. Mr. Wells set himself to ask, not merely what might be, but what ought to be: and the enthusiasm of the reformer was manifested. *Tales of Space and Time*, a collection of short stories, appeared in 1899; and *Love and Mr. Lewisham* in 1900. In *Anticipations*, Mr. Wells presented his prophecies, as solid essays in constructive sociology. More essays followed in *Mankind in the Making* (1903). To the same period belong *The First Men in the Moon* (1901), *The Sea Lady* (1902), and *Twelve Stories and a Dream* (1903). *The Food of the Gods* (1904) is again scientific-sociologic romance: in *A Modern Utopia* (1905) the thought was summed up. The author was at this time preoccupied with the idea of an order of "Samurai," self-chosen and self-dedicated aristocrats, in some degree comparable with the Guardians in Plato's *Republic*. In this same year, 1905, came *Kipps: the Story of a Simple Soul*, a straightforward novel of contemporary life, which is still by many considered its author's masterpiece. 1906 saw *In the Days of the Comet* and *The Future in America*, as well as Mr. Wells's first incursion into active politics. He had been a member of the Fabian Society since 1903, but in 1906 came forward with criticisms of its methods. With these activities are connected *This Misery of Boots* (1907), and *Socialism and Marriage* (1908) —both Fabian tracts. In *New Worlds for Old* (1908) and *First and Last Things* (revised, 1917) Mr. Wells explained his Socialism. *The War in the Air* (1908) was a further scientific romance. *Tono-Bungay* (1909) inaugurated that series of novels in which Mr. Wells dealt with contemporary history. *Ann Veronica*, also published in 1909, dealt with the revolt of "emancipated" young women; and *The History of Mr. Polly* (1910), is a reversion to the simple, jolly, pathetic type of *Kipps*. In the series inaugurated by *Tono-Bungay* may be placed *The New Machiavelli* (1911), *Marriage* (1912), *The Passionate Friends* (1913), *The Wife of Sir Isaac Harman* (1914) and *The Research Magnificent* (1915). In 1914 appeared *An Englishman Looks at the World* and *The World Set Free*. *Bealby* (1915) seems a mere holiday from serious labours, and so does the satirical *Boon* (1915). Mr. Wells has written on the World War. In *Mr. Britling Sees it Through* (1916), he gave a picture of the "home-front." The titles of *What is Coming?* (1916) and *In the Fourth Year* (1918) speak for themselves; 1917 saw another philosophical work, *God the Invisible King*, and in the same year the author attempted to embody his philosophical ideas in fiction, with *The Soul of a Bishop*. In *Joan and Peter* (1918), three familiar strands are interwoven: history of a nation at war, destructive criticism of contemporary social method and constructive educational ideals. Various commentaries on post-war trends were: e.g., *Russia in the Shadows* (1920), *The Salvaging of Civilisation* (1921), *Washington and the Hope of Peace* (1922). Obviously, the most important post-war work by Mr. Wells is *The Outline of History* (1920). He has also written a much briefer work of the same scope—*A Short History of the World* (1922). In the general elections of 1922 and 1923 he stood unsuccessfully as Labour candidate for the University of London. *The Undying Fire* (1919), *Men Like Gods* (1923), and *The Dream* (1924), are propagandist discussion; *Christina Alberta's Father* (1925), is an indictment of the Lunacy Laws; *Meanwhile* (1927), in fiction form, gives an account of the General Strike; and *Mr. Blettsworthy on Rampole Island* (1928) uses the vagaries of abnormal psychology, and the familiar Wellsian creation of strange tribes and monsters, to produce a satire on the civilisations that lead to war. We next have the intimate and sensitive "Introduction" to a collection of stories and poems by Catherine Wells who died in 1927. *The Book of Catherine Wells* was published in 1928. Mr. Wells himself regards *The Open Conspiracy* (1928) as stating "the essential ideas of my life, the perspective of my world." Of *William Clissold*, which attempted a contemporary instead of an age-long conspectus, it was urged that the author confused fact with fiction in an illegitimate way, and expressed as his characters' opinions what were really his own.

Mr. Wells's qualities have their defects: rapidity of judgment implies impatience towards slow democratic developments, his strength of personal conviction entails impatience towards the convictions of others. But he has exercised an unquestionable influence upon his generation. (G. Go.)

WELLS, HORACE (1815–1848), American dental surgeon, was born at Hartford, Vt., Jan. 21, 1815. He studied dentistry in Boston, 1834, and began practice in Hartford, Conn. In 1840 he first expressed the idea that teeth might be extracted painlessly by the application of nitrous oxide gas. He tested the efficacy of the gas in this operation on his own person in 1844 and afterwards frequently used it in his practice. He was long thought to have been the first to use an anaesthetic in any operation, and, though it is now known that he was preceded by Dr. Crawford Long (*q.v.*), he deserves the credit of an independent discovery, which through him was first brought to the world's attention. He died in New York city Jan. 24, 1848.

WELLS, SIR THOMAS SPENCER, 1ST BART. (1818–1897), English surgeon, was born at St. Albans on Feb. 3, 1818. He was a member of Council of the Royal College of Surgeons, Hunterian professor of surgery and pathology (1878), president (1882) and Hunterian orator (1883). In 1883 he was made a baronet. He died on Jan. 31, 1897. Sir Thomas is famed for his successful and safe revival of the operation of ovariotomy, the principles of the operation now being applied to the other abdominal viscera. His chief writings are *Diseases of the Ovaries* (1865–1872), *Notebook for Cases of Ovarian and other Abdominal Tumors* (1865) and *On Ovarian and Uterine Tumors* (1882).

WELLS [*Theorodunum, Fonticuli, Tidington, Welliae, Welle*], a city of Somerset, England. Pop. (1921) 4,369. It lies below the Mendip Hills and derived its name from St. Andrew's Wells, which during the middle ages were thought to have curative properties. There was a Roman settlement on the present site. During Saxon times Wells was one of the most important towns of Wessex. King Ine founded a religious house here in 704. In 905 Wells was made the seat of a bishopric by Edward the Elder. About the year 1091–1092 Bishop John de Villula removed the see to Bath. After struggles between the secular clergy of Wells and the regulars of Bath, it was finally arranged in 1139 that the bishop should take the title of "bishop of Bath and Wells," and should in future be elected by representatives of the monks of Bath and of the canons of Wells who were secular canons of St. Augustine. Wells became a borough owned by the bishops before 1160, and in that year Bishop Robert granted the first charter. Wells was represented in parliament from 1295 to 1868.

The beautiful cathedral was executed principally by Bishops Reginald Fitz-Jocelyn (1171–1191), Savaricus (1192–1205) and Jocelyn (1206–1242). The western part of the nave, with the beautiful series of statues on the façade, is attributed to Bishop Jocelyn. With him was associated a famous architect in Elias de Derham, who was his steward in 1236, and died in 1245. The upper half of the two western towers has never been built. The central tower, 160 ft. high, was built early in the 14th century; the beautiful octagonal chapter-house on the north side, and the lady chapel at the extreme east, were the next important additions in the same century. The whole church is covered with stone groining of various dates, from the Early English of the choir to the fan vaulting of the central tower. Its plan consists of a nave (161 ft. in length and 82 in breadth) and aisles, with two short transepts, each with a western aisle and two eastern chapels. The choir and its aisles are of unusual length (103 ft.), and behind the high altar are two smaller transepts, beyond which is the very rich Decorated lady chapel, with an eastern semi-octagonal apse. On the north of the choir is the octagonal chapter-house, the vaulting of which springs from a slender central shaft. The cloister, 160 by 150 ft., extends along the whole southern wall of the nave. The extreme length of the church from east to west is 383 ft. The oak stalls and bishop's throne in the choir are magnificent examples of 15th-century woodwork.

On the south side of the cathedral stands the bishop's palace, a moated building, originally built in the form of a quadrangle by Bishop Jocelyn, and surrounded by a lofty circuit wall. The hall and chapel are beautiful structures, mostly of the 14th century.

Fine remains of the vicars' college, dating from the 15th century, and other residences of the clergy stand within and near the cathedral close; some of these are beautiful examples of mediaeval domestic architecture.

The church of St. Cuthbert has a fine tower with spire at the west end. It was originally an Early English cruciform building, but was much altered during the Perpendicular period.

Fairs were granted before 1160. But Wells is now ecclesiastical. The theological college is well known. The diocese covers all Somerset except Bedminster.

WELLSTON, a city of Ohio, U.S.A. Pop. (1920) 6,687 (98% native white). Coal and iron are mined extensively, and there are furnaces, foundries and machine shops. To the north is Lake Alma park. Wellston, founded in 1871 by Harvey Wells, was chartered in 1876.

WELLSVILLE, a city of Ohio, U.S.A. Pop. (1920) 8,849 (84% native white). The region is rich in clay, coal, oil and gas, and the manufactures include yellow and white pottery, sewer pipe, terra cotta, sheet iron, iron castings and machinery. In 1795 James Clark, of Washington county, Pa., bought a tract of 304 acres here, transferring it to his son-in-law, William Wells, after whom the town was named. It was chartered as a city in 1890.

WELSH LANGUAGE AND LITERATURE. Welsh is the Celtic language of Wales. Old Welsh (800–1100), is known to us almost entirely by means of isolated words or glosses. The term "*cymro*" or "fellow-countryman" dates from the 7th century. It has been therefore impossible to record the phonetic system or the grammatical structure of the oldest forms in any detail. The Middle Welsh period (1100–1500) is better known through a greater supply of valuable material. The symbol *ll* to denote a voiceless *l* appears in middle Welsh. But *rh* (voiceless r) *dd* (= Eng. *th* in "thou") and f = v become regular in the modern period. As compared with Old Irish the inflectional system has become simple. There are only faint traces of case forms, the dual and the neuter gender. The infixation of pronominal objects, between the verbal participle and the verb itself continues in use to the present day. Four dialectical groups are known, two Northern—(Powys and Gwynedd), spoken in Anglesea, Carmarthen and Merioneth, and two Southern, (Dyfed and Gwent), spoken in Cardigan, Carnarvon and Glamorgan.

WELSH LITERATURE

The earliest literature of the Cymry is preserved in about half a dozen mss., written, with one exception, after the close of the 12th century. The most important of these, the so-called *Four Ancient Books of Wales*[1], are anthologies or collections of pieces both traditional and contemporary.

Up to the end of the 6th century, before Northumbrian and Mercian aggression had confined the Welsh nation to its present boundaries, the whole of the district west of a line drawn roughly from the Firth of Forth to the mouth of the Exe was still Celtic territory, and, with the exception of certain districts to be described later, spoke the British tongue, from which Welsh has developed, just as Italian has developed from Latin.

Traditional Literature, 550–1150.—It is now generally agreed that up to the 7th century the dominant language in Gwynedd and Dyved (the north-western and south-western corners of Wales) was Irish. These Irish districts were the homes of the most important portion of the early prose literature, which, in all its variety, is known as the *Mabinogion*. Still stronger proof of the Goedelic origin of the early romances is to be found in the correspondence between the characters and incidents of the *Mabinogion* and those of the tales of Ireland, more particularly of the earlier cycle known as the Ultonian.

The northern portion of this ancient Wales, comprising roughly the districts included between the Wirral peninsula and the Clyde valley, was called in Welsh *Y Gogledd*, or the North. In many respects the literature emanating from this region is the best authenticated of all the cycles, because the poets of this region describe themselves and their heroes as *Gwŷr y Gogledd*, "the men of the North." This poetry represents the original Celtic tradition in literature, and therefore unites Welsh literature to the indigenous literature of all Aryan nations. The names of two poets are connected with this cycle, *Taliesin* and *Aneirin*, and it is unified into one cycle by the fact that we have here a school of poetry based on a genuine and historical tradition; that is to say, all the poems contained in it are concerned with historical heroes who actually lived in *Y Gogledd* about the 6th century, and not with the myths of the early gods for which we must look to the *Mabinogion* in the Western Cycle. This manner of song persisted in Wales in its greatest vigour under the princes of Gwynedd, whose court was at Aberffraw in Anglesey, and afterwards, after the loss of Welsh independence in 1282, in the houses of the *uchelwyr*, the aristocracy. It underwent a great quickening under the influence of France in the 14th century and, after many vicissitudes, still flourishes in our day in what is known as the *Mesurau Caethion*—"Un-free Metres." Its preservation, as we shall presently see, was mostly due to Gronwy Owen (1723–69) in the 18th century, and to Sir John Morris-Jones in our own day. Thus have the primitive modes of the Aryan heroic poetry descended to us in the 20th century in a manner which is probably unparalleled in any other country.

The eastern and central portion of ancient Wales comprised the country of the ancient Ordovices. This corner of Wales, which came afterwards to be called *Powys*, or the "Settlement," had as its chief town the ancient Pengwern, not far from the modern Shrewsbury. It is probable that Powys had been profoundly affected by Roman influences, which are reflected in its characteristic literature. The product of this district was the early *englyn*, a form of epigrammatic verse unknown in the heroic poetry of the North, and which, if the present writer, following Sir John Rhys, is right[2], was developed directly from the Latin

[1] They are *The Book of Aneirin*, *c.* 1250, *The Black Book of Carmarthen*, *c.* 1170–1230, *The Book of Taliessin*, *c.* 1275, and *The Red Book of Hergest*, *c.* 1375–1425. All four have been copied and printed by Dr. Gwenogvryn Evans.

[2] Sir John Morris-Jones in his *Cerdd Dafod*, maintains that the hexameter and the *englyn* are independent developments of the same Aryan form.

elegiac couplet, as recorded on British tombstones. These early *englynion*, some of which have been preserved in the oldest ms. of Welsh poetry (the *Juvencus* ms. at Cambridge), were assigned by tradition to Llywarch Hen, and it is probable that the bulk of them, in their original form, is the work of a poet of that name flourishing in the 6th or 7th century. Whether they have any direct connection with the Latin hexameter or not, they have marked characteristics which separate them from the more primitive poetry of *Y Gogledd*. This song of the East is, comparatively speaking, sophisticated and literary; it is elegiac and reflective in tone, and is almost exclusively a lament for dead friends or the glory that is no more. In form, it is marked with great reserve and bleakness.

That tract of Celtic territory which is roughly included in the modern counties of Cornwall and Devon, the home of the ancient Dumnonii, seems to have been left alone by the Romans. By the triumph of the West Saxons at the battle of Deorham in 577, the Britons of this district were, with their kinsmen of Somerset and Gloucester, completely cut off from the rest of Wales. In the extreme west of their land, however, *i.e.*, in Cornwall, they still spoke the British tongue well into the 18th century, though they made no direct contribution to Welsh literature. But they had a share in the material of literature, which, in its effect upon the world, is of greater importance than all the rest; for to them must be given the credit of cradling the legend of Arthur. The earliest Welsh literature knows little or nothing of Arthur.

The Northern Cycle.—In the additions to the work of the historian Nennius, dating from about the 9th century, we are told that in the time of Ida son of Eobba (reigned A.D. 549–559), five poets sang in the British tongue, Talhaearn Father of Song, Neirin, Taliessin, Bluchbard and Cian. Of the first and the last two we know nothing, but a large amount of poetry purporting to be the work of Neirin, or as he is generally known Aneirin, and of Taliessin has been preserved. Much controversy has raged around these names, but we here accept the conclusions of Sir John Morris-Jones, that a large portion of the verse assigned to Aneirin and Taliessin was actually sung in the 6th century. Aneirin is the reputed author of the *Gododdin*, but it is clear that what we possess to-day is a much later version of the original poem with additions by later hands. The *Gododdin* belongs to the Celtic and Aryan Heroic Age, which had probably come to an end by the close of the 6th century. But imitations of the manner and substance of the Heroic Poetry persisted for almost 800 years, that is to say, throughout the whole period of those bards known as the *Gogynfeirdd*, or the post-primitive bards. All the heroic poetry of the Aryan nations was probably sung or recited when the heroes whom it celebrated were still in the flesh, and it is likely that the original poet of the *Gododdin* described scenes which he had himself witnessed and heroes with whom he had caroused in the mead-hall. Aneirin's poem describes the warriors, mostly men of the *Gododdin*, who went to battle at Catraeth against the Angles of Bernicia and Deira. We know from ancient geographers that the Gododdin (Votadini) were a tribe in the south-east of Scotland, and it is generally agreed that Catraeth was situated at Catterick in Yorkshire. The *Gododdin* does not describe the battle itself, but rather the heroes who went to it. A note of melancholy underlies the whole of the poem, though it is concerned with two events that are prominent in all heroic poetry—the carousal and the fight. But what marks the *Gododdin* as different from most heroic poems is that it tells of heroes who fought and lost; its champions go singing to battle, but after that, silence. Other heroes merrily drink the mead, and slay their enemies in their great joy; here the heroes drink, and their foes exult over the fallen drunkards.

The poetry of Taliessin is more varied, and somewhat more primitive in character. Of the mixed collection attributed to him, we may safely assume that most of the poems dealing with Urien and his son Owein, lords of Rheged in the North,—the Uryence and Yvain of Arthurian Romance—are genuine and contemporary with the heroes whom they celebrate. Here we have no flowers of rhetoric, none of the craftily worded hyperbole of praise, which is the certain mark of later practitioners of the bardic art of the Northern Cycle. The diction is simple.

In addition to the historical poems, there are some songs of Taliessin that deal with the early myths of the Welsh, and it is probable that these are by a later hand.

The Eastern Cycle.—The earliest poetry in this cycle is probably not much later than the genuine work of Aneirin and Taliessin. It is written in stanzas of three or four lines called *englyn* (pl. *englynion*), and is important as the probable channel by which those outside influences travelled which quickened the conventional court poetry of the North. The first examples, traditionally the work of Llywarch Hen, describe the desolation and waste that followed in the train of the Mercians who had sacked the court of Cynddylan at Pengwern. One very special characteristic marks all this *englyn* poetry,—the poet is always in solitude, and whether he meditates on the unhappy things of old or the desolation of the present or on external nature, he treats all his themes from the same point of view. Is the theme war?—then the poet is the sole survivor of his lord's retinue and his own family of gallant sons. Is it religion?—then he is an anchorite in the wilderness, stilling the weary restlessness of his heart with the sight of a bleak and unfriendly nature. He always stands in the *anghenedl*, in the desolate no-man's land, and turns to the only consolation which is left to him, now that he has no longer the merry candle-lit mead-hall and the society of his fellows. He turns to nature, not as Wordsworth did to seek a mystical union, but objectively to find a new interest, and an analogy to his own bleak condition. Thus was developed a new kind of verse which is divided into well-marked stages, first the desolation of a ravaged country side; then the plaints of a lonely old age; then the reflections of a hermit who describes, rather than interprets, the sights and sounds of nature; then the longing of the lover who unifies all beauty in the crucible of his own imagination; and finally, in the poet-princes of the Gogynfeirdd period, we find a new element, the love of country and one's own people, though the verse is no longer in *englyn* form. This attitude towards nature persisted throughout the whole history of Welsh poetry, and is nowhere more deeply marked than in the Snowdon poets of the 19th century, Ieuan Glan Geirionydd and Glasynys. The earliest of these *englynion* contained in the *Juvencus* ms., are simple, and as yet contain no hint of a consciousness of external nature. Later this kind of poetry degenerated into a conventional gnomic verse which utilized well-known forms, as in *The Hall of Cynddylan*, to introduce a proverb at the end of each stanza. Closely connected with this poetical *genre* are the *Verses of the Graves*, in which some unknown poet lets his fancy wander over the whole of Wales, and describes the places where the warriors of old are buried.

The Western Cycle.—In the extreme Western portions of Wales (*i.e.*, Anglesey with the opposite coast of Arvon, and the peninsula of Lleyn which still bears its Irish name of "the land of the Leinster men," and Dyved) the old Irish civilization died hard. Here grew up the legends which were utilized by some one to form the *Mabinogion*, that choicest flower of the Welsh genius. It is likely, however, that the impulse which caused their final reduction to writing came from outside. It was when the Norman, in the early part of the 12th, or even perhaps in the 11th century, began to reproduce in his own tongue the marvellous stories of Britain, that Welshmen began to realize the value of their own traditions. Welsh writers treated those traditions in many different ways. (1) They reduced to writing the *cyvarwyddyd*, the spoken tale which formed the stock-in-trade of the lower orders of the wandering bards; this became what is called the *Four Branches*, the *Mabinogion* proper, namely, *Pwyll, Branwen, Manawydan* and *Math*. (2) They translated into Welsh the stories which had already been put together in France from Welsh material, and thus we have *Peredur*, the *Lady of the Fountain*, and *Geraint*. These tales were not all treated alike; to *Peredur* much was added from independent Welsh sources, to *The Lady of the Fountain* a little less, and to *Geraint* hardly any at all. (3) They took an old Arthurian folk-tale of south-west Wales, added to it material from other sources, much of it Irish in origin, and produced the charming jumble known as *Culhwch and Olwen*. (4)

British tradition, as distinguished from the British-Irish material found in the *Mabinogion* proper, had already supplied Geoffrey of Monmouth with the basis of his great work the *Gesta Regum;* some of this was now re-hashed and mixed with traditions not known to Geoffrey and became the two stories of the *Dream of Macsen* and *Lludd and Llevelys.* (5) Some time after 1160, when the Arthurian stories had been already disseminated all over Europe, a purely "literary" *cyvarwyddyd* was composed, an independent tale imagined for the first time by the author on the model of other Arthurian romances, and this was named the *Dream of Rhonabwry.*

The *Mabinogion,* dated about A.D. 1100 was by no means the beginning of Welsh prose, but it was the first attempt to utilize prose for purely artistic purposes. The *Laws of the Hywel Dda* in the 10th century, shows that Welsh prose had been for centuries used as the vehicle for legal documents. The contrast between the *Mabinogion* with their directness, their restraint, their disciplined selection, and the French Arthurian romances, with their extreme sophistication is to be noted. Though the *Mabinogion* are a mass of irrelevances, though they would be laughed at by a school-boy writing a story as a task, yet they are immortal.

The Gogynfeirdd, 1150–1350.—During the dark ages of Welsh poetry, that is to say, between the 6th and the 12th centuries, little poetry was produced, or at least preserved. It is true that here and there in the "Four Ancient Books" are found poems which belong to this period; they are for the most part religious, composed probably not by the regular bards, but by the inmates of the monastic institutions where the mss. were copied. Others, again, such as the fragment, in the Black Book, of a lost *Trystan and Esyllt* poem, lead us to suppose that we have preserved for us only minute fragments of a large corpus of literature dealing with such legends as underlie the *Mabinogion* and the romances.

With the consolidation of the principality of Gwynedd under Gruffudd ap Cynan (1054–1137) and his descendants, a new song suddenly appears in that province. It is as if a new hope had informed the activities of the bards, and the first notes tell of spring and renewed vigour. It is certain, however, that the poems of the first bards of this period are the culmination of long ages of literary activity of which there is now no record. Critics of the last century tried to account for this sudden change by attributing it to the influence of Ireland, seeing that Gruffudd ap Cynan of Gwynedd was half an Irishman and had spent his youth in Ireland, and that his contemporary Rhys ab Tewdwr, king of south Wales (d. 1093), was thought to have been an exile in Ireland. There are undoubted traces of Irish influence on the works of the bards, and especially on music, but as far as poetry is concerned it can be explained by the fact that Anglesey, where the court of Gwynedd was situated, had always been the stronghold of the Irish in Wales. The court poetry of the *Gogynfeirdd* was the direct and inevitable development of the work of the primitive poets (*Cynfeirdd*) of the Northern Cycle. It was in Gwynedd that this ancient heritage found its home, and it is in Gwynedd that the classical tradition flourishes to this day. Thus we may say that modern poetry in the 'unfree metres' represents the unbroken tradition of the Northern Cycle modified and augmented by the contribution of Powys, the Eastern Cycle.

The Bardic System.—The organization and position of the bards of this period in the social and political life of the country seem to be peculiar to the Celtic peoples. They were divided into grades, the upper grade or *Pencerdd* ("chief of song") being a high officer of the court, whose duty it was to sing the praises of his lord and his family, and of God and the saints. He was forbidden to sing of love and nature, and his field of song was mapped out and prescribed. He was not only the bard of the court, but was a kind of metropolitan of poetry for the whole province; under him came the *Bardd Teulu* (the bard of the king's guards) who did for the king's household what the *Pencerdd* did for the king himself. He also was restricted as to subject, but he might sing of love and nature, and such songs as would please the ladies but be distasteful to the virile warrior kings. Last of all came many kinds of *Cerddorion* (musicians) who might be permitted ribaldry and satire, and who told the *cyvarwyddyd* or tale which was eventually written as *Mabinogion.* They might be conjurors and court entertainers, and even jesters, but they were forbidden to use the metres or the subjects of the higher orders. Across this classification, which is somewhat analogous to a similar division in Ireland, cuts another, based on an entirely different principle,—the grading of the bards according to degrees of proficiency. This classification was educational, and lay at the root of all learning in Wales. There is reason to believe that these two classifications had widely different origins. The former was probably inherent in the tribal system of the Celtic conquerors of Wales; the latter was of religious origin, and grew out of the druidic system. It was this latter classification which remained in Wales after the loss of its independence; its essential feature, the relation of disciple and teacher, has persisted almost to our day. In the time of Henry IV. it led to the holding of an eisteddfod, or session of the bards, to confer certificates of proficiency, and to prevent the lower orders from flooding the country and drifting into mere mendicancy. The modern "National Eisteddfod" is a development of the end of last century, which goes back to small eisteddfodau held by learned societies at the end of the 18th century. It was at the end of the 18th century, too, that the "Gorsedd of the Bards" was devised.

One of the natural results of a bardic system of this type was an unparalleled conservatism in literature. Most of the 13th century bards, presently to be discussed, use a conventional diction which was consciously archaic, not only in its vocabulary, but even in its grammar and idiom. It could not possibly be understood by any but those classes whose education had included the study of poetry; indeed it is doubtful whether the princes to whom this poetry was addressed, and who spoke a language not widely different from our modern Welsh, could understand these Gogynfeirdd any better than we can to-day. This archaicism was one of the means by which they produced that "exquisiteness," the aim of all bardism, and non-Celtic critics often find it extremely hard to appreciate an artistry the methods of which differ so widely from those of their own.

Bardism often went by families, and the first names of the new period are those of Meilir, his son Gwalchmai, and his grandson Meilir ap Gwalchmai, who were attached to the court of Gwynedd at Aberffraw. Gwalchmai (*fl.* 1150–90) has left on record his *Gorhoffedd* or "Boasting," a spring-song typical of much that was contemporary in Ireland. Unfortunately the text is extremely defective, and we can only pick out the meaning of the poem here and there. In his *Praise of Owein,* he displays one characteristic of all the *Gogynfeirdd,* description of water, whether of river or sea. Nearly all the great poets of this period get their finest effects when they picture the waves red with the blood of their enemies. The traditional master of the archaic was Cynddelw (*fl.* 1150–1200), the court bard of the prince of Powys.

The official bards of this period all used the same material and used it in the same way. Song and its modes were prescribed for them, and to go beyond the stated limits was to be un-bardic. In the 19th century, Islwyn in his greatest poem cried that the muse should have "eternity for its path"; it was the cry of the great revolt against the conventions that have often clogged all thought in Welsh poetry. But then, the poetry of the bardic tradition was not measured by the depth and extension of its thought, but by its exquisiteness; its value was ornamental, and to be in a position to judge Cynddelw and his contemporaries, one must think of a culture that sought not to interpret life but to adorn it. Now and then would burst into song a prince of the royal house, who was not of the order of the bards, but who sang because God had set a song in his heart and on his lips. Two such princes, Owein Cyfeiliog of Powys (d. 1197) and Hywel ab Owein of Gwynedd (d. 1170), stand out in clear distinction from the contemporary bards. Owein Cyfeiliog's most famous work is the *Hirlas* (The Long Grey Drinking Horn), in which he describes his warriors making merry over the mead after a victorious fight. Hywel ab Owein, soldier, lover and patriot, was killed with his foster-brothers fighting against his own kin at the battle of Pentraeth in Anglesey in 1170. His departure from convention is even more striking than that of Cyfeiliog; for the first time in Welsh litera-

ture we get the love of country, its scenery, its people, and its language, extolled as objects worthy of song. Hywel loved beauty, in the modern sense; that is to say, he found that land and sea and women and the Welsh speech spoken in cultured accents by his lady, all awoke in him the emotion of awe and wonder, and he unifies in his own experience all these beautiful things; they depend one upon the other; they are not merely beautiful for their own sakes, they are part of a universal beauty. He thus strikes what seems to us, satiated with the bardic praises and battle songs, a very "modern" note. The Gogynfeirdd alternate throughout this period between *marwnad* (praise of the dead) and *moliant* (praise of the living) till the time when the English conquest of Wales removed from Welsh life the occasion of both. The period ends with the most famous of all the Welsh *marwnadau* sung by Gruffudd ap yr Ynad Coch, after the death of Llywelyn the last prince of Wales.

The Later Gogynfeirdd.—With the princes and their pageantry, there passed away the older modes and conventions of Welsh poetry. For the next 100 years, that is to say, from about 1280 to 1380, a new kind of poetry held the field. The audience that could once accept and understand the intricate and involved *awdl* of the old period could no longer find the means to educate themselves for the understanding of it. The old metres still remained, but the language became simpler. The poetical conventions which governed the old poetry having been thus in part relinquished, it was necessary to invent a new presentation of poetry, which contained some element that could be regarded as a substitute for them. The poets who sang in the years between the English Conquest (1282) and Dafydd ap Gwilym seem either to have returned to an earlier poetic fashion or to have been greatly influenced by new ideas from Ireland. The probability is that both suppositions are true, that is to say, that the poets of the *bardd teulu* class, whose work has not been preserved, were greatly influenced in the 11th century by the poetry of Ireland, but that this influence did not penetrate into the work of the *penceirddiaid* until the loss of Welsh independence had made them more directly dependent on what (to use an anachronism) might be called middle-class opinion.

Whereas in the early period "exquisiteness" was sought in archaic precision and in the suggestion of older modes, the new poets employed colour and form to an extent hitherto unknown in Welsh poetry, and unparalleled in later times. Dress, jewels, armour, are described in such a way as to convey to the mind of the modern reader exactly the same suggestion as he gets from the old Irish jewels, such as the Tara brooch. In the same way a lady's hair and cheeks, her form and gestures, even her silences are amply and precisely described in poetic words. The famous names in this period are those of Gruffudd ap Maredudd, Gruffudd ap Davydd, and Casnodyn, who all flourished in the first half of the 14th century.

The Golden Age of the Cywydd, 1350–1450.—The conquest of Wales by Edward I. did not put an end to the poetry associated with the royal courts of Gwynedd and Powys. Its effect was to transfer its patronage from the princes to the smaller land-owners, and to diminish the prestige which it enjoyed in Wales. Henceforth there was to be no legal recognition of the *pencerdd* and his particular department of song at the expense of the *bardd teulu*; all the political changes in Wales served to diminish the prestige of the bards who had been associated with the native princes, and to give an opportunity to the lower orders whose work had not hitherto been regarded as meriting preservation by the coypists. Indeed, in south Wales, where the Normans had been established for a whole century before the conquest of Gwynedd in 1282, the old song had probably died out, and the lower orders in the South had thus had an earlier opportunity of becoming vocal. While Gruffudd ap Maredudd and Casnodyn in Gwynedd were still, though in a simpler form, following the old conventions of the *gwawd*, the *pencerdd's* song, the unknown bards of south Wales were developing an entirely new literature of which we have no trace in the mss. before the work of Davydd ap Gwilym, who like his contemporary Chaucer in England, may be regarded, in his own land, as the father of modern poetry.

Davydd ap Gwilym.—Davydd ap Gwilym was probably born about 1320. His family are associated with Dyved, but he seems to have spent most of his time at the home of his patron Ivor Hael in Morgannwg.

In the first of his periods he wrote according to two entirely distinct traditions. His *awdlau* to his patrons, his uncle Llywelyn and Ivor Hael, follow the strictest conventions of the later Gogynfeirdd; he sang these as a *penderdd*. At the same time, he produced a large body of poetry in what must be regarded as the tradition of the *bardd teulu*. These are *cywyddau* and *traethodlau*. The *cywyddau* are in couplets of seven syllables, one rhyme being accented and the other unaccented; in this first period they are not regularly in *cynghanedd* (alliteration) as the rules of the *pencerdd's* song demanded. His other form, the *traethodl*, is also in couplets of seven syllables, but both rhymes are unaccented and there is no *cynghanedd* at all. From the fact that his *cywyddau* are the earliest known, and that his name was always associated with the *cywydd* by his contemporaries, he has come to be regarded as the inventor of the *cywydd*. There is, however, ample reason to suppose that Davydd's work was only the culmination of a long process of development among the *beirdd teulu* in south Wales who, both politically and socially, had been for a century cut off from the main tradition of Welsh poetry.

His important advance was in diction. Up to this time, poetry was written in a conventional and deliberately archaic language. Davydd ap Gwilym, in his *cywyddau*, discarded altogether the old archaisms, and wrote in the ordinary language of the educated Welshmen of his own time. His successors followed his lead, and the old diction was discarded for ever. He thus established the standards of modern Welsh.

The substance also of his poetry was new. Up to his time, the bards were confined by regulation to a few well-defined subjects, and the poetic art had now degenerated into a kind of jugglery with *clichés*. Davydd however had listened to the songs which were then delighting the ordinary educated man in Europe, and he reproduced them in his *cywyddau*. Much has of late been written about his sources, and the question is not yet settled. But we can trace the chief influences on his work, namely the song of the *clerici vagantes*, the wandering minstrels, and of the trouvères of France. His own county Glamorgan had a bilingual aristocracy speaking both Welsh and French, and was thus especially open to outside influence. The conventional divisions into which the poetry of the troubadours and trouvères is divided, *aubade, serenade, tenson, pastourelle*, and so on, are faithfully and minutely reproduced in his work. Besides this, a large part of his poetry is derived from the popular songs of wandering minstrels in Latin, French, and probably in English; in other words, whatever had become the theme of song in the Europe of the 14th century was introduced by Davydd into his *cywydd*. He has, without much discrimination, been hailed as the greatest of love poets, but this is certainly to misunderstand his work. Of love poetry, as such, he has very little; love is a peg on which he hangs his exquisite nature poems, and it is in these that we must find his greatest contribution to the poet's interpretation of life. In his nature poems he made use of two conventions, the foreign convention of the *llatai* or love-messenger, and the purely native tradition of the *dyvaliad* or descriptive poem. The first part of the poem is generally a conventional statement of his love for a lady, the second a short address to a bird, or a fish, or a natural feature, such as the cloud or the wave, praying it to take a message to the lady; the third and main portion is a minute description of the messenger. Davydd has been called the "Wordsworth of Wales," but there is no comparison between him and Wordsworth as nature-poets. To Davydd, nature is purely external, it has no mystical significance. But his treatment of it, curiously like that of his countryman W. H. Davies, invests it with a new wonder and significance.

Davydd ap Gwilym's Contemporaries.—Davydd's influence was twofold; not only was the *cywydd* established as the leading form, but the new subjects came to be recognized as themes fit for poetry. One of his oldest contemporaries, Gruffudd ab Adda (*fl.* 1350), wrote a *cywydd* "to a birch-tree that had been

made into a maypole at Llanidloes," which goes much further than Davydd in the direction of the modern conception of nature. It has now been proved that Iolo Goch (*c.* 1320–1400) was not Owen Glyndŵr's family bard, and that most of the poems to Glyndŵr popularly attributed to him were written neither to Glyndŵr nor by Iolo Goch. His greatest work is a *cywydd* to the Llafurwr (Husbandman) which shows traces of contemporary English ideas as seen, for instance, in *Piers Plowman.* Llywelyn Goch amheurug Hen (*fl.* 1360–1400) wrote some of his earlier poems in the Gogynfeirdd tradition, but his *Elegy to Llencu Llwyd,* his best-known work, is a *cywydd* and combines with striking success the Welsh tradition of the elegy with the imported form of the serenade. Other poets almost contemporary with Davydd were Gruffudd Llwyd ap Davydd (*fl.* 1380–1410), who sang two superb *cywyddau* to Owen Glyndŵr, and Rhys Goch Eryri (*c.* 1365–1448) who is chiefly famous for his literary quarrel on the nature of true poetry with Siôn Cent and Llywelyn ap y Moel, the author of a *cywydd* which gives a spirited description of one of Glyndŵr's battles. The most elusive figure in this period is Siôn Cent, to whom are attributed a large number of *cywyddau brud* or semi-political songs, and *cywyddau'r byd,* similar in every respect to the poems *du temps jadis,* so popular in every country in Europe at the beginning of the 14th century, and exemplified in the works of Villon, Dunbar, Menot and Manrique. It is probable that these poems are by many hands, but the dominant thought of them all is so characteristic that it is found convenient to refer them to the traditional name of Siôn Cent.

Davydd ap Gwilym's Successors.—With the dawn of the 14th century the *cywydd* enters a new period. The poets purified the *cywydd* from the last traces of the old convention.

Davydd Nanmor (*c.* 1435–95) in treatment of his subject and in imagination is inferior to most of Davydd ap Gwilym's contemporaries, but in his mastery of the *cywydd* form he has no equal. His poem to "Llio's Hair" and his "Maiden's Elegy," among others, mark the zenith of that conception of poetic art which aimed at simplicity. Lewis Glyn Cothi (*fl.* 1450–85) and Guto'r Glyn (*fl.* 1433–69) show a further advance in the handling of the *cywydd* metre. In their work we detect for the first time a real consciousness of nationhood among the Welsh. Other poets of this period were Maredudd ap Rhys (*fl.* 1430–50), Hywel Swrdwal (*fl.* 1460), Tudur Penllyn (*fl.* 1470) and Davydd Llwyd ap Llywelyn (*fl.* 1447–86).

The Silver Age of the Cywydd, 1450–1650.—For a short time there arose a school of literary formalists. The chief of this school was Davydd ab Edmwnd (*c.* 1425–1500), who at the Eisteddfod of the Bards held at Caermarthen in 1451 rearranged the 24 recognized metres. His poetry, apart from its great ingenuity, has little significance. His poetic heir was his nephew Tudur Aled (d. 1526) who made a further rearrangement of the rules of poetry, and whose poems, in execution, mark the very zenith of the bard's craft as conceived in that age. Unfortunately he reintroduced the *trychiad* and the *geiriau llanw* in their worst form, and his work, as a whole, marks a reaction towards the poetry of Iolo Goch and other poets of Davydd ap Gwilym's period. His contemporary Gutun Owain, though too much of his *moliant* consists of intolerable genealogical details, could, in his *dyvaliadau,* rival even Davydd ap Gwilym in his description of nature.

In the latter part of this period, two events of supreme importance occurred—the Protestant Reformation and the accession of the Tudors. The former had little immediate influence on literature, except indirectly through its effect upon the language, since, with the decline of the old Catholic educational system, the general appreciation of literature was diminished. The Tudor policy of encouraging the spread of English at the expense of Welsh, and of inducing the Welsh aristocracy to emigrate to England, almost destroyed the old Welsh culture which was altogether bound up with the language. Yet for more than a century after Henry VII. the bards plied their craft, though patronage was much diminished. Siôn Tudor (*c.* 1520–1602) satirized the new aristocracy of profiteers. Edmwnd Prys (1541–1623), archdeacon of Meirioneth, is best known for his "contention" with William Cynwal, and for his biting satire on contemporary manners; William Llŷn (1535–80) and Siôn Phylip (*c.* 1543–1620) are among the great poets of the Silver Age of the *cywydd.*

The Rise of Modern Prose.—One of the most striking features of Welsh literature is the almost entire absence of prose between 1300 and 1550. The two political movements during this period, the revolt of Glyndŵr and the accession of Henry VII. had sufficient of romance in them to repel the historian and to capture the poet. What prose the nation required it found in the tales of romance, in the legends of Arthur, of the Grail, and of Charlemagne. The little prose that was produced consisted of exercises in extravaganza called *Araith,* similar to the *Rithairec* of Ireland.

The first Welsh book, *Yn y Lhyvyr hwn,* published in 1546, consisted of extracts in Welsh from the Scriptures and the prayer book. Probably in the same year was published William Salesbury's *Oll Synnwyr Pen,* a collection of proverbs. From now on Welsh prose literature begins to take definite form, and may be studied under four headings: (1) The Reformation (2) The Counter-Reformation (3) The Welsh Renaissance (4) Puritanism.

The Reformation.—The most important name among this group of writers is that of William Salesbury (*c.* 1520–95) who devoted a long life to supply what he considered the means of salvation for the Welsh people, namely the Scriptures in Welsh and the ability to read and understand those Scriptures. His work, begun in 1546, culminated in his translation of the New Testament published in 1567. This work was largely experimental, as Welsh prose had not hitherto been used to express abstract ideas. If we consider accuracy of idiom and fidelity to the original, Salesbury's Testament must be called a great pioneer work. Unfortunately it is marred by his philological foibles and the mechanical means which he employed to make the language intelligible in every part of Wales. In the same year, 1567, was published the Welsh prayer book, translated by Richard Davies, bishop of St. David's (1501–81). In 1588 was published the Welsh Bible translated by William Morgan, bishop of St. Asaph (1541–1604), aided by Edmwnd Prys. This translation revised and amended by Richard Parry, bishop of St. Asaph (1560–1623), and John Davies (1570–1644) was republished in 1620, and that is the version which is used to this day. It would be difficult to exaggerate the importance of these three translations, the Testament of 1567 and the Bible of 1588 and 1620, in the development of Welsh literature. The translators were in a sense forming a new prose language, and for their material used the standard language of the bards as stabilized by Davydd ap Gwilym. Their success was at once obvious because from 1588 onwards there has been no break in the production of Welsh prose books. The first of these were naturally translations from English and Latin written with the purpose of grounding the Welsh nation in the principles of the Reformation. The following are some of the most important books under this heading: *Deffyniad y Ffydd* (1595), a translation of Bishop Jewel's *Apologia,* by Morys Kyffin (*c.* 1555–98); *Perl Mewn Adfyd* (1595), a translation of Coverdale's *A Spiritual and most Precious Pearl,* by Huw Lewys (1562–1634); *Homiliau* (1606), a translation of the *Homilies,* by Edward James (1570–1610); *Llwyhr Hyffordd* (1630), a translation of Dent's *Plain Pathway,* by Robert Llwyd (1565–*c.* 1650); *Yr Ymarfer o Ddduwioldeb* (1630), a translation of Bayly's *Practice of Piety,* by Rowland Vychan (*c.* 1590–1667); *Llyfr y Resolution* (1632), a translation of Parson's *Christian Directory,* by Dr. John Davies of Mallwyd (*c.* 1570–1644). To these must be added a work which was never published, the *History* of Ellis Gruffydd (b. *c.* 1500). This document is now at the National Library. It sheds much light on the life of the court and the army.

The Counter-Reformation.—During the years in which the reformed religion was being established in Wales, Welsh society and the Welsh language were at their lowest ebb. Rome had left Wales without spiritual guidance, and the principles of the Reformation had not taken hold.

Every book during this period bewails the general ignorance. It is probable that it was during this period that the Welsh language came nearest to extinction. The Catholic writers of the Counter-Reformation regarded the new religion as something imported from England, and they thought that the way to preserve

the old religion was to insist on the old Catholic culture. This was why Gruffydd Robert (*c.* 1535–1611), canon of Milan, published his *Dosbarth Byrr,* the first printed grammar of the Welsh tongue. This book is not a mere grammar; it consists of a series of discussions between teacher and disciple, and in beauty of style it stands among the greatest monuments of Welsh prose. Other works stimulated by the desire to preserve the old religion were Gruffydd Robert's *Drych Cristianogawl* (1585); *Theater du Mond* (1615), a translation from the French, and two other books in 1609 and 1611 by Dr. Rhosier Smyth (*c.* 1546–1625); *Athravaeth Gristnogawl* by Morys Clynnog (*c.* 1525–81); and *Eglurhad Helaethlawn* (1618), a translation from the Italian by John Salisbury. All these and some others were published on the Continent.

The Welsh Renaissance.—Just as Italy and other European countries under the Renaissance turned to the Latin and Greek classics, so Wales turned to its own classical tradition of bardism. The result was the publication during this period of some of the most important Welsh grammars. Gruffydd Robert's *Dosbarth Byrr* has been already mentioned; it was followed in 1592 by the *Cambrobrytannicae . . . Institutiones* of Dr. Siôn Davydd Rhys (1534–*c.* 1617), which was an attempt to set out before the learned world regulations of bardic poetry and principles of the Welsh language. This work is the foundation of all later grammatical studies, though Rhys was far surpassed in scientific knowledge by Dr. John Davies of Mallwyd, who published his *Antiquae Linguae . . . Rudimenta* in 1621 and his great dictionary *Dictionarium Duplex* in 1632. The Latin-Welsh portion of this dictionary was based on the work of Thomas Williams of Trefriw (*c.* 1550–*c.* 1618), which is still in manuscript.

Puritanism.—So far the writers of Welsh prose had contented themselves with translation. It was left to a Puritan, Morgan Llwyd (1619–59), to make an original contribution to Welsh religious thought. He came under three influences from the outside world, namely, the Quakers, the Fifth Monarchy Men, and Jacob Boehme, the German mystic. His chief work *Llyfr y Tri Aderyn* (The Book of the Three Birds) (1653) is a disquisition in two parts, on the theory of government and on religious liberty, under the form of a disputation between the Eagle (Cromwell or the secular power), the Raven (the Anglicans or organized religion) and the Dove (the Nonconformists or the followers of the inner light). In this and in many other works, notably *Llythur ir Cymru* (1653), he expounded a mystical gospel, which (unfortunately as some think) had very little influence, though many editions of his books were published.

From the time of Morgan Llwyd till well in the 19th century, translations, mostly of theological works, continued to pour out of the Welsh press, and it is almost impossible to thread one's way amongst these thousands of books. Many of them were inspired by the activities of the S.P.C.K., and among the clergy who produced books of this description were Edward Samuel (1674–1748), who published among other works *Holl Ddyledswydd Dyn,* a translation of *The Whole Duty of Man* (1718); Moses Williams (1684–1742), a most diligent searcher into Welsh mss. and a translator; Griffith Jones of Llanddowror (1683–1761), the father of Welsh popular education; Iago ab Dewi (?1644–1722) and Theophilus Evans (1694–1769), the famous author of *Drych y Prif Oesoedd* (1716 and 1740). This book, like *Llyfr y Tri Aderyn* and *Y Bardd Cwsc,* has an established position for all time in the annals of Welsh literature.

We come now to the greatest of all Welsh prose writers, Ellis Wynn o Lasynys (1671–1734). His first work was a translation of Jeremy Taylor's *Holy Living,* under the title of *Rheol Buchedd Sanctaidd* (1710). His next work was the immortal *Gweledigaetheu y Bardd Cwsc* (1703). The foundation of this work was L'Estrange's translation of the *Sueños* of the Spaniard Quevedo.

The Rise of Popular Poetry, 1600–1750.—When Henry VII. ascended the throne, the old hostility of the Welsh towards the English disappeared. Naturally enough the descendants of the old Welsh gentry began to look towards England for recognition and preferment, and their interest in their own little country began to wane. The result was that the traditional patrons of the Welsh could no longer understand the language of the poets, and the poets were forced to seek some more profitable employment. Besides, the old conditions were changing; it gradually and imperceptibly came about that the poets of the older school had no audience. The only poets who still followed the old tradition were the rich gentlemen-farmers who "sang on their own food," as the Welsh phrase goes. A new school, however, was rising. The nation at large had a vast store of folk-song, and it was this, despised and unrecorded, that became the groundwork of the new literature.

The first landmark in this new development was the publication in 1621 of Edmwnd Prys's metrical version of the Psalms, and in 1646 of the first poem of the *Welshmen's Candle* (*Canwyll y Cymry*) of Rhys Pritchard, vicar of Llandovery (1569–1644). These works were not written in the old metres peculiar to Wales, but in the free metres, like those of English poetry. The former is of great importance, as these Psalms were about the first metrical hymns in use. The latter work, the first complete edition of which was published in 1672, consisted of moral verses in the metres of the old folk-songs (*Penillion Telyn*). Many other poets of the early part of this period wrote in these metres, such as Rowland Fychan, Morgan Llwyd and Williamd Phylip (d. 1669). Poetry in the free metres, however, was generally very crude, until it was given a new dignity by the greatest poet of this period, Huw Morys o Bont y Meibion (1622–1709). Most of his earlier compositions, which are among his best, and which were influenced to a great extent by the cavalier poetry of England, are love poems, perfect marvels of felicitous ingenuity and sweetness. Towards the end of the period comes Lewys Morys (1700–65). His poetry alone does not seem to warrant his fame, but he was the creator of a new period, the inspirer and patron of Gronwy Owen. Like his brothers Richard and William, he was an accomplished scholar. His poetry, except a few well known pieces, will never be popular, because it does not conform to the modern canons of taste.

The Revival, 1750.—The middle of the 18th century was, after the 14th, the most fruitful period of Welsh literature. Up to this time, Wales had lain in a terrible stagnation, both social and literary; a people, who had till now never lacked self-expression in literature, had become inarticulate. It was clear that one of two things was essential if Welsh was to survive as a language of culture—either a re-creating literary influence from the outside, or some great spiritual or intellectual revival which would stir the people once more into articulate expression. It was a coincidence that both these events should happen in Wales at the same time.

The first event was the adoption by Gronwy Owen, inspired by Lewys Morys, of the literary standards of the English Augustan classicists; the result was the re-introduction into Welsh poetry of the *cywydd* and the *awdl* in all their traditional correctness of form, but with a new and larger content. Around Gronwy Owen were grouped other poets who thus established a classical school of poetry which is alive to this day; the more important among them were William Wynne of Llangynhaval (1704–60), and Evan Evans (1731–89). Much of the literary activity represented by this school was associated with the Welsh community in London, and with the establishment of the Hon. Society of Cymmrodorion. The direct result of the efforts of the London Welshmen to preserve and spread the knowledge of Welsh literature was the establishment of local eisteddfodau which were periodically held in different parts of Wales under the auspices of the learned societies. These eisteddfodau, by offering a chair for an *awdl* (this practice it must be noted only dates from the end of the 18th century), perpetuated the classical form, i.e., *cynghanedd* and the unfree metres, which would have otherwise certainly disappeared. Thus Gronwy Owen is the fountain-head of modern classicism and it is natural that his works should be the basis of modern literary studies at the schools and in the university. His successors, the eisteddfodic bards, though greatly inferior to him in poetic power, did much to reintroduce the knowledge of the classical forms; chief among these was Dafydd Ddu Eryri (1760–1822) who, both as a writer of *awdlau* and as a grammarian was the teacher of the 19th century. His successor, Dewi Wyn o Eivion (1784–1841), was the first to deviate from the strictness of the old tradition, and much of his work is strikingly deficient in quality. Eben Vardd (1802–63) was the last of the 19th century eisteddfodic

bards who made any real contribution to literature; he is the greatest poet of the descriptive school. After him eisteddfodic poetry, *i.e.*, poetry in the classical tradition, suffered eclipse; the last 40 years of the 19th century, though an enormous mass of so-called poetry was produced, saw what was probably the nadir of popular taste. The end of the 19th century was marked by a reaction back to Gronwy Owen and Davydd ap Gwilym.

The Free Metres, 1750–1890.—The classicists of the 18th century were quite unaware of the Methodist Revival, but it was the intensity of the religious emotion now set free for the first time that broke the inarticulateness which had befallen Wales. The vast store of experience and expression which had been accumulating out of sight in the *Penillion Telyn* (Folk Poetry) was at last displayed in the hymns of William Williams Pantycelyn (1717–91), almost the first poet to use the free metres for a serious purpose. Pantycelyn's hymns in time became by themselves a kind of national literature, and it was on this basis that all modern poetry in the free metres rests, so that in judging Welsh poetry, it must always be remembered that the modern form of it is less than two centuries old. Pantycelyn was followed by many hymn-writers, the last and greatest being Anne Griffiths (1776–1805) who alone shows a trace of that mysticism which was lost in Wales after Morgan Llwyd. The literary importance of the hymns lies in their preparation of the Welsh language for secular poetry. All the poetry of the 19th century betrays its religious origin, the later poetry no less than the earlier. John Blackwell (Alun) (1797–1840) may be regarded as the father of the modern secular lyric. Much of his inspiration came from contemporary English songs and in originality he is inferior to Ieuan Glan Geirionydd (1795–1855) who founded the "Eryri" school of poetry inspired by the natural scenery of Snowdonia; the best known member of this school is Glasynys (1828–70). These earlier lyric writers were followed by a more Bohemian group consisting of Talhaearn (1810–69), Mynyddog (1833–77) and Ceiriog (1832–87). Ceiriog was the greatest lyrical writer of the century. He was the last of the Welsh Victorians. Only one poet, Islwyn (1832–78), made a success of the long poem. His *Ystorm*, which is a series of mystical meditations on life and art, is in the first rank.

Prose, 1750–1880.—For a long time after 1750 Welsh prose though abundant in quantity had a very narrow range. Few writers rose above theological controversy, and the humaner side of literature was almost altogether neglected. The end of the 18th century, however, in Wales as well as in England, saw much activity in political thought, which was the direct result of the French Revolution. The most important of the early political writers was John Jones Glan y Gors (1767–1821), the author of two political pamphlets, much influenced by Tom Paine. Later when modern Liberalism began to emerge, political writing, after the establishment of the periodical press, became an important part of Welsh literature. The greatest political thinker and writer of the century was Samuel Roberts (1800–85), who, with Gwilym Hiraethog (1802–83), may be regarded as having, through his prose writings, formed the habit of thought still prevalent in Wales.

Literary criticism up to the middle of the 19th century had been confined to the work of eisteddfod adjudicators who were still acting on the old classical theory, *ut pictura poesis*. The first appearance of a criticism which might be said to follow European standards was in the articles of Lewis Edwards (1809–87), the founder and editor of the *Traethodydd*, though his ideas were dominated by the Edinburgh school. Literary criticism made no progress at all until the great revival in the 20th century. It was in this period that Wales had her national novelist, Daniel Owen (1836–95), a writer of the Dickens school, who like his master "wrote mythology rather than fiction." His novels, in spite of their rather obvious sentimentality, must always remain the most important document for the study of this extraordinary period of theocracy in Wales.

The Second Revival.—The most important event in Welsh literature was the founding of the university (1878–1905). The immediate result was a great widening of the horizons, accompanied by a strong reaction towards the old Welsh classical ideas. The two men who had most influence on this new movement were Sir Owen Morgan Edwards (1858–1920) and Sir John Morris-Jones. The former in his numerous books, both by the charm of his style and by the lure of his imagination, made the Welsh conscious of their literary identity, and he was certainly the inspiring genius of the new movement on its purely literary side. The latter, by insisting that correctness was the first essential of style and sincerity the first essential of the literary art, revolutionized first the product of the Eisteddfod, and then literature in general. Another critic, whose worth is only slowly being recognized, and whose fearless essays stung the nation into sincerity was Emrys ap Iwan (1851–96).

The extent of the new literary revival is hardly credible to anyone whose study of Welsh ends with 1900. Almost every department of literature is represented by work which may bear comparison with similar work in any country in Europe. Poetry has again become significant. Thomas Gwynn Jones has shown that the *cynghanedd* and the old tradition can answer any demand made upon it by the modern interpretation of life; his work is, however, not confined to the un-free metres. Robert Williams Parry has brought back to poetry the gift of poetic observation, expressed in a faultless technique, which had disappeared from Welsh poetry with Davydd ap Gwilym. The more popular poets, Eivion Wyn (d. 1926), Wil Ifan, and Crwys, though still under the domination of the old sentimental view of life, are as much the product of the new Revival of Learning as the more academic poets.

In prose there has been equal progress. A new literary criticism has been enriched by the influence of European ideas, which can be most clearly seen in the work of Saunders Lewis. No long novel of great merit has been written, though the work of Tegla Davies bears many traits of pure genius. The younger prose writers have developed the art of the short story to a high degree; the early promise of Dewi Williams has not been fulfilled, but Kate Roberts's work stands by itself as a striking example of the impact of contemporary Welsh life on a sensitive nature. Starting with no traditions, drama has made considerable progress, though it has been retarded by material reasons. Two dramatists deserve special mention, D. T. Davies and R. G. Berry. The Report of the Government's Departmental Committee on Welsh suggests that the language will be more fully used in education.

Bibliography.—(Note: only books dealing with literature in general or with a section of it are included. Editions of poetical works, etc., are only mentioned when they contain an introduction dealing with literature.) T. Stephens, *Literature of the Kymry* (2nd ed., 1876); Gweirydd ap Rhys, *Hanes Llenyddiaeth Gymreig, 1300–1650* (1885); C. Ashton, *Hanes Llenyddiaeth Gymreig, 1651–1850;* J. Loth, *Les Mabinogions* (2nd ed., 1913), *Contributions à l'Étude des Romans de la Table Ronde* (1912); T. Shankland, *Diwygwyr Cymru*, reprinted from *Seren Gomer* (1899); G. Lleyn, *Llyfryddiaeth y Cymry* (2nd ed., Llanidloes, 1869); C. Ashton, *Bywyd ac Amserau yr Esgob Morgan* (Treherbert, 1891); I. Ffoulkes, *J. Ceiriog Hughes, ei fywyd ai waith* (Liverpool, 1887); I. Williams, *Dafydd ap Gwilym ai Gyfoeswyr* (Bangor, 1914); I. Williams and H. Lewis, *Iolo Goch ac Eraill* (Bangor, 1926); J. Morris-Jones, *Cerdd Dafod* (1925); T. Gwynn Jones, *Gwaith Tudur Aled* (Cardiff, 1926); *Llenyddiaeth y Cymry* (Denbigh, 1915); Th. M. Chotzen, *Recherches sur la Poésie de Dafydd ab Gwilym* (Amsterdam, 1927); W. J. Gruffydd, *Llenyddiaeth Cymru, 1450–1600* (Liverpool, 1922); *Llenyddiaeth Cymru, 1540–1660* (Wrexham, 1926); *Math vab Mathonwy* (Cardiff, 1928). *See* also many articles in the *Cymmrodor; Transactions of the Hon. Society of Cymmrodorion: Zeitschrift für Celtische Philologie; Revue Celtique; Cymru* (Carnarvon and Wrexham); *Beirniad* (Liverpool); *Geninen* (Carnarvon); *Llenor* (Wrexham). (W. J. Gr.)

WELSH LAWS or **LEGES BRITANNIAE.** The earliest and best manuscripts of these, whether in their original Welsh or Latin, do not date from before 1175–1200. Confessedly recensions and reflecting current politics, they bear notwithstanding so striking a general resemblance to one another, that it is hard not to credit their common tradition, namely, that they hail from one original codification of British law and custom by King Howel Dda (*i.e.*, the Good), who died 950. The Welsh manuscripts fall into three classes, each of which begins with its own type of preface. (1) Those which refer exclusively to the king of Aberffraw in north-west Wales and give other indications that they pertain to that kingdom, *i.e.*, Gwynedd or Venedotia, of

which Aberffraw in Anglesey was the chief royal residence. The jurist Iorwerth ap Madog (*c.* 1200) would seem to be responsible for this recension, which Aneurin Owen in 1841 dubbed, not inappropriately, "the Venedotian code." (2) Those which refer exclusively to the king of Dinefwr (anglice Dynevor) in "the South," but would seem from the preface to have prevailed in Powys. The jurists favoured are Morgeneu and his son Cyfnerth. Owen unfortunately called these "the Gwentian code" as pertaining to south-east Wales, of which the manuscripts provide no indication. (3) Those which refer to both the kings of Dinefwr and Aberffraw, stating expressly that of all the kings in Wales gold is payable only to these two. But as they put Dinefwr before Aberffraw and refer to Rhys ap Gruffudd (d. 1197), one of the Dinefwr kings, and contain a special section on Dyfed or Demetia in south-west Wales, they certainly pertain to "the South." Owen, however, called them insufficiently "the Dimetian code." The jurist named in the preface is Blegywryd, who is otherwise known as having intervened in a dispute in 955, where he is described as "that most famous man" (*Bk. of Llan Dav*, 219). He is also known from some ancient Latin verses to have been a teacher of law in Howel's court and to have written a book of laws for the king, which book the king gave "ad partem dexteram," *i.e.*, to "the South," in Welsh Deheubarth, which stands for "Dextera Pars Britanniae," the south part of Britannia or Wales (omitting however Morgannwg, the country from Swansea to Chepstow).

That these three classes really represent law books in vogue in Gwynedd, Powys, and Deheubarth, respectively, seems to be implied or reflected in the preface of the last mentioned class, where we are told that "Howel ordered three law books to be made, one for the daily court to be always with him, another for the court of Dinefwr, the third for the court of Aberffraw, so that the three divisions of Wales, to wit, Gwynedd, Powys and Deheubarth should have the authority of law in their midst, at their need, always and ready." Readers for their guidance should bear in mind: (1) That the earliest mss. extant were written when the Norman French had long interfered in Welsh affairs and had already permanent possession of most of the petty kingdoms of south Wales; when also Geoffrey of Monmouth's *History of the Kings of Britain* was further confirming men's minds in the bizarre notions of the Welsh past, which had originally been set going by the book called *De excidio Britanniae* used by Bede. (2) That Howel Dda was not an original begetter of Welsh law. What Howel did was to "put together the laws of Britannia" (*i.e.*, Wales) with the consent and after the consideration of the wise men of his realm, assembled in one place. (3) That it is not conducive to sound knowledge to accentuate the "tribal" nature of the Welsh laws. No term for "tribe" appears. To read "tribes," therefore, into the Welsh laws is not only to force the text, but to obfuscate the emergence of Wales into the Dark Age from Romano-British Christian civilization.

Lloyd, *History of Wales* (1912) pp. 283–356; G. Evans, *Facsimile of Chirk Codex.* (1921); T. P. Ellis, *Welsh Tribal Law* (1926) *Aberystwyth Studies*, x. (1928).

(A. W. W-E.)

WELSHPOOL, a town of Montgomeryshire. Pop. (1921) 5,682. Welshpool was thrice burnt by the Llewellyns in 1233, 1257 and 1275, and often stands out in connection with conflicts around the red castle of the princes of Upper Powys (12th century onwards); this castle is now the seat of the earl of Powys. The park contains some of the largest oaks in the country.

WELWITSCHIA: *see* GYMNOSPERMS.

WEMBLEY, an urban district of Middlesex, England. The population was nearly quadrupled between 1901–21, when it was 16,187, and it is still growing rapidly. Wembley Park was the site for the British Empire Exhibition in 1924–25. This covered a semi-circular tract of about 2¼ m., with railways north and south and in the grounds. A main thoroughfare, Kingsway, leading from the north entrance, was flanked by the palaces of industry and of housing and transport, and by the buildings for Australia and Canada, and gave at the southern end upon the stadium, which had an area of 10 ac. and accommodated nearly 100,000 people. Here were staged numerous ceremonies, spectacles and athletic contests. Besides those mentioned above, each major division of the empire overseas had its pavilion, the most notable being those of India, South Africa, New Zealand and Malaya. There was a British government pavilion, with exhibits by various government departments and a scientific exhibit organized by the Royal Society. There were also a palace of arts, an amusement park, an artificial lake and many other features designed at once to demonstrate the vast resources of the empire and to attract the public. (*See* also EXHIBITION: BRITISH EMPIRE.) Part of the exhibition site is now being used for new factories, film studios, etc. The manor of Wembley belonged to the priory of Kilburn until that foundation was dissolved by Henry VIII.

WEMYSS (wēmz), **EARLS OF,** title of a Scottish family who had possessed the lands of Wemyss in Fifeshire since the 12th century. In 1628 Sir John Wemyss, created a baronet in 1625, was raised to the peerage as Baron Wemyss of Elcho; and in 1633 he became earl of Wemyss, and Baron Elcho and Methel, in the peerage of Scotland. He took part with the Scottish parliament against Charles I., and died in 1649. On the death of David, 2nd earl of Wemyss (1610–1679), the estates and titles passed to his daughter Margaret, countess of Wemyss, whose son David, 3rd earl of Wemyss, succeeded on her death in 1705. His son James, 4th earl (1699–1756), married Janet, daughter of Colonel Francis Charteris, who had made a large fortune by gambling. His son David, Lord Elcho (1721–1787), was attainted for his part in the Jacobite rising of 1745, the estates passing to his younger brother James, while the title remained dormant after his father's death, though it was assumed by Elcho's brother Francis, who took the name of Charteris on inheriting his maternal grandfather's estate. A reversal of the attainder was granted in 1826 to his descendant Francis Charteris Wemyss Douglas (1772–1853), who had been created Baron Wemyss of Wemyss in the peerage of the United Kingdom in 1821, and had assumed the name of Charteris Wemyss Douglas on inheriting some of the Douglas estates through a female ancestor. Thenceforward the title descended in the direct line.

WEMYSS, parish of Fifeshire, Scotland, embracing the village of East Wemyss, the burgh of barony of West Wemyss and the police burgh of Buckhaven (with Methil and Innerleven), a fishing port on the north of the Firth of Forth. Coal mining is the principal industry. A new dock was opened at Methil in 1913. Pop. of Buckhaven, Methil and Innerleven (1921), 16,232; of Wemyss parish, 24,530. Nets are made at Buckhaven and there are a brewery and a linen factory at East Wemyss. On the shore are two square towers attributed to Macduff's castle; and near them are the remarkable caves with archaic sculptures from which the district derives its name (weems, from the Gaelic, *uamha*). Wemyss castle is the ancient seat of the family of the name. It was at Wemyss castle that Mary, queen of Scots, first met the earl of Darnley, in 1565, and her room is still known as "the Presence Chamber."

WEN. The popular name for a sebaceous cyst, *i.e.*, an adenoma (*see* TUMOUR), formed from a sebaceous gland and therefore occurring in the neighbourhood of hairy parts, particularly the scalp and neck. The fatty or sebaceous material collects in the centre of the mass and the normal opening of the duct of the gland is often recognizable on the surface as a minute point. A wen may be as large as a hen's egg. The treatment is surgical removal.

WENATCHEE, a city of central Washington, U.S.A. Pop. (1920) 6,324 (91% native white); (1928 estimate) 12,000. Wenatchee is the distributing centre for four fertile valleys which constitute a vast apple orchard, with 40,000 ac. under cultivation, producing annually 18,000 car-loads of the finest fruit. A blossom festival is held every spring. There are lakes, Alpine gardens, and mountain resorts within an hour's drive. Wenatchee was chartered in 1892.

WENCESLAUS (1361–1419), German king, and, as Wenceslaus IV., king of Bohemia, was the son of the emperor Charles IV.

and Anna, daughter of Henry II., duke of Schweidnitz. Born at Nuremberg on Feb. 26, 1361, he was crowned king of Bohemia in June 1363, and invested with the margraviate of Brandenburg in 1373. In September 1370 he married Joanna (d. 1386) daughter of Albert I., duke of Bavaria, and was elected king of the Romans or German king at Frankfort on June 10, 1376, and crowned at Aix-la-Chapelle on July 6 following. He took some part in the government of the empire during his father's lifetime, and when Charles died in November 1378 became sole ruler of Germany and Bohemia, but handed over Brandenburg to his half-brother Sigismund. Germany was torn with feuds, the various orders for the establishment of peace were disregarded, and after 1389 the king paid very little attention to German affairs. In 1383 he inherited the duchy of Luxemburg from his uncle Wenceslaus and in 1387 assisted his half-brother Sigismund to obtain the Hungarian throne.

For some time Wenceslaus ruled Bohemia successfully, but he quarrelled with the nobles; and in 1394 the king was taken prisoner and only released under pressure of threats from the German princes. Having consented to limitations on his power in Bohemia, he made a further but spasmodic effort to restore peace in Germany. He then met Charles VI., king of France at Reims, where the monarchs decided to persuade the rival popes Benedict XIII. and Boniface IX. to resign, and to end the papal schisms by the election of a new pontiff. Many of the princes were angry at this abandonment of Boniface by Wenceslaus, who had also aroused much indignation by his long absence from Germany and by selling the title of duke of Milan to Gian Galleazzo Visconti. The consequence was that in August 1400 the four Rhenish electors met at Oberlahnstein and declared Wenceslaus deposed. Though he remained in Bohemia he took no steps against Rupert III., count palatine of the Rhine, who had been elected as his successor. He soon quarrelled with Sigismund, who took him prisoner in 1402 and sent him to Vienna, where he remained in captivity for nineteen months after abdicating in Bohemia. In 1404, when Sigismund was recalled to Hungary, Wenceslaus regained his freedom and with it his authority in Bohemia.

His concluding years were disturbed by the troubles which arose in Bohemia over the death of John Huss, and which the vacillating king did nothing to check until compelled by Sigismund. In the midst of these disturbances he died at Prague on Aug. 16, 1419. His second wife was Sophia, daughter of John, duke of Bavaria-Munich, but he left no children.

See Th. Lindner, *Geschichte des deutschen Reiches vom Ende des 14ten Jahrhunderts bis zur Reformation*, part i. (Brunswick, 1875–80), and "Die Wahl Wenzels," in the *Forschungen zur deutschen Geschichte*, Band xiv. (Göttingen, 1862–86); F. M. Pelzel, *Lebens-geschichte des römischen und böhmischen Königs Wenceslaus* (Prague, 1788–90); F. Palacky, *Geschichte von Böhmen*, Bände iii. and iv. (Prague, 1864–74); H. Mau, *König Wenzel und die rheinischen Kurfürsten* (Rostock, 1887). The article by Th. Lindner in the *Allgemeine deutsche Biographie*, Band xli., should also be consulted for a bibliography, and also the same writer's work, *Das Urkundenwesen Karls IV. und seiner Nachfolger* (Stuttgart, 1882).

WÊN-CHOW-FU, a city in the province of Che-Kiang, China, and one of the five ports opened by the Chifu convention (1876) to foreign trade, situated on the river Gow, about 20 m. from the sea. The population is estimated at 80,000.

The site is said to have been chosen by Kwo P'oh (A.D. 276–324) a celebrated antiquary, and the town became known as Tow, or Great Bear, from a supposed topographical similarity of the neighbouring hills to the constellation. Later, through another legend, it became known as the Deer city, or Luh. During the Ming dynasty (1368–1644) it received its present name ("mild district"). The city is enclosed in a wall built in the 10th century, which is about 4 m. in circumference.

WENDEN or **VENDEN,** now Cesis or Tseziz, a small town of Latvia on the Gauja river. Here are the ruins of a former castle of the Brethren of the Sword, afterwards (from 1237) of the grandmaster of the Teutonic Knights. In 1577 the garrison blew it up to prevent it from falling into the hands of Ivan the Terrible of Russia. It was rebuilt, but was burned in 1748.

WENDOVER, a market town in Buckinghamshire, England. Pop. (1921) 2,366. It is situated in a shallow defile of the Chiltern hills. Wendover is on the Upper Icknield Way and traces of a British settlement have been found. John Hampden and Edmund Burke represented the borough. From the time of Edward IV. weekly markets were held for over four hundred years, and fairs have been held in October and May from that day to this.

WENDT, HANS HINRICH (1853–), German Protestant theologian, was born in Hamburg on June 18, 1853. He became in 1885 professor ordinarius of systematic theology at Heidelberg, and in 1893 was called to Jena. His work on the teaching of Jesus (*Die Lehre Jesu*, 1886–90; Eng. trans. of second part, 1892) made him widely known. He also edited several editions (5th to 8th, 1880–98) of the *Commentary on the Acts of the Apostles* in H. A. W. Meyer's series.

His works include: *Die christliche Lehre von der menschlichen Vollkommenheit* (1882), *Der Erfahrungsbeweis für die Wahrheit des Christentums* (1897), and *Das Johannesevangelium* (1900; Eng. trans., 1902).

WENGEN (4,190 ft.), a health resort and winter sports centre situated on a ledge on the slopes of the Jungfrau in the Bernese Oberland, Switzerland. The place is linked with Interlaken and Lauterbrunnen by a rock railway. From the Little Scheidegg a branch leads to the Jungfraujoch (11,340 ft.) where is the highest station in Europe.

WENLOCK, borough of Shropshire, England, on the river Severn. Pop. (1921) 13,714. It includes the towns of BROSELEY, MADELEY and MUCH WENLOCK (*q.v.*). The parish of Madeley includes Ironbridge and Coalport, with part of COALBROOKDALE (*q.v.*). The district contains limestone quarries, some coal-mines and iron-works.

Wenlock (*Weneloche*) is said to be of pre-Roman origin, but owed its early importance to the nunnery founded *c.* 680 by St. Milburg. This was destroyed by the Danes but refounded as a priory by Earl Leofric in 1017. It was again deserted after the Conquest until Roger de Montgomery founded a house of the Cluniac order on its site. The town was a borough by prescription, and its privileges began with the grants made to the priory and its tenants. It was incorporated by Edward IV. in 1468 and the charter was confirmed in 1547 by Henry VIII. and in 1631 by Charles I. In the report of 1835 the borough is said to consist of 17 parishes and to be unfit for corporate government. By the charter of Edward IV. the town obtained the right of sending two members to parliament, but was disfranchised in 1885. The first grant of a market and fair is dated 1227. The right is still valid.

WENNERBERG, GUNNAR (1817–1901), Swedish poet, musician and politician, was born at Lidköping, of which place his father was parish priest, on Oct. 2, 1817. In his twentieth year he became a student at Upsala. In 1843 he became a member of the musical club who called themselves "The Juvenals," and for their meetings were written the trios and duets, music and words, which Wennerberg began to publish in 1846. In the following year appeared the earliest numbers of *Gluntarne* (or "The Boys"), thirty duets for baritone and bass, which continued to be issued from 1847 to 1850. These remarkable productions, masterpieces in two parts, presented an epitome of all that was most unique and most attractive in the curious university life of Sweden. In 1850 Wennerberg travelled through Sweden, singing and reciting in public, and his tour was a long popular triumph. In 1860 he published his collected trios, as *The Three*. He succeeded Fahlcrantz in 1866 as one of the eighteen of the Swedish Academy. He was minister for education (*Ekklesiastikminister*) in the Adlercreutz government (1870–75), and sat first in the lower, then in the upper house of the legislature until he was nearly eighty. He died, on Aug. 24, 1901, at the royal castle of Leckö.

WENSLEYDALE, JAMES PARKE, BARON (1782–1868), English judge, was born near Liverpool on March 22, 1782. He was educated at Macclesfield Grammar school and Trinity college, Cambridge. He was a junior counsel for the Crown in the Queen's trial. In 1834 he was transferred from the king's bench to the court of exchequer, where for some 20 years he exercised considerable influence. The changes introduced by the Common Law Procedure Acts of 1854, 1855, proved too much for his legal conservatism and he resigned in December of the latter

year. The Government, anxious to have his services, as a law lord in the House of Lords, proposed to confer on him a life peerage, but this was opposed by the House of Lords (*see* PEERAGE), and he was eventually created a peer with the usual remainder (1856). He died at his residence, Ampthill Park, Bedfordshire, on Feb. 25, 1868, and having outlived his three sons, the title became extinct. Parke was perhaps the last of the great "block-letter lawyers," the men to whom technicalities were the breath of life. Of his devotion to the intricacies of pleading the stories are innumerable; best is perhaps that of his taking one of his special demurrers to read to a dying friend. "It was so exquisitely drawn," he said "that it must cheer him to read it." In Serjeant Hayes' *Cugate's Case*, printed in Holdsworth's *History of English Law*, Parke figures as "Baron Sussebutter."

See E. Nanson, *Builders of Our Law* (London, 1904).

WENSLEYDALE, the upper valley of the river Ure in Yorkshire, England. The valley widens into the Vale of York.

As far up as Hawes, broken limestone crags of the valley walls with high lying moors beyond them contrast with the fertile valley bottom. Beyond Hawes, towards the source, the valley becomes a bleak, wide, shallow drift-covered area with much wilder scenery. On both sides, throughout the dale, steep sided tributary valleys with torrent streams are numerous. Magnificent morainic hills may be seen between Masham and Jervaulx. The dale is characterized by terraced hills caused by the fact that the limestone beds are thin and form sequences with shales and sandstones, and by abundant waterfalls. The chief falls are Aysgarth Force where the Ure descends in three cascades extending over 1½ m. in length and with a total fall of over 100 ft.; Hardraw Force near Hawes, the finest of all, which leaps over a projecting ledge of limestone 96 ft. high, leaving a clear passage behind it; and Mill Gill Force on a tributary near Askrigg. In the bed of the Mill Gill above the falls are narrow canyon-like gorges with peculiar solution drainage, which is also found in the Buttertubs pass near Hawes and in Oxnop Gill north of Askrigg.

At Bainbridge are the remains of a square Roman camp. Jervaulx abbey, the ivy-clad ruins of which stand on the right bank of the river, was founded in 1156 by Cistercians from Byland who had previously settled near Askrigg. The remains are mainly transitional Norman and Early English and are not extensive. The chapter house, refectory and cloisters remain in part. Above the small town of Middleham rises the massive Norman keep of a 12th century castle; subsidiary buildings surrounding the tower date down to the 14th century. The castle was a stronghold of Warwick the "King-maker." In Coverdale, near Middleham, are the curious remains of the Premonstratensian abbey of Coverham, founded here in the 13th century and retaining the gatehouse and other portions of Decorated date. Farther up the valley, standing high on the north side, is Bolton castle, founded in the time of Richard I. Its walls, four corner towers, and fine position still give it an appearance of great strength. Wensley must have been an important centre in very early times. Eight pre-Norman sculptured stones, dating from the 8th to the 11th centuries have been discovered in the walls of the church. The present church was built in the 13th century. It possesses some interesting carved woodwork dating from about 1510, a large proportion of which was brought from Easby abbey at the period of the dissolution of the monasteries.

WENTWORTH, the name of an English family, various members of which are separately noticed. (*See* also FITZWILLIAM, ROCKINGHAM, STRAFFORD, CLEVELAND, LOVELACE.) The Wentworths trace their descent to William Wentworth (d. 1308) of Wentworth Woodhouse, Yorks. Thomas Wentworth (1501–1559) was summoned to parliament as Baron Wentworth of Nettlestead in 1529. The last baron Wentworth in the male line was Thomas (1613–1645), son of Thomas Wentworth, 1st earl of Cleveland (*q.v.*). His daughter Henrietta Maria became Baroness Wentworth in her own right on her grandfather's death. This lady, who was the duke of Monmouth's mistress, died unmarried in 1686. The barony of Wentworth then reverted to Cleveland's daughter Anne, who married the 2nd Lord Lovelace, from whom it passed to her grand-daughter Martha (d. 1745), wife of Sir Henry Johnson, and afterwards to a descendant of Anne's daughter Margaret, Edward Noel, who was created Viscount Wentworth of Wellesborough in 1762. The viscountcy became extinct at his death, and the barony again passed through the female line in the person of Noel's daughter Judith to the latter's daughter Anne Isabella, who married Lord Byron the poet; and from her to Byron's daughter Augusta Ada, whose husband was in 1838 created earl of Lovelace. The barony of Wentworth was thereafter held by the descendants of this nobleman in conjunction with the earldom of Lovelace.

WENTWORTH, PETER (1530–1596), English politician, was a prominent Puritan leader in parliament, which he first entered as member for Barnstaple in 1571. He was examined by the Star Chamber in connection with a speech delivered in parliament on Feb. 8, 1576, and spent some time in the Tower. He was enduring a third imprisonment in the Tower when he died on Nov. 10, 1596. While in the Tower he wrote *A Pithie Exhortation to her Majesty for establishing her Successor to the Crown*, a famous treatise preserved in the British Museum. Peter Wentworth was twice married; his first wife, by whom he had no children, was a cousin of Catherine Parr, and his second a sister of Sir Frances Walsingham, Elizabeth's secretary of State. His third son, Thomas Wentworth (*c.* 1568–1623), recorder of Oxford, was an ardent opponent of royal prerogative in parliament, where he represented Oxford from 1604 until his death.

A grandson, SIR PETER WENTWORTH (1592–1675), represented Tamworth in the Long Parliament, but refused to act as a commissioner for the trial of Charles I. He was a member of the council of State during the Commonwealth; but was denounced for immorality by Cromwell in April 1653, and his speech in reply was interrupted by Cromwell's forcible expulsion of the Commons. By his will he left a legacy to John Milton, and considerable estates to his grand-nephew Fisher Dilke, who took the name of Wentworth; and this name was borne by his descendants until dropped in the 18th century by Wentworth Dilke Wentworth, great-grandfather of Sir Charles Wentworth Dilke (*q.v.*).

WENTWORTH, WILLIAM CHARLES (1793–1872), the "Australian patriot," was born in 1793 in Norfolk Island, the penal settlement of New South Wales, the son of D'Arcy Wentworth, the government surgeon of the settlement. The son was educated in England, but he spent the interval between his schooling at Greenwich and his matriculation (1816) at Peterhouse, Cambridge, in adventurous exploration in the Blue Mountains, Australia. Having been called to the bar, he began to practise in Sydney. With a fellow barrister, Wardell, he started a newspaper, the *Australian*, in 1824, to advocate the cause of self-government and to champion the "emancipists"—the incoming class of ex-convicts, now freed and prospering—against the "exclusivists"—the officials and the more aristocratic settlers. With Wardell, Dr. William Bland and others, he formed the "Patriotic Association," and carried on a determined agitation both in Australia and in England, where they found able supporters.

They attacked the governor, Sir Ralph Darling, who was recalled in 1831 to give evidence before a select committee of the House of Commons on his administration. The Constitution Act of 1842 was generally recognized as mainly Wentworth's work. In the first legislative council, he led the "squatter party."

He was the founder of the University of Sydney (1852), he led the movement which resulted in the new constitution for the colony (1854), and in 1861 became president of the new legislative council. For some years before 1861 he lived chiefly in England, where in 1857 he founded the "General Association for the Australian Colonies," with the object of obtaining from the government a federal assembly for the whole of Australia; and in 1862 he definitely settled in England, dying on March 20, 1872. His body was taken to Sydney and accorded a public funeral.

WERDEN, a town in the Prussian Rhine province, on the river Ruhr, 6 m. by rail S. of Essen. Pop. (1925) 13,201. Werden grew up around the Benedictine abbey, dissolved in 1802.

WERFEL, FRANZ (1890–), German writer, was born in Prague on Sept. 10, 1890, and lived successively in Prague, Hamburg, Leipzig, Vienna and Breitenfeld, near Vienna. His early

poems, *Der Weltfreund* (1912), *Wir Sind* (1913), *Einander* (1915) and *Der Gerichtstag* (1919), were difficult but beautiful in expression, and were animated by the idea of the community of souls in all living things. The World War and subsequent political troubles gave Werfel's work a strongly revolutionary tinge; his brotherhood seemed best attained by the destruction of obstacles erected by tradition. His two novels, *Nicht der Mörder, der Ermordete ist schuld* (1920) and *Der Abituriententag*, deal with the problems and revolt of adolescence, but are less fine than his verse, which ranks with the most powerful in modern German literature. His dramatic works include an adaptation of Euripides' *Troades* (1915); a very brilliant symbolic trilogy, *Der Spiegelmensch* (1920); the more conventional *Juarez und Maximilian* (1924); *Paulus unter den Juden* (1926) and *Der Tod des Kleinbürgers* (1926). He also wrote a novel on the opera *Verdi* (1924).

See A. Luther, *Franz Werfel und seine besten Bühnenwerke* (1922).

WERGELAND, HENRIK ARNOLD (1808–1845), Norwegian poet and prose writer, was born at Christiansand on June 17, 1808. He was the eldest son of Professor Nikolai Wergeland (1780–1848), who had been a member of the constitutional assembly which proclaimed the independence of Norway in 1814 at Eidsvold. He established libraries, and tried to alleviate the widespread poverty of the Norwegian peasantry. But his numerous and varied writings were coldly received by the critics, and a monster epic, *Skabelsen, Mennesket og Messias* (Creation, Man and Messiah), 1830, showed no improvement in style. It was remodelled in 1845 as *Mennesket*. From 1831 to 1835 Wergeland was submitted to severe satirical attacks from J. S. le Welhaven and others, and his style improved in every respect. His popularity waned as his poetry improved, and in 1840 he found himself a really great lyric poet, but an exile from political influence. In that year he became keeper of the royal archives. He died on July 12, 1845. In 1908 a statue was erected to his memory by his compatriots at Fargo, North Dakota. His *Jan van Huysums Blomsterstykke* (1840), *Svalen* (1841), *Jöden* (1842), *Jödinden* (1844) and *Den Engelske Lods* (1844), form a series of interesting narrative poems in short lyrical metres.

Wergeland's *Samlede Skrifter* (9 vols., Christiania, 1852–1857) were edited by H. Lassen, the author of *Henrik Wergeland og hans Samtid* (1866), and the editor of his *Breve* (1867). *See* also H. Schwanenflügel, *Henrik Wergeland* (Copenhagen, 1877); and J. G. Kraft, *Norsk Forfatter-Lexikon* (Christiania, 1857), for a detailed bibliography.

WERMUND, an ancestor of the Mercian royal family, a son of Wihtlaeg and father of Offa. He appears to have reigned in Angel, and his story is preserved by certain Danish historians, especially Saxo Grammaticus. According to these traditions, his reign was long and happy, though its prosperity was eventually marred by the raids of a warlike king named Athislus, who slew Frowinus, the governor of Schleswig, in battle. Frowinus's death was avenged by his two sons, Keto and Wigo, but their conduct in fighting together against a single man was thought to form a national disgrace, which was only obliterated by the subsequent single combat of Offa. It has been suggested that Athislus, though called king of the Swedes by Saxo, was really identical with the Eadgils, lord of the Myrgingas, mentioned in Widsith. As Eadgils was a contemporary of Ermanaric (Eormenric), who died about 370, his date would agree with the indication given by the genealogies which place Wermund nine generations above Penda. Frowinus and Wigo are doubtless to be identified with the Freawine and Wig who figure among the ancestors of the kings of Wessex.

For the story of the aggression against Wermund in his later years, told by the Danish historians and also by the *Vitae duorum Offarum*, *see* OFFA; also Saxo Grammaticus, *Gesta Danorum*, edited by A. Holder, pp. 105 ff. (Strassburg, 1886); *Vitae duorum Offarum* (in Wats's edition of Matthew Paris, London, 1640). *See* also H. M. Chadwick, *Origin of the English Nation* (Cambridge, 1907).

WERNER, ABRAHAM GOTTLOB (1750–1817), father of German geology, was born in Upper Lusatia, Saxony, on Sept. 25, 1750. He was educated at Bunzlau, Silesia, and in 1764 joined his father at Count Solm's iron-works at Wehrau and Lorzendorf, with the idea of ultimately succeeding him as inspector. In 1769, however, he entered the mining school at Freiburg, and in 1771 went to Leipzig, where he studied law and mineralogy. In 1775 he was appointed inspector and teacher in the mining school at Freiberg. He devoted himself for 40 years to the development of the school, which rose to be one of the centres of scientific intelligence in Europe. He died at Freiburg on June 30, 1817.

One of the distinguishing features of Werner's teaching was the care with which he taught lithology and the succession of geological formation; a subject to which he applied the name geognosy. His views on a definite geological succession were inspired by the works of J. G. Lehmann and G. C. Fuchsel (1722–73). He showed that the rocks of the earth follow each other in a certain definite order. He had never travelled, and the sequence of rock-masses which he had recognized in Saxony was believed by him to be of universal application. (*See* his *Kurze Klassifikation und Beschreibung der verschiedenen Gebirgsarten*, 1787.) He taught that the rocks were precipitates of a primaeval ocean, and followed each other in successive deposits of world-wide extent. Volcanoes were regarded by him as abnormal phenomena, probably due to the combustion of subterranean beds of coal. Basalt and similar rocks, already recognized by other observers as of igneous origin, he believed to be water-formed accumulations of the some ancient ocean. Hence arose one of the great historical controversies of geology. Werner's followers preached the doctrine of the aqueous origin of rocks, and were known as Neptunists; their opponents, who recognized the important part taken in the construction of the earth's crust by subterranean heat, were styled Vulcanists. R. Jameson, the most distinguished of his British pupils, was for many years an ardent teacher of the Wernerian doctrines. Though much of Werner's theoretical work was erroneous, science is indebted to him for so clearly demonstrating the chronological succession of rocks.

See S. G. Frisch, *Lebensbeschreibung A. G. Werners* (Leipzig, 1825); Lyell, *Principles of Geology* (1830); and Sir A. Geikie, *Founders of Geology* (1897; 2nd ed., 1906).

WERNER, ALFRED (1866–1919), French-Swiss chemist, was born at Mulhouse on Dec. 12, 1866. In 1886 he went to Zürich to study, and later worked at Zürich with Lunge and in Paris with Berthelot, but returned in 1893 as extra-ordinary professor of chemistry at Zürich. In 1895 he was made ordinary professor of chemistry, an appointment he held until his death on Nov. 15, 1919. He was awarded the Nobel prize in 1913.

Werner's earliest work was with Hantzach on the stereochemistry of the oximes (*q.v.*), but his greatest contribution to chemistry was the co-ordination theory of Valency (*q.v.*), which he put forward in 1893. By means of this theory not only was a simple method of classifying complex inorganic compounds made available, but new and unsuspected cases of geometrical and optical isomerism were brought to light. (*See* ISOMERISM.) Although Werner's views met with some opposition and had to be modified slightly they undoubtedly gave a great stimulus to the development of certain branches of chemistry. Attempts are being made to bring the theory into line with the modern views on the structure of the atom. (*See* N. V. Sidgwick, *The Electronic Theory of Valency*, 1927.)

Werner wrote *Neuere Anschauungen auf dem Gebiet der anorgan Chemie;* it has been translated into English. *See* obituary notice in *Jour. Chem. Soc.*, p. 1639 (1920).

WERNHER, SIR JULIUS CHARLES, 1ST BART. (1850–1912), British South African financier, was born at Darmstadt in 1850. After working as a clerk in Frankfurt and London, he entered the German army on the outbreak of the Franco-German war. He was sent to Kimberley in 1871 by Jules Porges, diamond merchant, and eventually became a partner in the firm, returning to London in 1880 as British representative. In 1888 he became a life governor of the De Beers Corporation. Beit (*q.v.*) was now a member of the firm, and in 1889 when Porges retired the name of the firm was changed to Wernher, Beit & Co. Sir Julius Wernher, who was created a baronet in 1905, spent large sums on public objects, including education. He gave £10,000 to the National Physical Laboratory and, with Beit, endowed the South African university with £500,000. He died in London on May 21, 1912.

WERNIGERODE, a town in Prussian Saxony, on the north slopes of the Harz mts. Pop. (1925) 20,163.

The counts of Wernigerode, who can be traced back to the early 12th century, were successively vassals of the margraves of Brandenburg (1268) and the archbishops of Magdeburg (1381). On the extinction of the family in 1429 the county fell to the counts of Stolberg. The latter surrendered its military and fiscal independence to Prussia in 1714.

WESEL, JOHANN RUCHRAT VON (d. 1481), German theologian, was born at Oberwesel early in the 15th century. He appears to have been one of the leaders of the humanist movement in Germany, and to have had some intercourse and sympathy with the leaders of the Hussites in Bohemia. Erfurt was in his day the headquarters of a humanism which was both devout and opposed to the realist metaphysic and the Thomist theology which prevailed in the universities of Cologne and Heidelberg. Wesel was one of the professors at Erfurt between 1445 and 1456, and was vice-rector in 1458. In 1460 he was appointed preacher at Mainz, in 1462 at Worms, and in 1479, when an old and worn-out man, he was brought before the Dominican inquisitor Gerhard Elten of Cologne. The charges against him were chiefly based on a treatise, *De indulgentiis,* which he had composed while at Erfurt twenty-five years before. He had also written *De potestate ecclesiastica.* He died under sentence of imprisonment for life in the Augustinian convent in Mainz in 1481.

The best account of Wesel is to be found in K. Ullmann's *Reformers before the Reformation.* His tract on *Indulgences* is published in Walch's *Monumenta Medii Aevi,* vol. i., while a report of his trial is given in Ortuin Gratius's *Fasciculus rerum expetendarum et fugiendarum* (ed. by Browne, London, 1690), and d'Argentré's *Collectio judiciorum de novis erroribus* (Paris, 1728). *See* also Otto Clemen's art. in Herzog-Hauck's *Realencyklopädie für prot. Theologie und Kirche* (3rd ed., Leipzig, 1908), xxi. 127.

WESEL, a town in the Prussian Rhine province at the confluence of the Rhine and the Lippe, 46 m. S.W. of Münster and 35 m. N.W. of Duisburg. Pop. (1925) 24,027. Wesel, formerly known as Lippemünde, was one of the points from which Charlemagne directed his operations against the heathen Saxons. Incorporated in 1241, it became a flourishing commercial town, and though repeatedly subject to the counts of Cleves, was a member of the Hanseatic League, and as late as 1521 a free imperial city. It was occupied by the Spaniards, the Dutch and the French in turn, and was ceded to Prussia in 1814. There is a junction of seven railway lines and it is also a centre for river traffic. Wesel contains some quaint old houses, and a town hall dating from 1396, with an elaborate façade, and containing a valuable old silver plate.

WESER, one of the chief rivers of Germany, 440 m. long, formed by the union of the Werra and the Fulda at Münden, flowing generally north and entering the North sea below Bremerhaven, between Jade bay and the estuary of the Elbe.

The Weser on the whole is shallow, and navigation above Bremen is sometimes interrupted by drought. The fairway up to Bremen has a minimum depth of 18 ft. Boats of 350 tons can ascend generally as far as Münden. A system of waterways connects the estuary with that of the Elbe; a canal between the Hunte and the Leda gives connection with the Ems. Above Bremen the navigation, which is interrupted by occasional rapids, is assisted by locks and weirs. The Werra and Fulda are both navigable when they unite to form the Weser, the Fulda being canalized between Cassel and Fulda, the Aller, Wümme, Geeste and Hunte are also navigable. Below the junction of the Hunte the Weser, hitherto a single stream is divided into several channels by islands. The principal town on the Weser is Bremen.

WESLEY (Family). The Wesley family sprang from Welswe, near Wells in Somerset. Their pedigree has been traced back to Guy, whom Athelstan made a thane about 938. One branch of the family settled in Ireland. Sir Herbert Westley of Westleigh, Devon, married Elizabeth Wellesley of Dangan in Ireland. Their third son, Bartholomew, studied both medicine and theology at Oxford, and, in 1619, married the daughter of Sir Henry Colley of Kildare. In 1660 he held the rectories of Catherston and Charmouth in Dorset valued at £35, 10s. per annum. He was ejected in 1662 and gained his living as a doctor. He was buried at Lyme Regis on Feb. 15, 1670.

His son, John Westley, grandfather of the founder of Methodism, was born in 1636 and studied at New Inn Hall, Oxford, where he became proficient in Oriental languages and won the special regard of John Owen, then vice-chancellor. Cromwell's Triers approved him as minister of Winterborn-Whitchurch, Dorset, in 1658. The following year he married the daughter of John White, the patriarch of Dorchester. In 1661 he was committed to prison for refusing to use the Book of Common Prayer. His candour and zeal made a deep impression on Gilbert Ironside the elder, Bishop of Bristol, with whom he had an interview. He was ejected in 1662 and became a Nonconformist pastor at Poole. He died in 1678; his widow survived him for 32 years. One of his sons, Matthew, became a surgeon in London, where he died in 1737.

Another son, Samuel, was trained in London for the Nonconformist ministry, but changed his views, and, in Aug. 1683, entered Exeter college, Oxford, as a sizar. He dropped the "t" in his name and returned to what he said was the original spelling, Wesley. In 1689 he was ordained and married Susanna, youngest daughter of Dr. Samuel Annesley, vicar of St. Giles, Cripplegate, and nephew of the 1st earl of Anglesea. Annesley gave up his living in 1662, and formed a congregation in Little St. Helen's, Bishopsgate. Samuel Wesley was appointed rector of South Ormsby in 1691, and moved to Epworth in 1697. He had 19 children, of whom eight died in infancy. His lawless parishioners could not endure his faithful preaching, and in 1705 he was confined in Lincoln castle for a small debt. Two-thirds of his parsonage was destroyed by fire in 1702 and in 1709 it was burnt to the ground. He managed to rebuild the rectory, but his resources were so heavily strained that 13 years later it was only half furnished. Samuel Wesley wrote a *Life of Christ* in verse (1693), *The History of the Old and New Testament in Verse* (1701?), a noble *Letter to a Curate,* full of strong sense and ripe experience, and *Dissertations on the Book of Job* (1735). He died at Epworth in 1735. Susanna Wesley died at the Foundry, London, in 1742 and was buried in Bunhill Fields.

Their eldest son, Samuel Wesley (1690–1739), was born in London, entered Westminster school in 1704, became a Queen's scholar in 1707 and in 1711 went up to Christ Church, Oxford. He returned to Westminster as head usher, took orders and enjoyed the intimate friendship of Bishop Atterbury, Harley earl of Oxford, Addison, Swift and Prior. He became headmaster of Blundell's school at Tiverton in 1732 and died there on Nov. 6, 1739. He was a finished classical scholar, a poet and a devout man, but he was never reconciled to the Methodism of his brothers. His poems, published in 1736, reached a second edition in 1743, and were reprinted with new poems and a *Life* by W. Nichols (1862).

Charles Wesley (1707–1788) was the 18th child of the Rector of Epworth, and was saved from the fire of 1709 by his nurse. He entered Westminster school in 1716, became a King's Scholar and was captain of the school in 1725. He was a plucky boy, and won the life-long friendship of the future earl of Mansfield by fighting battles on his behalf. Garret Wesley of Ireland wished to adopt his young kinsman, but this offer was declined and the estates were left to Richard Colley on condition that he assumed the name Wesley. Charles Wesley was elected to Christ Church in 1726. John had become fellow of Lincoln the previous March. Charles lost his first 12 months at Oxford in "diversions," but whilst John was acting as their father's curate, his brother "awoke out of his lethargy." He persuaded two or three other students to go with him to the weekly sacrament. This led a young gentleman of Christ Church to exclaim: "Here is a new set of Methodists sprung up." The name quickly spread through the university, and Oxford Methodism began its course. In 1735 Charles Wesley was ordained and went with his brother to Georgia as secretary to Colonel, afterwards General, Oglethorpe, the Governor. The work proved uncongenial, and after enduring many hardships his health failed and he left Frederica for England on July 26, 1736. He hoped to return, but in Feb. 1738 John Wesley came home, and Charles found that his state of health made it necessary to resign his secretaryship. After his evangelical conversion on Whit Sunday (May 21, 1738), he became the poet of the Revival.

He wrote about 6,500 hymns. They vary greatly in merit, but Canon Overton held him, taking quantity and quality into consideration, to be "the great hymn-writer of all ages." Their early volumes of poetry bear the names of both brothers, but it is generally assumed that the original hymns were by Charles and the translations by John Wesley. For some years Charles Wesley took a full share in the hardships and perils of the Methodist itinerancy, and was often a remarkably powerful preacher. After his marriage in 1749 his work was chiefly confined to Bristol, where he then lived, and London. He moved to London in 1771 and died in Marylebone on March 29, 1788. He was strongly opposed to his brother's ordinations, and refused to be buried at City Road, because the ground there was unconsecrated. He was buried in the graveyard of Marylebone Old Church.

Charles Wesley married Sarah Gwynne, daughter of a Welsh magistrate living at Garth, on April 8, 1749. She died in 1822 at the age of ninety-six. Five of their children died as infants and are buried in St. James's Churchyard, Bristol. Their surviving daughter Sarah, who was engaged in literary work, died unmarried in 1828. Charles Wesley, Jr. (1759–1834), was organist of St. George's, Hanover Square. He published *Six Concertos for the Organ and Harp* in 1778. He also died unmarried. Samuel, the younger brother (1766–1837) (*q.v.*), was even more gifted than Charles as an organist and composer; he was also a lecturer on musical subjects. Two of his sons were Dr. Wesley, sub-dean of the Chapel Royal, and Dr. Samuel Sebastian Wesley (*q.v.*) (1810–1876), the famous organist of Gloucester cathedral.

BIBLIOGRAPHY.—A volume of Charles Wesley's sermons with memoir appeared in 1816; Lives by Thomas Jackson (1841) and John Telford (1886); Journal and Letters with Notes by Thomas Jackson (1849); *The Early Journal* (1736–39) with additional matter (1910); *Poetical Works of John and Charles Wesley* (13 vols., 1868); *Methodist Hymn Book Illustrated* by J. Telford (1906); Adam Clarke's *Memoirs of the Wesley Family* (1822); Dove's *Biographical History of the Wesley Family* (1832); G. J. Stevenson, *Memorials of the Wesley Family* (1876); Tyerman's *Life and Times of Samuel Wesley, M.A.* (1866).
(J. TE.)

WESLEY, JOHN (1703–1791), English divine, was born at Epworth Rectory on June 17th (O.S.) 1703. He was the 15th child of Samuel and Susanna Wesley. (*See* WESLEY FAMILY.) His mother's training laid the foundation of his character, and under her instruction the children made remarkable progress. On Feb. 9, 1709, the rectory was burnt down, and the children had a narrow escape. On the duke of Buckingham's nomination, Wesley was for six years a pupil at Charterhouse. In June 1720 he went up to Christ Church, Oxford, with an annual allowance of £40 as a Charterhouse scholar. His health was poor and he found it hard to keep out of debt, but he made good use of his opportunities. A scheme of study which he drew up for 1722 with a time-table for each day of the week is still to be seen in his earliest diary.

The standard edition of *Wesley's Journal* (1909) has furnished much new material for this period of Wesley's life, Curnock having unravelled the difficult cipher and shorthand in which Wesley's early diaries were kept. He reached the conclusion that the religious friend who directed Wesley's attention to the writings of Thomas à Kempis and Jeremy Taylor, in 1725, was Miss Betty Kirkham, whose father was rector of Stanton in Gloucestershire. Wesley frankly disclaimed inward holiness.

He was ordained deacon on Sept. 19, 1725, and admitted to priest's orders on Sept. 22, 1728. In 1726 he had been fellow of Lincoln. His private diaries, seven of which are in the hands of Mr. Russell J. Colman of Norwich, contain monthly reviews of Wesley's reading. It covered a wide range, and he made careful notes and abstracts of it. He generally took breakfast or tea with some congenial friend and delighted to discuss the deepest subjects. At the coffee house he saw the *Spectator* and other periodicals. He loved riding and walking and was an expert swimmer.

He preached frequently in the churches near Oxford in the months succeeding his ordination, and in April 1726 he obtained leave from his college to act as his father's curate. The new material in the *Journal* describes the simple manner of his life. He read plays, attended the village fairs, shot plovers in the fenland, and enjoyed a dance with his sisters. In October he returned to Oxford, where he was appointed Greek lecturer and moderator of the classes. He gained considerable reputation in the disputation for his master's degree in February 1727. He was now free to follow his own course of studies and began to lose his love for company, unless it were with those who were drawn like himself to religion. In August he returned to Lincolnshire, where he assisted his father till Nov. 1729. During those two years he paid three visits to the university. In the summer of 1729 he was up for two months. Almost every evening found him with the little society which had gathered round Charles.

The Holy Club.—When he came into residence in November he was recognized as the father of the Holy Club. It met at first on Sunday evenings, then every evening was passed in Wesley's room or that of some other member. They read the Greek Testament and the classics; fasted on Wednesday and Friday; received the Lord's Supper every week; and brought all their life under review. In 1730 William Morgan, an Irish student, visited the gaol and reported that there was a great opening for work among the prisoners. The friends agreed to visit the Castle twice a week and to look after the sick in any parish where the clergyman was willing to accept their help. Wesley's spirit at this time is seen from his sermon on "The Circumcision of the Heart," preached before the university on January 1, 1733. In 1765 he said it "contains all that I now teach concerning salvation from all sin, and loving God with an undivided heart." Wesley rose at four, lived on £28 a year and gave away the remainder of his income. William Law's books impressed him and on his advice the young tutor began to read mystic authors, but he soon laid them aside.

Wesley had not yet found the key to the heart and conscience of his hearers. He says, "From the year 1725 to 1729, I preached much, but saw no fruit to my labour. Indeed it could not be that I should; for I neither laid the foundation of repentance nor of preaching the Gospel, taking it for granted that all to whom I preached were believers, and that many of them needed no repentance. From the year 1729 to 1734, laying a deeper foundation of repentance, I saw a little fruit. But it was only a little; and no wonder; for I did not preach faith in the blood of the covenant. From 1734 to 1738, speaking more of faith in Christ, I saw more fruit of my preaching." Looking back on these days in 1777, Wesley felt "the Methodists at Oxford were all one body, and, as it were, one soul; zealous for the religion of the Bible, of the Primitive Church, and, in consequence, of the Church of England; as they believed it to come nearer the scriptural and primitive plan than any other national church upon earth." The number of Oxford Methodists was small and probably never exceeding twenty-five. John Clayton, James Hervey, Benjamin Ingham and Thomas Broughton, were members of the Holy Club, and George Whitefield joined it on the eve of the Wesley's departure for Georgia.

Mission to Georgia.—Wesley's father died on April 25, 1735, and in the following October John and Charles took ship for Georgia, with Benjamin Ingham and Charles Delamotte. John was sent out by the Society for the Propagation of the Gospel, and hoped to labour as a missionary among the Indians, but though he had many interesting conversations with them the mission was found to be impracticable. The cabin of the "Simmonds" became a study for the four Methodists. The calm confidence of their Moravian fellow-passengers amid the Atlantic storms convinced Wesley that he did not possess the faith which casts out fear. Closer acquaintance with these German friends in Savannah deepened the impression. Wesley needed help, for he was beset by difficulties. Mrs. Hawkins and Mrs. Welch poisoned the mind of Colonel Oglethorpe against the brothers for a time. Wesley's attachment to Miss Hopkey also led to much pain and disappointment. All this is now seen more clearly in the standard edition of the *Journal*. Wesley was a stiff High Churchman, who scrupulously followed every detail of the rubrics. He insisted on baptizing children by trine immersion, and refused the Communion to a pious German because he had not been baptized by a minister who had been episcopally ordained. At the same time he was accused of "introducing into the church and service at the altar compositions of psalms and hymns not inspected or

authorized by any proper judicature." The list of grievances presented by Wesley's enemies to the Grand Jury at Savannah gives abundant evidence of his unwearying labours for his flock.

The foundation of his future work as the father of Methodist hymnody was laid in Georgia. His first *Collection of Psalms and Hymns* (Charlestown, 1737) contains five of his incomparable translations from the German, and on his return to England he published another *Collection* in 1738, with five more translations from the German and one from the Spanish. In April 1736 Wesley formed a little society of thirty or forty of the serious members of his congregation. He calls this the second rise of Methodism, the first being at Oxford in November 1729. The company in Savannah met every Wednesday evening "in order to a free conversation, begun and ended with singing and prayer." A select company of these met at the parsonage on Sunday afternoons. In 1781 he writes, "I cannot but observe that these were the first rudiments of the Methodist societies."

In the presence of such facts we can understand the significance of the mission to Georgia. Wesley put down many severe things against himself on the return voyage, and he saw afterwards that even then he had the faith of a servant though not that of a son. In London he met Peter Böhler who had been ordained by Zinzendorf for work in Carolina. By Böhler Wesley was convinced that he lacked "that faith whereby alone we are saved." On Wednesday, May 24, 1738, he went to a society meeting in Aldersgate Street where Luther's *Preface to the Epistle to the Romans* was being read. "About a quarter before nine, while he was describing the change which God works in the heart through faith in Christ, I felt my heart strangely warmed. I felt I did trust in Christ, Christ alone, for salvation; and an assurance was given me that he had taken away *my* sins, even *mine*, and saved *me* from the law of sin and death." Mr. Lecky points out the significance of that event. "It is scarcely an exaggeration to say that the scene which took place at that humble meeting in Aldersgate Street forms an epoch in English history. The conviction which then flashed upon one of the most powerful and most active intellects in England is the true source of English Methodism" (*History of England in Eighteenth Century*, ii. 558).

Wesley spent some time during the summer of 1738 in visiting the Moravian settlement at Herrenhut and returned to London on Sept. 16, 1738, with his faith greatly strengthened. He preached in all the churches that were open to him, spoke in many religious societies, visited Newgate and the Oxford prisons. On New Year's Day, 1739, the Wesleys, Whitefield and other friends had a Love Feast at Fetter Lane. In February Whitefield went to Bristol, where his popularity was unbounded. When the churches were closed against him he spoke to the Kingswood colliers in the open air, and after six memorable weeks wrote urging Wesley to come and take up the work. Wesley was in his friend's congregation on April 1, but says, "I could scarcely reconcile myself to this strange way of preaching in the fields . . . having been all my life (till very lately) so tenacious of every point relating to decency and order, that I should have thought the saving of souls almost a sin, if it had not been done in a church." Next day Wesley followed Whitefield's example. His fears and prejudices melted away as he discerned that this was the very method needed for reaching the multitudes.

Foundation of the "Society."—On May 1, 1738, he wrote in his journal: "This evening our little society began, which afterwards met in Fetter Lane." Among its "fundamental rules" we find a provision for dividing the society into bands of five or ten persons who spoke freely and plainly to each other as to the "real state" of their hearts. The bands united in a conference every Wednesday evening. The society first met at James Hutton's shop, "The Bible and Sun," Wild Street, west of Temple Bar. About Sept. 25, it moved to Fetter Lane. Wesley describes this as the third beginning of Methodism. After the field preaching began converts multiplied. They found all the world against them, and Wesley advised them to strengthen one another and talk together as often as they could. When he tried to visit them at their homes he found the task beyond him, and therefore invited them to meet him on Thursday evenings. This meeting was held in the end of 1739 at the Foundry in Moorfields which Wesley had just secured as a preaching place. Grave disorders had arisen in the society at Fetter Lane, and on July 23, 1740, Wesley withdrew from it. About 25 men and 48 women also left and cast in their lot with the society at the Foundry. The centenary of Methodism was kept in 1839.

Wesley's headquarters at Bristol were in the Horse Fair, where a room was built in May 1739 for two religious societies which had been accustomed to meet in Nicholas Street and Baldwin Street. To meet the cost of this Captain Foy suggested that each member should give a penny per week. When it was urged that some were too poor to do this, he replied, "Then put eleven of the poorest with me; and if they can give anything, well: I will call on them weekly, and if they can give nothing I will give for them as well as for myself." Others followed his example and were called leaders, a name given as early as Nov. 5, 1738, to those who had charge of the bands in London. Wesley saw that here was the very means he needed to watch over his flock. The leaders thus became a body of lay pastors. Those under their care formed a class. It proved more convenient to meet together and this gave opportunity for religious conversation and prayer. As the society increased Wesley found it needed "still greater care to separate the precious from the vile." He therefore arranged to meet the classes himself every quarter and gave a ticket "under his own hand" to every one "whose seriousness and good conversation" he found no reason to doubt. The ticket furnished an easy means for guarding the meetings of the society against intrusion. "Bands" were formed for those who wished for closer communion. Love-feasts for fellowship and testimony were also introduced, according to the custom of the primitive church. Watch-nights were due to the suggestion of a Kingswood collier in 1740.

Wesley issued the rules of the united societies in February 1743. Those who wished to enter the society must have "a desire to flee from the wrath to come, to be saved from their sins." When admitted they were to give evidence of their desire for salvation "by doing no harm; by doing good of every possible sort; by attending upon all the means of grace." It was expected that all who could do so would contribute the penny a week suggested in Bristol, and give a shilling at the renewal of their quarterly ticket. Wesley had at first to take charge of the contributions, but as they grew larger he appointed stewards to receive the money, to pay debts, and to relieve the needy. The memorable arrangement in Bristol was made a few weeks before Wesley's field of labour was extended to the north of England in May 1742. He found Newcastle ripe for his message. English Christianity seemed to have no power to uplift the people. Dram-drinking was an epidemic. Freethinkers' clubs flourished.

The doctrine of election had led to a temporary separation between Whitefield and the Wesleys in 1741. Wesley believed that the grace of God could transform every life that received it. He preached the doctrine of conscious acceptance with God and daily growth in holiness. Victory over sin was the goal which he set before all his people. He made his appeal to the conscience in the clearest language, with the most cogent argument and with all the weight of personal conviction. Hearers like John Nelson felt as though every word was aimed at themselves. No preacher of the century had this mastery over his audience. His Evangelical Arminianism is shown in his four volumes of sermons and his *Notes on the New Testament*.

Itinerary Work.—Up till 1742 Wesley's work was chiefly confined to London and Bristol, with the adjacent towns and villages or the places which lay between them. On his way to Newcastle that year Wesley visited Birstal, where John Nelson, the stonemason, had already been working. On his return he held memorable services in the churchyard at Epworth. Methodism this year spread out from Birstal into the West Riding. Societies were also formed in Somerset, Wilts, Gloucestershire, Leicester, Warwickshire, Nottinghamshire and the south of Yorkshire. In the summer Charles Wesley visited Wednesbury, Leeds and Newcastle. Next year he took Cornwall by storm. The work in London was prospering. In 1743 Wesley secured a west-end centre at West

Street, Seven Dials, which for fifty years had a wonderful history. In August 1747 Wesley paid his first visit to Ireland, where he had such success that he gave more than six years of his life to the country and crossed the Irish Channel forty-two times. Ireland has now its own conference presided over by a delegate from the British conference. Wesley's first visit to Scotland was in 1751. In all, he paid 22 visits.

Such extension of his field would have been impossible had not Wesley been helped by a heroic band of preachers. Wesley says: "Joseph Humphreys was the first lay preacher that assisted me in England, in the year 1738." That was probably help in the Fetter Lane Society, for Wesley then had no preaching place of his own. John Cennick, the hymn-writer and schoolmaster at Kingswood, began to preach there in 1739. Thomas Maxwell, who was left to meet and pray with the members at the Foundry during the absence of the Wesleys, began to preach. Wesley hurried to London to check this irregularity, but his mother urged him to hear Maxwell for himself, and he soon saw that such assistance was of the highest value. The autobiographies of these early Methodist preachers are among the classics of the Evangelical Revival. As the work advanced Wesley held a conference at the Foundry in 1744. Besides himself and his brother, four other clergymen were present and four "lay brethren." It was agreed that "lay assistants" were allowable, but only in cases of necessity. This necessity grew more urgent every year as Methodism extended. One of the preachers in each circuit was the "assistant," who had general oversight of the work, the others were "helpers." The conference became an annual gathering of Wesley's preachers.

In the early conversations doctrine took a prominent place, but as Methodism spread the oversight of its growing organization occupied more time and more attention. In February 1784 Wesley's deed of declaration gave the conference a legal constitution. He named one hundred preachers who after his death were to meet once a year, fill up vacancies in their number, appoint a president and secretary, station the preachers, admit proper persons into the ministry, and take general oversight of the societies. In October 1768, a Methodist chapel was opened in New York. At the conference of 1769 two preachers, Richard Boardman and Joseph Pilmoor, volunteered to go out to take charge of the work. In 1771, Francis Asbury, the Wesley of America, crossed the Atlantic. Methodism grew rapidly, and it became essential to provide its people with the sacraments. In September 1784 Wesley ordained his clerical helper, Dr. Coke, superintendent (or bishop), and instructed him to ordain Asbury as his colleague. Richard Whatcoat and Thomas Vasey were ordained by Wesley, Coke and Creighton to administer the sacraments in America. Wesley had reached the conclusion in 1746 that bishops and presbyters were essentially of one order. (*See* METHODISM: *United States.*)

He told his brother in 1785: "I firmly believe that I am a scriptural επισκοπος as much as any man in England or in Europe; for the uninterrupted succession I know to be a fable, which no man ever did or can prove." Other ordinations for the administration of the sacraments in Scotland, the colonies and England followed. The interests of his work stood first with Wesley. He did everything that strong words against separation could do to bind his societies to the Church of England; he also did everything that legal documents and ordinations could do to secure the permanence of that great work for which God had raised him up. In the words of Canon Overton and Rev. F. H. Relton (*Hist. of Eng. Ch.* 1714–1800): "It is purely a modern notion that the Wesleyan movement ever was, or ever was intended to be, except by Wesley, a church movement." Despite his strong sayings, it was Wesley who broke the links to the church, for, as Lord Mansfield put it, "ordination is separation."

Wesley's account of his itinerancy is given in his famous *Journal*, of which the first part appeared about 1739. Mr. Birrell has called it "the most amazing record of human exertion ever penned by man." The development of his work made a tremendous strain upon Wesley's powers. He generally travelled about 5,000 miles a year and preached fifteen sermons a week. His rule was always to look a mob in the face.

Wesley's writings did much to open the eyes of candid men to his motives and his methods. Besides the incomparable *Journal*, his *Appeals to Men of Reason and Religion* also produced an extraordinary effect in allaying prejudice and winning respect. He constantly sought to educate his own people. No man in the 18th century did so much to create a taste for good reading and to supply it with books at the lowest prices. Sir Leslie Stephen pays high praise to Wesley's writings, which went "straight to the mark without one superfluous flourish." As a social reformer Wesley was far in advance of his time. He provided work for the deserving poor, supplied them with clothes and food in seasons of special distress. The profits on his cheap books enabled him to give away as much as £1,400 a year. He established a lending stock to help struggling business men and did much to relieve debtors who had been thrown into prison. He opened dispensaries in London and Bristol and was keenly interested in medicine.

Wesley's supreme gift was his genius for organization. He was by no means ignorant of this. "I know this is the peculiar talent which God has given me." Wesley's special power lay in his quickness to avail himself of circumstances and of the suggestions made by those about him. The class-meeting, the love-feast, the watch-night, the covenant service, leaders, stewards, lay preachers, all were the fruit of this readiness to avail himself of suggestions made by men or events.

In 1751 Wesley married Mary Vazeille, a widow, but the union was unfortunate and she finally left him. John Fletcher, the vicar of Madeley, to whom Wesley had turned as a possible successor, died in 1785. He had gone to Wesley's help at West Street after his ordination at Whitehall in 1757 and had been one of his chief allies ever since. He was beloved by all the preachers, and his *Checks to Antinomianism* show that he was a courteous controversialist. Charles Wesley died three years after Fletcher. During the last three years of his life John Wesley was welcomed everywhere. His visits were public holidays.

Wesley preached his last sermon in Mr. Belson's house at Leatherhead on Wednesday, Feb. 23, 1791; wrote next day his last letter to Wilberforce, urging him to carry on his crusade against the slave trade; and died in his house at City Road on March 2, 1791, in his eighty-eighth year. He was buried on March 9, in the graveyard behind City Road chapel. (J. TE.)

BIBLIOGRAPHY.—The standard edition of the *Journal*, enlarged from the original mss., with notes from Wesley's unpublished diaries, etc., was edited by N. Curnock (8 vols., 1909–16). The standard life of Wesley is J. S. Simon's *John Wesley, the Master Builder* (1927). Wesley's *Standard Sermons* were edited by E. H. Sugden (1921). *See* also W. A. Gifford, *John Wesley: Patriot and Statesman* (1922); J. H. Holmes, *John Wesley and the Methodist Revolt* (1923); F. L. Barber, *The Philosophy of John Wesley* (1923); J. WESLEY, SAMUEL (1766–1837), English musical composer, son of Charles Wesley, was born at Bristol, Feb. 24, 1766. Though suffering for many years from an accidental injury to the brain, Wesley was one of the most brilliant organists and most accomplished extemporaneous performers of his time. He may indeed be regarded as the father of modern English organ-playing, for he it was who, aided by his friends Benjamin Jacob and C. F. Horn, first introduced the works of Sebastian Bach to English organists, not only by his superb playing, but by editing with Horn, in 1810, the first copy of *Das wohltemperirte Clavier* ever printed in England. Wesley died on Oct. 11, 1837, leaving a vast number of ms. and printed compositions.

WESLEY, SAMUEL SEBASTIAN (1810–1876), English composer and organist, natural son of Samuel Wesley, the eminent composer, was born in London on Aug. 14, 1810. He was one of the Children of the Chapel Royal from 1819, held various unimportant posts as organist from the age of fifteen and later on in 1832 he was appointed to Hereford Cathedral. He was successively organist at Exeter Cathedral, Leeds parish church, Winchester and Gloucester Cathedrals. He again conducted the Three Choirs Festivals of 1865, 1868, 1871 and 1874. A civil list pension

of £100 a year was conferred on him in 1873; he died at Gloucester on the 19th of April 1876, and was buried at Exeter. Wesley was the first English organist of his day. As a composer he is still highly esteemed for the dignity and beauty of his anthems, the finest of which are "Blessed be the God and Father," "The Wilderness," "Ascribe unto the Lord" and "O Lord, Thou art my God." His service in E, published with a rather trenchant preface in 1845, became widely known.

WESLEYAN METHODIST CHURCH, one of the chief branches of Methodism. *See* METHODISM and WESLEY, JOHN.

In 1790 there were 294 preachers and 71,668 members in Great Britain, 19 missionaries and 5,300 members on the mission stations; 198 preachers and 43,265 members in the United States. The crisis was serious. The large proportion of Wesley's members had been taught to observe the sacraments and desired that provision should be made to administer them in their chapels. But on May 4, 1791, eighteen laymen met at Hull and expressed their conviction that the usefulness of Methodism would be promoted by its continued connection with the Church of England. A trenchant reply was prepared by Alexander Kilham (*q.v.*), one of the younger Methodist preachers.

The conference met in Manchester on the 26th of July, 1791. A letter from Wesley (dated Chester, April 7, 1785) was read, beseeching the members of the Legal Conference not to use their powers for selfish ends but to be absolutely impartial in stationing the preachers, selecting boys for education at Kingswood School, and disposing of connectional funds. The conference at once resolved that all privileges conferred by Wesley's Poll Deed should be accorded to every preacher in full connection. To supply the lack of Wesley's supervision the circuits were now grouped together in districts. As to the sacraments and the relations of Methodism to the Church of England the decision was: "We engage to follow strictly the plan which Mr. Wesley left us." This was ambiguous and was interpreted variously. Some held that it forbade the administration of the sacraments except where they were already permitted; others maintained that it left Methodism free to follow the leadings of Providence.

The conference of 1792 was so much perplexed that it resorted to the casting of lots. The decision was thus reached that the sacraments should not be administered that year. This was really shelving the question, but it gave time for opinion to ripen, and in 1793 it was resolved by a large majority that "the societies should have the privilege of the Lord's Supper where they unanimously desired it." In 1794, this privilege was definitely granted to ninety-three societies. The feeling in Bristol was very strong. The trustees of Broadmead, who were opposed to the administration of the sacrament by the preachers, forbade Henry Moore to occupy that pulpit. Nearly the whole society thereupon withdrew to Portland Chapel. The conference of 1795 had to deal with this controversy. It prepared a "Plan of Pacification" which was approved by the conference and by an assembly of trustees, and was welcomed by the societies. The Lord's Supper, baptism, the burial of the dead and service in church hours were not to be conducted by the preachers unless a majority of the trustees, stewards and leaders of any chapel approved, and assured the conference that no separation was likely to ensue. The consent of conference had to be given before any change was made.

In 1796, Alexander Kilham, who refused to abstain from agitation for further reform, and accused his brethren of priestcraft, was expelled from their ranks and the New Connection was formed with 5,000 members (*see* METHODIST NEW CONNECTION). The conference of 1797 set itself to remove any ground for distrust among the societies and to enlist their hearty support in all branches of the work. Annual accounts were to be published of various funds. The Circuit Quarterly Meeting had to approve the arrangements for the support of the preachers. Local preachers had to be accepted by the local preachers' meeting, and the powers of trustees of chapels were considerably extended. The constitution of Methodism thus practically took the shape which it retained till the admission of lay representatives to conference in 1878. No period in the history of Methodism was more critical than this, and in none was the prudence and good sense of its leaders more conspicuous. Advance was quietly made along the lines now laid down. The preachers had agreed in 1793 that all distinction between those whom Wesley had ordained and their brethren should cease. In the minutes of conference for 1818 "Rev." appears before the names of preachers who were members of the Missionary Committee. Jabez Bunting (*q.v.*), who had become the acknowledged leader of the conference, wished to have its young ministers set apart by the imposition of hands, but this scriptural custom was not introduced till 1836. The introduction of laymen into the Wesleyan Conference in 1878 was commemorated by a Thanksgiving Fund of £297,500.

Meanwhile, Methodism was growing into a great missionary church. Its work in the West Indies was firmly established in Wesley's lifetime. In 1786 eleven hundred negroes were members of the society in Antigua. The burden of superintending these missions and providing funds for their support rested on Dr. Coke, who took his place as the missionary bishop of Methodism. In 1813 he prevailed on the conference to sanction a mission to Ceylon. He sailed with six missionaries on the 30th of December, but died in the following May in the Indian Ocean. To meet these new responsibilities a branch Missionary Society had been formed in Leeds in October 1813, and others soon sprang up in various parts of the country. Methodist Missions really date from 1786 when Dr. Coke landed at Antigua. The area of operations gradually extended. Missions were begun in Madras, at the Cape of Good Hope, in Australia, and on the west coast of Africa. Two missionaries were sent to the Friendly Islands in 1826, and in 1835 a mission was undertaken among the cannibals of Fiji, which spread and deepened till the whole group of islands was transformed. The work in China began in 1851; the Burma mission was established in 1887. The rapid progress of the Transvaal and Swaziland missions has been almost embarrassing. The Missionary Jubilee in 1863–1868 yielded £179,000 for the work abroad. As the growth of the missions permitted conferences have been formed in various countries. Upper Canada had its conference in 1834, France in 1852, Australia in 1855, South Africa in 1882. The missionary revival which marked the Nottingham Conference of 1906 quickened the interest at home and abroad and the *Foreign Field* (monthly) is prominent among missionary periodicals.

In 1834 Hoxton Academy was taken as a training place for ministers. Didsbury College was opened in 1842, Richmond in 1843. Headingley was added in 1868, Handsworth in 1881.

The Centenary of Methodism was celebrated in 1839 and £221,939 was raised as a thank-offering: £71,609 was devoted to the colleges at Didsbury and Richmond; £70,000 was given to the missionary society, which spent £30,000 on the site and building of a mission-house in Bishopsgate Within; £38,000 was set apart for the removal of chapel debts, etc.

In 1837 Methodism had nine infant schools and twenty-two schools for elder children. A grant of £5,000 was made from the Centenary Fund for the provision of Wesleyan day-schools. The conference of 1843 directed that greater attention must be given to this department, and a committee met in the following October which resolved that 700 schools should be established if possible within the next seven years, and an Education Fund raised of £5,000 a year. In 1849 the Normal Training College for the education of day-school teachers was opened in Westminster, and in 1872 a second college was opened in Battersea for schoolmistresses. Besides its day-schools, Methodism possesses the Leys School at Cambridge, Rydal Mount at Colwyn Bay and boarding-schools for boys and girls.

The Forward Movement in Methodism dates from the period of the Thanksgiving Fund. Large mission-halls have been built in the principal towns of England, Scotland and Ireland. The Forward Movement of the 'eighties will always be associated with the name of Hugh Price Hughes (*q.v.*). Village Methodism shared in the quickening which the Forward Movement brought to the large towns. Chapels which had been closed were reopened; an entrance was found into many new villages. Weak circuits were grouped together and gained fresh energy and hope by the union.

The great event of Methodist history in the present century was the Twentieth Century Fund begun by Sir Robert W. Perks

in 1898. From the total sum of £1,073,782 grants were made as follows: General Chapel Committee, £290,617; Missionary Society, £102,656; Education Committee, £193,705; Home Missions, £96,872; Children's Home, £48,436. The Royal Aquarium at Westminster was purchased and a central hall and church house as the headquarters of Methodism erected. For this object £242,206 was set apart.

WESSEL, JOHAN (*c.* 1420–1489), Dutch theologian, whose real name was Wessel (Basil) Harmens Gansfort, was born at Groningen. He was educated at the famous school at Deventer, which was under the supervision of the Brothers of Common Life, and in close connection with the convent of Mount St. Agnes at Zwolle, where Thomas à Kempis was then living. At Deventer Wessel imbibed that earnest devotional mysticism which was the basis of his theology and which drew him irresistibly, after a busy life, to spend his last days among the Friends of God in the Low Countries. From Deventer he went to Cologne and then to Paris to pursue his studies. After a visit to Rome, where he was in contact with the leading humanists he returned to Paris where he gathered round him a band of enthusiastic young students, among whom was Reuchlin. In 1475 he was at Basel and in 1476 at Heidelberg teaching philosophy in the university. After thirty years of academic life he went back to his native Groningen, and spent the rest of his life partly as director in a nuns' cloister there and partly in the convent of St. Agnes at Zwolle. His remaining years were spent amid a circle of warm admirers, friends and disciples, to whom he imparted the mystical theology, the zeal for higher learning and the deep devotional spirit which characterized his own life. He died on Oct. 4, 1489, with the confession on his lips, "I know only Jesus the crucified."

See *Vita Wesseli Groningensis,* by Albert Hardenberg, published in an incomplete form in the preface to Wessel's collected works (Amsterdam, 1614; this preface also contains extracts from the works of several writers who have given facts about the life of Wessel); K. Ullmann, *Reformers before the Reformation*—the second volume of the German edition is a second and enlarged edition of a previous work entitled *Johann Wessel, ein Vorgänger Luthers* (1834); A. Ritschl, *History of the Christian Doctrine of Justification and Reconciliation* (Edinburgh, 1872); E. W. Miller, *Wessel Gansfort; Life and Writings. Principal Works translated by J. W. Scudder* (2 vols., New York, 1917).

WESSEX, one of the kingdoms of Anglo-Saxon Britain. According to the Saxon Chronicle, it was founded by two princes, Cerdic, and Cynric his son, who landed in 494 or 495 and were followed by other settlers in 501 and 514. After several successful battles against the Welsh they became kings in 519 around the southern part of Hampshire. In 530 Cerdic and Cynric are said to have conquered the Isle of Wight, which they gave to two of their relatives, Stuf and Wihtgar. Cerdic died in 534. Cynric defeated the Britons at (Old) Salisbury in 552 and again in conjunction with his son Ceawlin at Beranburh, probably Barbury hill near Surndon, in 556. At his death in 560 he was succeeded by Ceawlin, who is mentioned by Bede as the second of the English kings to hold an *imperium* in Britain. With him we enter upon a period of more or less reliable tradition. How far the earlier part of the story deserves credence is still much debated. It is worthy of note that the dynasty claimed to be of the same origin as the royal house of Bernicia.

Whatever may be the truth about the origin of the kingdom, we need not doubt that its dimensions were largely increased under Ceawlin. In his reign the Chronicle mentions two great victories over the Welsh, one at a place called Bedcanford in 571, by which Aylesbury and the upper part of the Thames valley fell into the hands of the West Saxons, and another at Dyrham in Gloucestershire in 577, which led to the capture of Cirencester, Bath and Gloucester. Ceawlin is also said to have defeated Aethelberht at a place called Wibbandun in 568. In 592 he was expelled and died in the following year. Of his successors Ceol and Ceolwulf we know little though the latter is said to have been engaged in constant warfare. Ceolwulf was succeeded in 611 by Cynegils, whose son Cwichelm provoked a Northumbrian invasion by the attempted murder of Edwin in 626. These kings are also said to have come into collision with the Mercian king Penda, and it is possible that the province of the Hwicce (*q.v.*) was lost in their time. After the accession of Oswald, who married Cynegils's daughter, to the throne of Northumbria, both Cynegils and Cwichelm were baptized. Cynegils was succeeded in 642 by his son Cenwalh, who married and subsequently divorced Penda's sister and was on that account expelled by that king. After his return he gained a victory over the Welsh near Pen-Selwood, by which a large part of Somerset came into his hands. In 661 he was again attacked by the Mercians under Wulfhere. At his death, probably in 673, the throne is said to have been held for a year by his widow Sexburh, who was succeeded by Aescwine, 674–676, and Centwine, 676–685. According to Bede, however, the kingdom was in a state of disunion from the death of Cenwalh to the accession of Ceadwalla in 685, who greatly increased its prestige and conquered the Isle of Wight, the inhabitants of which he treated with great barbarity. After a brief reign Ceadwalla went to Rome, where he was baptized, and died shortly afterwards, leaving the kingdom to Ine. By the end of the 7th century a considerable part of Devonshire as well as the whole of Somerset and Dorset had come into the hands of the West Saxons. On the resignation of Ine, in 726, the throne was obtained by Aethelheard, apparently his brother-in-law, who had to submit to the Mercian king Aethelbald, by whom he seems to have been attacked in 733. Cuthred, who succeeded in 740, at first acted in concert with Aethelbald, but revolted in 752. At his death in 756 Sigeberht succeeded. The latter, however, on account of his misgovernment was deserted by most of the leading nobles, and with the exception of Hampshire the whole kingdom came into the hands of Cynewulf. Sigeberht, after putting to death the last of the princes who remained faithful to him, was driven into exile and subsequently murdered; but vengeance was afterwards taken on Cynewulf by his brother Cyneheard. Cynewulf was succeeded in 786 by Berhtric, who married Eadburg, daughter of the Mercian king Offa. Her murderous conduct led to the king's death in 802. Berhtric was succeeded by Ecgberht (*q.v.*), who overthrew the Mercian king Beornwulf in 825. This led to the establishment of West Saxon supremacy and to the annexation by Wessex of Sussex, Surrey, Kent and Essex.

Aethelwulf (*q.v.*), son of Ecgberht, succeeded to the throne of Wessex at his father's death in 839, while the eastern provinces went to his son or brother Aethelstan. A similar division took place on Aethelwulf's death between his two sons Aethelbald and Aethelberht, but on the death of the former in 858 Aethelberht united the whole in his own hands, his younger brothers Aethelred and Alfred renouncing their claims. Aethelberht was succeeded in 865 by Aethelred, and the latter by Alfred in 871 This was the period of the great Danish invasion which culminated in the submission of Guthrum in 878. Shortly afterwards the kingdom of the Mercians came to an end and by 886 Alfred's authority was admitted in all the provinces of England which were not under Danish rule. From this time onwards the history of Wessex is the history of England.

Plummer (Oxford, 1896); "Annales Lindisfarnenses," in the *Monumenta Germ. hist.* xix. (Hanover, 1866); Asser, *Life of King Alfred,* ed. W. H. Stevenson (Oxford, 1904); W. de G. Birch, *Cartularium Saxonicum* (London, 1885–93). (F. G. M. B.)

WEST, BENJAMIN (1738–1820), English historical and

portrait-painter, was born on Oct. 10, 1738 at Springfield, Pennsylvania, of an old Quaker family from Buckinghamshire. He showed artistic talent at an early age, and at the age of eighteen settled in Philadelphia as a portrait-painter. He then removed to New York, and in 1760, through the assistance of friends, he was enabled to visit Italy, where he remained nearly three years. On leaving Italy he settled in London as an historical painter. George III. took him under his special patronage and commissions flowed in upon him from all quarters. In 1768 he was one of the four artists who submitted to the king the plan for a royal academy, of which he was one of the earliest members; and in 1772 he was appointed historical painter to the king. He painted large pictures on historical and religious subjects, conceived, as he believed, in the style of the old masters, and so high did he stand in public favour that on the death of Sir Joshua Reynolds, in 1792, he succeeded him as president of the Academy. He died in London on March 11, 1820, and was buried in St. Paul's. West's large "Death of Wolfe" is interesting as introducing modern costume.

An account of West's life was published by Galt (*The Progress of Genius*, 1816). *See* also H. T. Tuckerman, *Book of the Artists* (N.Y., 1868).

WEST, THE, a term of special significance in the United States because the major direction of settlement has always been westward. To New Englanders at the beginning of the 19th century "west" meant western New York, and to those of the Middle Atlantic shore it meant the Ohio valley. As settlement proceeded the "west" was continually carried forward and followed the retreating frontier across the country. Before the Civil War the Mississippi valley was "west" but for the next generation this region had become the "Middle West" (*q.v.*) and a "Far West" had grown up beyond. For the characteristics of this transitory "west" and its significance in American life *see* the article THE AMERICAN FRONTIER.

Since the disappearance of a definite frontier about 1890 the use of terms has become more stable, but the West still begins in a different place for every person. For easterners it usually begins at the Mississippi river, for some others the natural place of delimitation would seem to be where the prairies blend into the plains, a line slightly beyond the western border of the first row of States west of the Mississippi. From this line to the Pacific stretch three successive geographical divisions, the plains, the mountains and the Pacific slope. The last is the oldest in settlement. Migration leaped across the arid plains and the forbidding mountains to the fertile agricultural valleys of Oregon or to the gold placers of California. It then dribbled back through the mountains separating and collecting again where ever mineral wealth was found. Lastly it spread thinly over the plains in the ranching frontier, which after 1890 was largely replaced by the denser homesteading population. The Pacific slope has come to be known as the "Coast." The real West, then, is made up of the last frontiers, the mountains and the plains. Its population is more varied in character than in any other major portion of the country. Settled during and after the Civil War by southerners, middle-westerners, and easterners, it possesses different characteristics from the older sections. Except in the few cities developed social strata are scarcely noticeable. Out of the west, or the "Coast" have come the more democratic governmental ideas, notably the initiative, referendum and recall. Wyoming as a territory provided for woman suffrage and was the first State of the Union and perhaps the first in the world to do so. Property rights of women were also early made more nearly equal to those of men. In all cultural fields, though people carried with them the ideas of their backgrounds, the lack of established traditional institutions made modification and experiment easier. Dependence on the public schools became greater as the influence of other institutions declined.

WEST AFRICA. As a geographical region West Africa may be taken to include the coast lands from Cape Blanco to the estuary of the Congo, the basins of the Niger, the Senegal and Gambia, and of the Volta and other rivers entering the Gulf of Guinea. Eastward it extends to Lake Chad, and northward it merges into the Sahara. While it includes the Cameroons and the Gabun it does not include Angola, which is properly West-Central Africa. As defined, West Africa has an area of about 3,000,000 sq.m. not reckoning the Sahara region. The population is about 40,000,000.

Physical Features.—In physical features West Africa presents a fairly simple structure. The coast makes a great bend from south to east, and then south again, but it is of a remarkably regular outline, and the only good natural harbours are in the estuaries or mouths of the rivers. A coast plain varying from a narrow strip to 50 or 60 m. deep is succeeded by an area of dense forest. In some places, as in the Niger delta, the forest comes to the water's edge and then consists of mangroves. The coast line is usually low and often ill-defined, and behind it run lagoons and creeks, so that considerable areas are forested swamp. North of the forest area the ground rises to a comparatively low plateau, forming mountain ranges parallel to the coast. In the east rise the mountains of Adamawa, which are the outliers of the plateau which there marks the limit of the Congo basin. From Adamawa a volcanic range runs south-west, culminating at the coast in Mt. Cameroon. From a submerged peninsula extending from Mt. Cameroon rise the islands of Fernando Po, Principe, St. Thomas and Annobon. From the western face of the Adamawa mountain streams descend to form the Benue. More important to hydrography of the country are the Futa Jallon mountains, which are parallel to the coast.

Climate.—The climate of the coast and forest regions is hot and excessively humid. Variations of temperature are normally not great and the average is about 80° F. The yearly rainfall is from 80 to 100 in. in most districts; in the Kasamance region of Senegal and in the Niger delta the fall is frequently 150 in. in a year. The climate of the interior is, as a rule (Senegal is an exception), hot and dry, with temperature often higher than on the coast, but with much greater daily variations. In the inland regions the rainfall is generally not above 30 in. a year, but in some places may be 60 in., while in the north—as at St. Louis, Senegal—it is but 12 inches. In the coast regions the rainy season lasts nine months or more; in the interior that is usually the length of the dry season. The difference is largely due to the fact that the coast is subject to the moisture-laden winds from the Atlantic, and that the rise to the plateau intercepts these winds, while the interior is more subject than the coast to the *harmattan,* the dry, hot wind from the desert. Malaria, dysentery and other diseases prevail, and no part of West Africa is suitable for permanent occupation by Europeans, though in some regions, such as the Bauchi plateau, whites can live.

Forest and Plain.—The great forest belt extends from the Gambia to the Congo and covers probably some 700,000 sq.m. Along the shores, lagoons and creeks there are mangrove forests, behind which are great areas of oil palms. Besides the oil palms are other palms, including the coconut palm. Other characteristic trees of the dense forest are mahogany, cedar, ebony and walnut. The rubber vine and rubber trees are abundant. In the more open forest are giant baobabs and shea butter trees, and in the north gum-yielding acacia. The open country usually begins about 7° N. latitude. Its general character is that of a granite and sandstone plateau forming undulating plains traversed by the alluvial valleys of the great rivers. West of the Niger at Timbuktu, as far as Mopti, the Niger valley is a wide, marshy, fertile plain. Within the Niger bend in the French Sudan, and east of the river to Lake Chad, are considerable areas of grassland giving pasture to large herds of cattle and flocks of sheep and goats, and much arable land. These plains cover over 1,000,000 sq.m., without reckoning the open country on the Cameroons plateau. In the extreme west, in Senegal, the country north of the Gambia is a sandy plain without surface water for eight months of the year, but with excellent pasturage after the rains. Two large regions, the French Niger Colony, which lies immediately north of (British) Nigeria, and Mauretania, the country north of the lower Senegal, which between them have an area of over 500,000 sq.m., are half or more than half Saharan in character. In small part they have cultivated land and a considerable area of pasture.

Natives and Europeans.—The vast majority of the people are of the negro race, but in the region north of the great forest belt other races have been represented from the earliest period of which there is record. Egyptian influences spread westward from the Nile valley in ancient times, and in all likelihood there were migrations of various clans. It is possible that the Fula people came originally from the East. Again the Sahara proved no barrier comparable to that of the forest zone, and Berbers from North Africa crossed the desert and settled in the region north of the lower Senegal, along the middle course of the Niger and in the Lake Chad region. Thus the negro peoples were in contact with the Mediterranean world and to some extent shared its civilization. After the Arab conquest of North Africa in the 7th century, Arab tribes settled in the Lake Chad and other districts, and the influence of Islam spread over a wide area. By the 11th century Mohammedanism had become the religion of many of the negroes, and pilgrims travelling eastwards to Mecca renewed, or strengthened, the connection of West Africa with Nubia and Egypt. Long before the rise of Islam the peoples of this northern part of West Africa, consisting largely, as has been seen, of open plains watered by large and navigable rivers, had developed well organized States, of which the oldest known, Ghana (or Ghanata), is thought to have been founded in the 3rd century A.D. Later arose the empire of Melle and the more famous and more powerful Songhoi (Songhay) empire. These were mainly west of the Niger; east of that river the Hausa—still largely pagan—founded several States and around Lake Chad grew up the powerful empire of Bornu. Marking the importance, commercial and political, of these States, large cities were founded.

The trade of all these countries was, to a small extent, eastward to the Nile valley, but chiefly across the Sahara to the Barbary States, the principal routes leading to Morocco and Tripoli. The barrier presented by the forest belt appeared almost insuperable to trade with the south, though there was some traffic with its warlike inhabitants. The routes across the Sahara were well known; along them passed great camel caravans with slaves, gold dust, ostrich feathers and leathern goods curiously wrought. The modern occupation of North Africa by European Powers, begun with the capture of Algiers by the French in 1830, did not lead to any revival of trade, partly because one of its main supports was the sale of slaves. The bringing of the western Sudan into the orbit of Western influence and the development of a new and richer commerce with the outer world was accomplished from the south, with the breaking of the barrier of the forest belt.

The inhabitants of the dense forest and of the Guinea coast had not been affected by the contact with the outer world which their northern brethren had possessed. Pure negroes, these southern folk were very primitive, nor did they develop any seafaring instinct which might have led them to the discovery of other lands. But among them the Yoruba, the Ashanti, the Dahomi and the Beni created well organized and powerful kingdoms. All the southern tribes had a profound belief in religion, chiefly shown in spirit, that is, ancestor worship and in the power of spirits to control the life of the living. In communal organization there was a thoroughly democratic element; the most powerful king was subject to the control of a council of chiefs. These peoples were made known to Europe by the discoveries of the Portuguese navigators in the 15th century, and for over 300 years their contact with the outer world was mainly through providing slaves, ivory, peppers and spices and gold to the Europeans, and getting from them gin, gunpowder and guns, beads, cotton cloths, and "Kafir truck" generally. For over a century the Portuguese were left undisturbed by European rivals on the Guinea coast, Spain not interfering, in accordance with the bull of Pope Alexander VI. of 1493 and the Treaty of Tordesillas of 1494. But after the Reformation the Protestant Powers paid no attention to the papal bull (which the Spaniards later on also disregarded). The English were among the first to challenge the Portuguese; they were trading on the Gold Coast by the middle of the 16th century, and were quickly followed by other nations, the Dutch and the French proving the most formidable. In 1642 the Portuguese were forced by the Dutch to withdraw from the Gold Coast, and thereafter, partly through inertia, they were ousted by rivals from other places until, in the end, they were able to retain only the small patch of territory known now as Portuguese Guinea.

Among the other Powers the struggle was keenest for the Gold Coast—with its double attraction of gold and slaves. Here a perfect patchwork of forts was built—Dutch, British, Danish, Swedish, even German (the Braddenburgers). It was not until late in the 19th century that the coast became definitely British. (*See* GOLD COAST.) On the Guinea Coast generally the Dutch were for a time the most powerful European State. Their power waned in the 17th century and they gave up Senegal to the French in 1678, and though Senegal was afterwards seized by the British, it became definitely French after the downfall of Napoleon. The Gambia had been contended for by British and French, the former gaining possession of the lower river. Towards the end of the 18th century the British laid the foundations of Sierra Leone, making there a home for ex-slaves; the first settlement of American negroes was made in what is now Liberia in 1821; the British acquired Lagos in 1861 as a step to ending the slave trade in the Bight of Benin, and the French claim to the Gabun had begun with the establishment in 1840 of Libreville as a home for former slaves. The Spaniards acquired the island of Fernando Po towards the end of the 18th century with settlements on the Muni river.

For a long while the European Powers established on the Guinea coast made no attempt to exercise jurisdiction outside the limits of their forts, but gradually the authority of the whites was acknowledged by the coast peoples. France was the first nation seriously to undertake the conquest of the interior. From 1854 they pushed inland from Senegal—tackling the forest belt last and mainly from the north. At that period, however, the British had begun to penetrate inland by way of the Niger and the Benue, while along the coast, apart from the French possessions, their influence was paramount, notably in the Niger delta and the Cameroons. While this influence was exercised no claim to sovereignty was made in those regions and when, in 1884–85, the "scramble" for Africa became acute, Germany was able to drive the Togoland wedge between the Gold Coast (British) and Dahomey (French) and also to secure the Cameroons. For the rest, Great Britain secured Nigeria and a fairly large area for the Gold Coast, the greater part of the hinterland falling, however, to France. (The "scramble" and partition are described in the article AFRICA.) The giving to France and Great Britain, after the World War, the mandate to administer the former German colonies, added responsibilities of those Powers in West Africa.

By the establishment of peace and by the building of railways and roads through the forest belt, and by placing steamers on the Niger and other rivers, the northern countries were at length brought into communication with the outer world by a shorter and much safer route than the Sahara, and the commerce of the Guinea coast was reinforced by the produce of the north. The great development in trade from about 1890 was due, however, to the insistent demands of European and American industry for "jungle produce," notably oil and rubber. The coast-people first, and later the tribes of the interior, were brought into ever growing contact with Western civilization.

Contact with Europeans also led to new wants, intellectual and social, and in various districts to a keen demand for education. This development took place under the guidance of French and British administrators. If Liberia be excepted, nowhere was there an independent African State left. In general the effect of the contact between the white and black was favourable to the African. What result would ultimately flow from the different systems pursued by the French and the British in their dealing with the African remained to be seen. Here only the main difference can be stated. The British, as far as possible, maintained in existence, naturally under ultimate control by the colonial administration, the native States with their own rulers, Governments and treasuries. This was the system known as indirect rule. The French governed their colonies directly, that is, European officials were everywhere in charge of the administration. Former rulers lost all attributes of sovereignty, and native chiefs, employed for purely local purposes, were, in effect, Government

officials. The French sought also to infuse French ideas into the African; the British essayed the difficult task of trying to build up a civilization which, while taking what was suitable from the West, would be essentially African.

As indicated, the greater part of West Africa belongs to France, and all the French colonies are joined one to another to form a continuous block, while each of the British protectorates is neighboured by foreign territory. Of some 3,000,000 sq.m. France administers about 2,600,000 (the Cameroons and the Gabun colony included). The British share is about 430,000 sq.m.; the negro republic of Liberia covers approximately 40,000 sq.m.; the small remainder consists of Portuguese or Spanish enclaves and a fraction of the Belgian Congo. But on the population basis the British possessions lead with roughly 21,500,000 inhabitants, while the French area has no more than 16,000,000 people. The regions most densely populated are on the coast and in the forest belt, notably the Gold Coast, Dahomey, the Niger delta and Yorubaland (while there are many large towns).

Products and Trade.—The outstanding product is oil in various forms. Besides palm oil itself, palm kernels, ground nuts, benniseed, sesame, copra and shea butter are exported for their oils. Senegal and the French Sudan, the Gambia and Northern Nigeria are conspicuous for the cultivation of the ground nut; the Ivory Coast, Sierra Leone, Dahomey, the Niger delta and the Cameroons export great quantities of palm oil and palm kernels. Other products of prime importance are cocoa, principally from the Gold Coast, which, since the World War, has become one of the main sources of the world's supply. Cocoa is also increasingly cultivated in Nigeria and the Cameroons. Cotton growing for export dates from 1905 and is likely to become important. Of sylvan products other than oil, "wild rubber" was of great value in the closing years of the 19th century and for a few years after. Since about 1910 it has been largely ousted by plantation rubber from the Far East, but in the Cameroons, the Gabun, Nigeria and elsewhere there are now rubber plantations, and plantations on a vast scale have been begun in Liberia. The export of timber is the chief industry in the Gabun and in almost all the other coast districts timber, largely mahogany, is exported. Fishing is of some account in various districts; the French have given much attention to the fishing grounds off the coast of Mauretania. The internal trade is large and active.

Mineral production, up to 1929, was almost wholly from the Gold Coast and Nigeria. In Nigeria tin and coal are extensively mined; the Gold Coast has not only its gold mines, but vast beds of manganese, which were discovered in 1914, and bauxite. The Gold Coast also produces "sand" diamonds, some 26 to the carat, which find a ready market. Gold is found in the rivers of Senegal and in Bambuk; salt comes from north-east of Timbuktu.

External trade has grown very greatly since the beginning of the 20th century, largely, if not chiefly as the result of the opening up of the country by the building of railways. In British West Africa in 1900 the trade was valued at £7,896,000; in 1927 it was valued at £63,797,000. In French West Africa, owing to the post-war fluctuations in the value of the franc and to differences in methods of returns, comparison is not so exact, but £5,000,000 for 1900 and £25,000,000 for 1927 represent approximately the volume of trade. The chief ports are Dakar (French), Freetown (Sierre Leone), Takoradi (Gold Coast), Lagos, Port Harcourt (all British) and Duala, in the Cameroons. All these have good sheltered harbours and have railway connection with the inland markets; most of the other ports are open roadsteads.

BIBLIOGRAPHY.—Annual reports on French West Africa are issued by the Colonial Office, Paris. A bibliography is given in the *Annuaire Général* (Paris, 1928 ed.); *French West Africa*, a British Foreign Office handbook (1920). For the British West African possessions see *The Dominions and Colonial Office List* (London, yearly, with lists of parliamentary papers); *The Statesman's Year Book*; the "British West African number" of *The Times* (Oct. 30, 1928); J. Hutchinson and J. M. Dalziel, *Flora of West Tropical Africa* (1928); Osman Newland, *West Africa: A Handbook of Practical Information* (1922). *See* also the articles GUINEA, FRENCH WEST AFRICA, NIGERIA, LIBERIA, GOLD COAST, SENEGAL, etc. (F. R. C.)

WESTARP, KUNO, COUNT (1864–), German politician, was born at Ludom. Aug. 12, 1864, and educated at the universities of Tübingen, Breslau, Leipzig and Berlin. He entered the civil service in 1886, becoming Director of Police in Schöneberg (1904), President of Police (1908) and Oberverwaltungsgerichtsrat (1908). In 1920, after the establishment of the German Republic, he retired. In 1908 he had entered the Reichstag as a Conservative. In 1919 he opposed the government on the question of fulfilling the terms of the Allied ultimatum. From 1925 he was chairman of the Reichstag group of the German National People's party. After the revolution the Conservative party was embodied in the Nationalist party, without entirely losing its own identity. At the beginning of 1928 it issued an appeal for votes for the candidates of a "people's National *Bloc*," in opposition to the Nationalist party candidates, together with a programme advocating the restoration of the monarchy by legal means. This action led to the resignation of Count Westarp from the leadership of the party.

WESTBOROUGH, a town of Massachusetts, U.S.A., occupying 22 sq.m. Pop. (1925) 6,348. It was the birthplace of Eli Whitney, inventor of the cotton gin. It was settled about 1659.

WEST BROMWICH, town in Staffordshire, England, 6 m. north-west of Birmingham. Pop. (1921) 73,647. Although of ancient origin, the appearance of the town, like its growth as an industrial centre of the Black Country, is modern. The church of All Saints, formerly St. Clement, was given by Henry I. to the convent of Worcester, from which it passed to the priors of Sandwell, who rebuilt it in the Decorated period, the present structure (1872) following their plan. The chief public buildings are the town hall, the Institute, the free library and law-courts. The picturesque Oak House (16th century), was opened as a museum and art gallery in 1898. There is a special school for daughters of clergymen at Sandwell Hall, a former seat of the earls of Dartmouth and at an earlier date a Benedictine priory.

WESTBROOK, a city of Maine, U.S.A. Pop. (1920) 9,453 (80% native white); 1928 local estimate 11,000. The river provides water-power, and the city manufactures paper, silks and cotton goods. Westbrook was separated from Falmouth in 1814 and incorporated as the town of Stroudwater, adopting its present name in 1815, in honour of Col. Thomas Westbrook, an Indian fighter. A charter was granted in 1889.

WESTBURY, RICHARD BETHELL, 1ST BARON (1800–73), lord chancellor of Great Britain, was the son of Dr. Richard Bethell, and was born at Bradford, Wilts., on June 30, 1800. He was educated at Wadham college, Oxford, and in 1823 was called to the bar at the Middle Temple. He was appointed vice-chancellor of Lancaster in 1851. His most important public service was the reform of the then existing mode of legal education, a reform which ensured that students before call to the bar should have at least some acquaintance with the elements of the subject which they were to profess. In 1851 he obtained a seat in the House of Commons, where he continued to sit, first as member for Aylesbury, then as member for Wolverhampton, until he was raised to the peerage. Attaching himself to the liberals, he became solicitor-general in 1852 and attorney-general in 1856 and again in 1859. On June 26, 1861, on the death of Lord Campbell, he was created lord chancellor, with the title of Baron Westbury of Westbury, county Wilts. The ambition of his life was to set on foot the compilation of a digest of the whole law, but for various reasons this became impracticable. While personal corruption is not imputed to him, he acted with some laxity, and after Parliamentary enquiries, he resigned (1865).

In 1872 he was appointed arbitrator under the European Assurance Society act 1872. Perhaps the best known of his judgments is that delivering the opinion of the judicial committee of the privy council in 1863 against the heretical character of certain extracts from *Essays and Reviews*. His principal legislative achievements were the passing of the Divorce act 1857, and of the Land Registry act 1862 (generally known as Lord Westbury's act), the latter of which in practice proved a failure. What chiefly distinguished Lord Westbury was the possession of a blistering tongue. He waged a remorseless war on the clergy in general and bishops in particular. He died on July 20, 1873, within a day of the death of Bishop Wilberforce, his special an-

tagonist in debate among the clergymen of England.

See T. A. Nash, *Life of Lord Westbury* (2 vols., 1888).

WESTBURY, an urban district of Wiltshire, England. Pop. (1921) 3,712. All Saints' church is Norman and later, with a magnificent nave. A chained black-letter copy of Erasmus' "Paraphrase of the New Testament" is preserved in the south chapel. In the suburb of Westbury Leigh is the "Palace Garden," a moated site said to have been a royal residence in Saxon times.

Westbury figures in Domesday as a manor held by the king. The earliest mention of the town as a borough occurs in 1442–1443. The charter of incorporation is lost (tradition says it was burnt), and the town possesses no other charter. The borough returned two members to parliament from 1448. In 1832 the number was reduced to one, and in 1885 the representation was merged in that of the county.

WEST CHESTER, a borough of south-eastern Pennsylvania, U.S.A. Pop. (1920) 11,717 (78% native white and 16% negroes). It is the seat of a State normal school (1871) and several academies of long standing. The Turk's Head inn dates from 1762. On the outskirts of the town are a number of fine estates, where thorough-bred horses and cattle are raised. West Chester was settled in 1713, succeeded Chester as the county seat about 1784, and was incorporated as a town in 1788, as a borough in 1799. The Battle of Brandywine (Sept. 11, 1777) was fought 7 m. to the south, and on Sept. 20 Gen. Wayne, with a small force, was surprised and routed by the British at Paoli, 8 m. N.E.

WESTCOTT, BROOKE FOSS (1825–1901), English divine and bishop of Durham, was born on Jan. 12, 1825, near Birmingham. His father, Frederick Brooke Westcott, was a botanist of some distinction. Westcott was educated at King Edward VI. school, Birmingham, and at Trinity College, Cambridge. He took his degree in January 1848, obtaining double-first honours. In mathematics he was twenty-fourth wrangler, Isaac Todhunter being senior. In classics he was senior, being bracketed with C. B. Scott, afterwards headmaster of Westminster. Westcott then remained for four years in residence at Trinity. In 1849 he obtained his fellowship, and took holy orders. Among his pupils at Cambridge were his school friends J. B. Lightfoot, E. W. Benson and F. J. A. Hort (*qq.v.*). He devoted much attention to philosophical, patristic and historical studies, but it soon became evident that he would throw his strength into New Testament work.

In 1852 he became an assistant master at Harrow, where he taught for nearly twenty years under C. J. Vaughan and Montagu Butler. The writings which he produced at this period created a new epoch in the history of modern English theological scholarship. These are *History of the New Testament Canon* (1855), which, frequently revised and expanded, became the standard English work upon the subject; *Characteristics of the Gospel Miracles* (1859); *Introduction to the Study of the Gospels* (1860), expanded from his Norrisian essay; *The Bible in the* Church (1864); *The Gospel of the Resurrection* (1866); and a *History of the English Bible* (1869).

In 1868 Westcott was appointed examining chaplain by Bishop Connor Magee (of Peterborough); and in the following year he accepted a canonry at Peterborough, which necessitated his leaving Harrow. But the regius professorship of divinity at Cambridge fell vacant, and Westcott was elected to the chair on Nov. 1, 1870. This was the turning-point of his life. He now occupied a great position for which he was supremely fitted, and at a juncture in the reform of university studies when a theologian of liberal views, but universally respected for his massive learning and his devout and single-minded character, would enjoy a unique opportunity for usefulness. Supported by his friends Lightfoot and Hort, he threw himself into the new work with extraordinary energy. His *Commentaries* on St. John's Gospel (1881), on the Epistle to the Hebrews (1889) and the Epistles of St. John (1883) resulted from his public lectures. One of his most valuable works, *The Gospel of Life* (1892), a study of Christian doctrine, incorporated the materials upon which he was engaged in a series of more private and esoteric lectures delivered on week-day evenings. Between the years 1870 and 1881 Westcott was also continually engaged in work for the revision of the New Testament, and, simultaneously, in the preparation of a new text in conjunction with Hort. In the year 1881 there appeared the famous Westcott and Hort text of the New Testament, the outcome of nearly thirty years of incessant labour. The reforms in the regulations for degrees in divinity, the formation and first revision of the new theological tripos, the inauguration of the Cambridge mission to Delhi, the institution of the Church Society (for the discussion of theological and ecclesiastical questions by the younger men), the meetings for the divinity faculty, the organization of the new Divinity School and Library and, later, the institution of the Cambridge Clergy Training School, were all, in a very real degree, the result of Westcott's energy and influence as regius professor. To this list should also be added the Oxford and Cambridge preliminary examination for candidates for holy orders.

In 1883 Westcott was elected to a professorial fellowship at King's. Shortly afterwards he was appointed by the crown to a canonry at Westminster, and became examining chaplain to Archbishop Benson. He held his canonry at Westminster in conjunction with the regius professorship. The strain was heavy but preaching at the Abbey gave him a welcome opportunity of dealing with social questions. His sermons were generally portions of a series; and to this period belong the volumes *Christus Consummator* (1886) and *Social Aspects of Christianity* (1887).

In March 1890 he succeeded his friend Lightfoot as bishop of Durham. The new bishop surprised the general public, which had supposed him to be a recluse and a mystic, by the practical interest he took in the mining population of Durham and in the great shipping and artisan industries of Sunderland and Gateshead. In 1892 he procured a peaceful solution to a long and bitter coal strike. He was a staunch supporter of the co-operative movement. He was practically the founder of the Christian Social Union, and an ardent supporter of foreign missions. His last book, *Lessons from Work* (1901), was dedicated to the memory of his wife, who died in that year. He preached a farewell sermon to the miners in Durham cathedral at their annual festival on July 20, and died on July 27.

The following is a bibliography of Westcott's more important writings, giving the date of the first editions:—*Elements of the Gospel Harmony* (1851); *History of the Canon of First Four Centuries* (1853); *Characteristics of Gospel Miracles* (1859); *Introduction to the Study of the Gospels* (1860); *The Bible in the Church* (1864); *The Gospel of the Resurrection* (1866); *Christian Life Manifold and One* (1869); *Some Points in the Religious Life of the Universities* (1873); *Paragraph Psalter for the Use of Choirs* (1879); *Commentary on the Gospel of St. John* (1881); *Commentary on the Epistles of St. John* (1883); *Revelation of the Risen Lord* (1882); *Revelation of the Father* (1884); *Some Thoughts from the Ordinal* (1884); *Christus Consummator* (1886); *Social Aspects of Christianity* (1887); *The Victory of the Cross: Sermons in Holy Week* (1888); *Commentary on the Epistle to the Hebrews* (1889); *From Strength to Strength* (1890); *Gospel of Life* (1892); *The Incarnation and Common Life* (1893); *Some Lessons of the Revised Version of the New Testament* (1897); *Christian Aspects of Life* (1897); *Lessons from Work* (1901).

See the *Life* by his son B. F. Westcott (1903), and also that by J. Clayton (1906).

WESTERLY, a town of Rhode Island, U.S.A., separated from Connecticut by the Pawcatuck river. Pop. (1920) 9,952 (26% foreign-born white); 1928 local estimate 15,000. It embraces the villages of Westerly and Bradford, and Watch Hill, a seaside resort with a summer population of 5,000. Westerly was settled in 1661 and the town was organized in 1669.

WESTERMANN, FRANÇOIS JOSEPH (d. 1794), French general, was born at Molsheim in Alsace. He accompanied Dumouriez on his campaigns and was arrested as an accomplice in his negotiations with the Austrians. He succeeded in proving his innocence, and was sent with the rank of general of brigade into La Vendée, where he distinguished himself by his extraordinary courage. He was then summoned to Paris, where, proscribed with the Dantonists, he was executed on April 5, 1794.

See P. Holl, *Nos généreux alsaciens . . . Westermann* (Strasbourg, 1900).

WESTERMARCK, EDWARD ALEXANDER, (1862–), Finnish anthropologist, was born at Helsingfors on Nov. 20, 1862. He was educated at a lyceum in his native town, and at the University of Finland where he later became professor of

moral philosophy. In 1890 he went to England, and in 1907 was appointed professor of sociology at the University of London. He made a special study of primitive marriage and ethical origins, and published *The Origin of Human Marriage* (1889); *The History of Human Marriage* (1889, 5th ed. rewritten in 3 vol. 1921); *The Origin and Development of the Moral Ideas* (1906); *Marriage Ceremonies in Morocco*, 2 vol. (1914).

WESTERN ASIATIC ARCHITECTURE from Egypt to Archaic Greece. Racially, as well as geographically, the whole Mesopotamian region is one. The Chaldaeans of the earlier settlements—a mixture of Sumerian and Semitic elements—the Babylonians and the Assyrians, all had the same broad characteristics in their architecture as in their beliefs. The vast plain, watered by the Euphrates and Tigris, was liable to flooding. Hence, the terraced platform was an indispensable preparation for all Mesopotamian building. The ziggurat, or terraced pyramid, was its principal feature but would have been impossible, by itself, without a base on which to stand. Herein lies the great contrast between the architecture of Babylonia and Assyria and that of the dry, firm sand of Egypt.

Chaldaea.—Under this head may be included the architecture of the lower Mesopotamian region from the earliest times till the effective rise of Assyria, *c.* 1275 B.C. The principal factors are (1) the early Sumerian centres of Ur, Erech, Larsa and Lagash, dating from *c.* 3500 B.C. or earlier, to *c.* 2200 B.C.; (2) the overlapping power of Akkad which became the dominating power *c.* 2700–2600 B.C. under Sargon I. and Naram Sin; and (3) the rise of Babylon, *c.* 2200 B.C., culminating in the reign of the great lawgiver, Hammurabi. Each important Chaldaean settlement was primarily the home of the reigning god and of the local ruler as his priest. Ur was devoted to the cult of the moon-god, Nannar, and of his wife, Nin-Gal. The ziggurat—200 ft. by 150 ft. and still 70 ft. high—is a solid mass of brick in high stages and built with bitumen instead of mortar, standing on a brick-paved terrace having a clear front space 300 ft. long and 174 ft. wide. It is the work of Ur Engur, 3rd dynasty king of Ur (*c.* 2300 B.C.) and of his son, Dungi. There is no doubt that the final or temple stage was finished with great richness. At Abu Shahrein there were evidences that the topmost chamber was lined with a mosaic of agate, alabaster, marble and gold, fixed with gold-headed copper nails. This technique has been borne out by recent finds at Ur (*q.v.*).

The retaining walls of the terrace at Ur are massively constructed of sun-dried brick with sloped faces having a series of shallow buttresses. Burnt clay cones are built in at intervals and the circular inscribed ends of these show on the face. On the terrace were cultural buildings and the houses of the god and his wife. Remarkable results have been disclosed by recent excavation. The earliest tomb structures, far below terrace level, go back to *c.* 3500 B.C. and show astonishing facility in the construction of barrel vaults and semi-domes of crude brick. Bricks, both crude (or sun-dried) and burnt, were the great building material of Mesopotamia, a natural result of the rich stiff clay which was the subsoil everywhere. "The walls, constructed and repaired with bricks stamped with names of lords of the locality, contain in themselves alone an almost complete history" (Maspero). Plaster was the usual finish on this brickwork. An important decorative work is the "stela" (inscribed tablet or pillar) of Ur Engur, 15 ft. high and 5 ft. wide, with carvings in panels of unequal heights—arranged horizontally—and an inscription (*cf.*, the later Assyrian stela of Shalmaneser II. in the British Museum). At Tell-el-Obeid, near Ur, was a temple of *c.* 3500 B.C. "At the door stood statues of lions made of copper and on each side of the door were columns encrusted with mosaic in mother-of-pearl and red and black stones" (Woolley, *Times* report, 1925). There is a Greek perfection in the green stone door socket at Ur, "shaped as a serpent with a hollow in the top of its head, wherein the pivot of the door hinge turned" (*ibid.*).

At Lagash (Tello) there is a palace platform 174 ft. by 69 ft., rising 40 ft. above the plain. It belongs to the time of Gudea, *c.* 2600 B.C. There is a distinct arrangement in the setting-out of the buildings and the treatment of portions of the external wall is characteristic—deep rectangular grooves arranged vertically at regular intervals, or rows of semicircular projecting pilasters, like "gigantic organ pipes." At Erech (Warka) the treatment is rendered more decorative by diaper, chevron and spiral patterns, coloured, which are formed of terra-cotta cones sunk deep into solid plaster. Tello is justly celebrated for the quality of its sculpture (now in the Louvre) in excessively hard stone, which is comparable with the early dynastic work of Egypt.

Assyria.—The plan of an Assyrian palace can be seen in Sargon's great centre at Khorsabad, on the east bank of the Tigris. The whole palace area is some 7¾ ac., of which about ¾ rd. is given over to the palace, the remainder being platform area containing the ziggurat and other ritual buildings; but the palace was placed on the centre of the river front of a square enclosure containing the town, occupying, roughly, a square mile and surrounded by a fortified wall strengthened with towers at intervals. The courtyard system is at once evident in the palace and there is more symmetry (or at least deliberate grandiose arrangement) than is apparent at first sight. It is also impossible to judge of the effect of such a work as this from a plan only and without taking into account the accessories of Assyrian architecture—the coloured tile decorations, the gigantic human-headed bulls or lions of the entries and, above all, the magnificent reliefs which are so evident from the show cases of the British Museum. For precision and delicacy of treatment, fine sense of design and mastery in the rendering of animal form, these reliefs can compare with the architectonic sculpture of any age. The entire absence of the column in all Mesopotamian buildings is noticeable.

Babylon.—The latest rebuilding of Babylon by Nebuchadrezzar II. in 604 B.C., after the destruction of Nineveh by the Medes, Babylonians and Scythians, exhibits one of the greatest building achievements that has ever been attempted. It was to some extent a continuation of earlier work by the later Assyrian kings and Nabopolassar, father of Nebuchadrezzar. The palace (or rather palaces) proper, as at Khorsabad, can only be considered as incidents in an immense area which lay on the east bank of the Euphrates for the most part, but also crossed it. The outer wall on the east side consists of two thicknesses of brickwork, respectively 23 ft. and 25½ ft., with an intervening space of 40 ft. This was filled in and a roadway 86 ft. wide constructed on the top. The labour involved recalls the building of the pyramids of Egypt. Various coloured stones were used as paving slabs.

The decorations of the palace were in the prevailing Babylonian style of coloured and glazed tiles—lions, bulls, dragons, flower forms and formal patterns, executed with extraordinary *verve* and richness of colour. Inscriptions record that "the chamber of Marduk, lord of the gods" was "furnished with shining gold" and that eight bronze serpents at the doorways were covered with silver. The Ishtar gate is in a remarkable state of preservation and gives a clear indication of the character of the chains of towers that encircled the palace. The building activities of Nebuchadrezzar were continued by his successor Nabonidus, who became a restorer of sacred sites in Chaldaea. He effected a great levelling up and rebuilding scheme at Ur.

The greatest ziggurat of Mesopotamia—the Birs Nimrûd—11 m. S. of Babylon, was completely restored by Nebuchadrezzar. It was the more usual type which had its origin in early Chaldaea. Its irregular form facilitated ascending stepways between the stages. The whole intention was radically different from the tomb idea of the Egyptian step pyramid (*see* EGYPTIAN ARCHITECTURE). The Mesopotamian ziggurat was a "mountain" built in solid stages having a shrine for the divinity at its summit.

Saturated with the idea of man's conflict with invisible powers, the art expression of Mesopotamia is remote from the humanistic thought of Greece and the modern world. Nevertheless, it contained some forms of great importance in the history of architectural development. (1) The fortified walls with their square towers, especially at gateways, entered into the mediaeval use of Europe; (2) the round pilaster strips of external walls reappear in the Sassanid palaces of the 3rd and 4th centuries A.D., as well as in the Romanesque churches of Italy; (3) lions or other carved pedestals as bases for columns also reappear in Italian

Romanesque work; (4) the bronze bands of the gates of Shalmaneser II. (860 B.C.—now in the British Museum) were so perfect that a very complete restoration of the gates is possible and they remain one of the finest examples extant of metal-craft on such a large scale before mediaeval times; (5) the magnificent output of glazed tile relief which, originating in Babylonia, was characteristic of Assyrian and Neo-Babylonian work, was translated into new forms by later Persian artists and became the greatest contribution of the Middle East to architectural decoration; (6) lastly and most important of all there is the first use of the arch, vault and semi-dome—with all that is meant by that—anticipating the construction of Rome, not a few centuries but some 3,000 years later.

Persia.—The Neo-Babylonian empire was founded in an insecure age and perished, with all its splendour, in 538 B.C., only 66 years after the final collapse of Assyria. The real masters of western Asia during this period were the Medes in the first instance, followed by the Persians, to whom they were allied but by whom they were subsequently conquered (550 B.C.). The Medes overran Asia Minor and subdued the great Ionian State of Lydia—an important event, as it brought western Asia into direct contact with Greek culture. The 6th century temple of Artemis at Ephesus was built by Croesus, king of Lydia; and Cyaxares, the Mede, may have seen this as well as the temple of Sardis, the capital. There are comparatively few architectural remains from this warlike period and from the succeeding one of Cyrus, the great Persian, conqueror of Media and Babylonia. The most important is the "tomb of Cyrus" at Passargadae—a very interesting stone-built monument recalling the tombs of Lycia and certainly foreign to its district; though it has been suggested that it may be a Persian adaptation of the stepped towers of Mesopotamia. Cambyses, son of Cyrus, effected the complete conquest of Egypt, and his successor Darius (521 B.C.) consolidated the empire and founded Persepolis. Xerxes, following him, continued building at Persepolis, invaded Greece and after a ten years' conflict was finally routed at Plataea (479 B.C.).

We note the geographical position of Media and Persia on the Iranian plateau, at a high elevation above and to the east of the Tigris valley. Stone of superb quality was abundant in this region and may partly account for the entirely new plan principle that is discovered in Persian architecture. The Persian palaces at Persepolis and Susa were built on raised platforms enclosed by terrace walls and approached by step-ways, recalling in this way those of Mesopotamia; but the structures above were columnar halls, like those of Egypt. The largest of these—the hall of the 100 columns at Persepolis—is 225 ft. square, though its columns were only 37 ft. high as against 67 ft. in the smaller hall of Xerxes on the same site. In many respects also the details were partly Egyptian and partly Greek. The gateways of the hall of Xerxes have the colossal winged genii associated with Assyrian palaces and the staircase leading to the terrace has wild-beast reliefs on its balustrade (though these are not purely Mesopotamian in feeling), but the cornices over the doors are Egyptian in form and the side posts of the doors in the hall of 100 columns have a surface decoration in low-relief set in panels, the idea of which is strongly reminiscent of Egypt.

The much discussed columns of the hall of Xerxes are frankly bizarre. They had no permanent influence on future work. But the halls of the Persians were probably the finest that have ever been built and their decorative craft work of the early 5th century B.C. was equal to any Greek work of similar technique.

The Hittites.—Hittite architecture must be considered an anti-climax after the developments previously described, but it constituted an element of stability influencing the whole of the east Mediterranean region at a most important period, from *c.* 1500–1000 B.C., a period in which Mesopotamia was comparatively quiescent and which survived the zenith and decline of Aegean art. The earlier Hittite palace of importance was at Boghaz-Keui in north Anatolia; the later was at Carchemish, on the Upper Euphrates, and on the same latitude as the Assyrian sites but some 300 miles to the west. The architectural evidences were of a rude and primitive kind and the sculpture similarly so; but there are abundant examples of the latter in vigorous reliefs. At Carchemish, also, there were some carved lions of a rather fine though archaic type, which appear to have carried columns, though this is not certain; but of their decorative function as guardians of an entrance there can be no doubt.

Crete.—Not even the discoveries of 1925 to 1928 in southern Babylonia have been so arresting as the disclosure of the civilization in Minoan Crete which forms the connecting link between Egypt (*see* EGYPTIAN ARCHITECTURE) and Greece (*see* GREEK ARCHITECTURE). The island formation of Crete was favourable to settled development, as the sea formed an insuperable obstacle to nomadic tendencies. This may of itself have accounted for the steady progression of Crete in systems of rectangular construction, which rapidly absorbed all circular or oval constructions (except for certain tomb structures) and culminated in palaces of great size. The immensely important site of Knossos—situated some four miles inland from Candia, the mediaeval capital of Crete—contains on its palace site the clearest evidence of unbroken continuity in development from early Neolithic times till about 1400 B.C. We have here therefore a Mediterranean tradition which, though it had contacts with Egypt and Mesopotamia, is neither African nor Asiatic and which became one of the life-giving sources of all later European art.

The vital force of Minoan building development lies in its amazing output of palace construction which reached its culminating point during the third Middle Minoan period (*c.* 1700–1580 B.C.). Many centuries before history and in a remote island of the Mediterranean there were building developments which were not matched in a domestic sense till the era of the greatest palaces of the Renaissance. There was a certain amount of faced masonry but a thorough system of wooden construction prevailed as a framework to a general infilling of—for the most part—such very rough rubble that it survives practically as mere earth. The inner walls, where not faced with large, thin gypsum slabs, were covered with lime plaster of superb quality, varying in thickness from 2 or more in. to the thinnest possible coating of stucco. The ultimate finish was colour, on a slip of the finest stucco, forming a true fresco. It is remarkable that so much of this apparently flimsy construction and finish should have survived for more than 2,500 years in a semi-northern climate by no means altogether dry.

Knossos.—The frescoes at Knossos enable us to re-construct the entire life of the period. The variety and scale of the subjects represented were extraordinary—life-size figure processions and bull-grappling scenes; landscapes with figures, animals, birds and marine creatures, set as definite picture-subjects within borders; ceremonial scenes, often with crowds of figures and architectural backgrounds—the last mentioned extremely valuable in their structural suggestion and in their proof that the buildings of the palace were themselves coloured. The floors of the principal rooms were paved with gypsum slabs covered with thin hard coloured stucco. Some of the ceilings must also have been of coloured plaster, in semi-geometrical or running patterns. The principle of coloured decoration was carried through the whole of the palace: even the storage rooms of the basement were finished with deep-red plaster, having skirtings and dado lines in grey and white. The fresco finds show that the elaborately dressed Minoan ladies were able to watch spectacular displays from windows with great facility; also that windows were large and had "mullions."

Columns must have been of wood and have formed part of the colour scheme. Column bases of circular or oval form projected slightly above the floor and were of gypsum or limestone. A few were of coloured marble or beautifully variegated stone, indicating a technique of which no further details are available. Of architectural details and accessories the most important are some wonderfully carved stone bands with rosettes and other patterns; the gypsum benches that lined the walls of some of the rooms (those in the "Throne Room," dating from the last phase of the late Minoan period, being associated with a gypsum throne of unique character, showing clear indications of a wooden origin); the stepped balustrades of the staircases and of the low-level tanks that were probably associated with religious rites;

and, even more important, the niched seat or throne raised three steps as a centrepiece behind a low parapet at one end of the principal suite of apartments in the "Royal Villa," with its strong suggestion of the raised altar and apse of later Christian usage.

The layout and economy of the great centre which contained these features has been preserved almost entire in its ground plan. Broadly, it is a square of about 400 ft. with a central open court 175 ft. long and nearly 100 ft. wide. At the northern end of this, towards the sea, is the main entrance passageway, but this entrance was masked and probably strongly guarded. The main State entrance was on the west side, an indirect entry looking on to a great paved court and leading to the south terrace. Here the king may have "sat in the gate." The impressive size of the entry—which has a large central column dividing a total span of 37 ft.—and the frescoed richness of the processional way leading from it, formed a fitting approach by a double turn to a great suite of State apartments going northwards and raised some 8 ft. above the central court. The greater part of this western area was carried on the massive basement walls which are now existing, the floor being below the level of the central court. The outstanding feature of this basement is its great series of storage magazines, over 200 ft. in length.

On the east side of the central court the ground descended smartly to a pleasant river valley. A deep cut in this slope held the most perfectly preserved portion of the palace—the domestic quarter—accessible from the central court by a fine staircase in tiers of two flights round a newel wall. This staircase affords conclusive evidence of three storeys; in all probability there was a fourth storey. The domestic quarter at Knossos is the most complete epitome of Minoan planning on a grand scale that exists. The open balustraded area on the farther (east) side of the grand staircase was one of a system of five internal areas which gave light and air to the whole group of apartments. These areas were faced with limestone and paved with pebble cement, in contrast to the gypsum finish of covered quarters. Descending shafts and a perfect system of underground drains, all stone-built, carried away the roof water and other drainage. Two smaller staircase systems served the treasury and the queen's apartments respectively. On the upper floors must have been bedrooms and nurseries and other rooms for general use. The whole system ends gracefully on a columned piazza with a spacious verandah above, overlooking the river.

Phaestos, Hagia Triadha, Gournia, etc.—The palace of Phaestos, near the south coast of the island, is distinctly inferior to Knossos in size and importance, but it was probably the seat of a king, though perhaps a tributary one. It supplements in an admirable way many things that Knossos has lost, owing to the fortunate fact that the great stepway leading to its State apartments still exists complete and is here a truly monumental feature, about 42 ft. across. The peristyle character of at least a considerable part of the central court at Phaestos is clearly evident and also the existence of smaller courts of peristyle type. The little summer palace of Hagia Triadha, near Phaestos, is more complete in a domestic sense. Its fragment of "cat and bird" fresco is one of the greatest treasures of Minoan art. There were other centres in the eastern part of Crete, of which Gournia, close to the north coast, is the most perfect Minoan town that has so far been discovered. Its whole extent is less than that of the palace at Knossos, but it contains streets, houses and a tiny palace. It also illustrates, equally with Knossos and Phaestos, the skilful choice of a Minoan site.

The last two centuries of the late Minoan period were a time of decadence and re-occupation, following conquest (*c.* 1400 B.C.) by some outside power, probably Mycenae on the mainland of Greece. Architectural remains which are pre-Greek and yet subsequent to 1000 B.C. are practically non-existent. The most important is a unique temple building, of which considerable fragments were found, at Prinias in Crete (*c.* 700 B.C.). The doorway of this—cut out of soft stone and now in the Candia museum—is strongly reminiscent of Egypt. There is the same tendency to put shallow relief sculpture on architectural members. The horse appears for the first time in these reliefs. The lintel has an opening above it, flanked by seated figures of semi-Egyptian character, while the lintel itself has a full-length female figure carved on its underside, probably the mother-goddess of the earlier age.

Mycenae and Tiryns.—Mycenae is the outstanding example of a mainland architectural development intimately associated with the zenith and decline of Crete. There are the same motives in palace planning, and the same decorative outlook; but Mycenae —and even more pronouncedly the neighbouring fortress of Tiryns —show a cyclopean method of construction hardly found in Crete. The most impressive single feature is the Lion gate of the citadel of Mycenae; the greatest structural works are the "beehive" tombs of the same centre, particularly the largest and best preserved—the so-called "Treasury of Atreus," which was undoubtedly a tomb. The galleries (or side entrance passages) of Tiryns can justly be placed beside them. We see quite clearly that this massive building development in stone reflects an age of insecurity, when powerful kings built fastnesses which were key positions, in periods succeeding one another approximately from 1500 to 1200 B.C. The Lion gate is an appropriate incident in such a fastness. Its rude but semi-scientific cyclopean construction absorbs a feature which has made it famous—the great slab above the lintel, carved with two majestic maneless lions fronting a central pillar. The beasts' heads are gone and may have faced the spectator, but whether in alabaster or bronze we do not know. The existing remains are in a very hard breccia stone.

The beehive tomb shows by contrast, a fine method of construction. The doorway to this tomb, even in its nearly stripped condition, is the most important purely architectural work of prehistoric times in Europe. Its scale is impressive; the inner lintel is 29½ ft. long, 16½ ft. deep, 3 ft. high and 120 tons in weight. The finish was given by attached half columns, applied rosettes and bands of various forms, all richly carved in grey-green and purple porphyry-like stones. Some considerable fragments of these are in the British Museum. The tomb itself—which is nearly 50 ft. wide—is a pointed dome, but (as in more ruined Cretan examples) is built with overhanging stones laid flat. There is no sign of a true radiating arch or vault anywhere, the keystones of the vaulted galleries at Tiryns being the nearest approach to such construction.

Troy.—The city of Hissarlik, or Troy, on the eastern shore of the Dardanelles, is the remaining work of Mycenaean times on the mainland which need be noticed. It can show nothing of positive architectural value which cannot be seen at Tiryns or Mycenae. The great value of Troy is its burg or fortified site showing successive strata dating from *c.* 3000 to 1000 B.C. As at Mycenae and Tiryns, the central round hearth is found, which was practically unknown in Crete. That this was a northern feature is certain. Another fact of interest is the use of crude brick for walling—an important link with Mesopotamia.

So far as we are aware, there was no continuity of tradition between the architectural forms of the Aegean civilization and those of historic Greece (*see* GREEK ARCHITECTURE), but there were several root forms, particularly in the plans of buildings which are common to both and bring Greek structures much nearer to Aegean ones than to any others. (1) The idea of the Greek temple plan can be seen clearly in the *megaron* (hall) with its extended side walls at Mycenae and the contemporary Troy; (2) the plan of the Athenian propylaea or great entrance gateway to the Acropolis is based directly on forms in Crete and on the mainland; (3) the high course of upright marble slabs at the base of the cella wall in the typical Greek temple of the 5th century B.C. can be seen in the west wall of the palace of Knossos and other Minoan sites; (4) the use of the column for various purposes is very much the same in both epochs. The decorative use of fresco in Cretan houses and palaces deserves special mention, as its influence on Greek and subsequent painted decoration may have been profound, but only the threshold of this enquiry has, so far, been reached. The sense of decorative values and the acute observation of natural forms conventionally rendered, all produced in pure colour, bring the best Cretan fresco into line with Chinese and Japanese painting; and the oriental touch is surer than in the somewhat parallel art of Tel-el-Amarna (*see*

EGYPTIAN ARCHITECTURE; ARCHITECTURE; PERIODS OF ART).

BIBLIOGRAPHY.—For Chaldaea, much information is contained in *Times* reports of excavations at Ur (Jan. 1925 to March 1928) pending publication in more permanent form. *See* also J. E. Taylor in *Journ. of R. Asiatic Socy.* xv. (1855); W. K. Loftus, *Travels and Researches in Chaldaea and Susiana* (1857); E. de Sarzec, *Découvertes en Chaldée* (1884–1912, for Tello); G. Perrot and C. Chipiez, *Histoire de l'Art dans l'Antiquité*, vol. ii. (1884). All these are admirably summarized in G. Maspero, *Dawn of Civilization* (trans. M. L. McLure, 1914).

For Assyria, Sir H. Layard, *Nineveh and Babylon* (1853); G. Perrot and C. Chipiez, *op. cit.* and *Hist. of Art in Chaldaea and Assyria* (trans. W. Armstrong, 1883).

For Persia, M. Dieulafoy, *L'Art antique de la Perse* (1885) and *L'Aeropole de Suse* (1890); G. N. Curzon, *Persia and the Persian Question* (1892); G. Perrot and C. Chipiez, *Hist. of Art in Persia* (Eng. trans. 1892).

For the Hittites, O. Puchstein, *Bogaskoi, die Bauwerke* (1912); J. Garstang, *The Land of the Hittites* (1910); D. G. Hogarth and L. C. Woolley, *Carchemish* (1914 and 1921). A good general account covering the whole field is E. Bell, *Early Architecture in Western Asia* (1924).

For the Aegean area (Crete), refer also to periodicals. For structural aspects, D. Mackenzie, *Cretan Palaces and the Aegean Civilization*, Annual of the British School at Athens, XI., XII., XIII. and XIV. For fresco, D. T. Fyfe, "Painted Plaster Decoration at Knossos," *Journ. of R. Inst. of Brit. Architects*, X. 4 (1902); N. Heaton, "Mural Paintings of Knossos," *Journ. R. Soc. of Arts* (1910); "Minoan Lime Plaster and Fresco Painting," *R.I.B.A. Journ.*, XVIII. (1911); and in *Tiryns* (*see* below). *See* also article on AEGEAN CIVILIZATION.

For Aegean area (mainland) refer to article on AEGEAN CIVILIZATION; particularly (for fresco) G. Rodenwaldt and others, *Tiryns* (1912 *et seq.*). (D. T. F.)

A general account covering the whole field (not quite up to date on Crete) is E. Bell, *Prehellenic Architecture in the Aegean* (1926).

WESTERN AUSTRALIA, the largest of the States, occupying 975,920 sq.m. The length is about 1,480 m. and the breadth about 1,000 m. while over one-third of the total area (37·3% = 364,000 sq.m.) lies north of the tropic of Capricorn. Its distance from the populous eastern parts of the continent is offset by its position with regard to the ocean routes leading to the homeland, to which it is the nearest, and from which it is,—in spite of the Panama Canal—the first Australian land of call.

Physiography.—The broken coast-line of the north-west, formed by the marginal submergence of a deeply dissected plateau, contains several fine areas of enclosed waters which flank a main gateway between the Pacific and Indian oceans. Large tidal ranges—up to 38ft. in Hanover bay—and in some cases tidal currents (*e.g.*, King Sound) are a disadvantage.

Moreover, southward from this the sandy Ninety Mile Beach, and further on, the low, straggling, and often shallow inlets, promontories and islands, fringed in places by coral reefs, form part of a relatively undistinguished and inhospitable coast where exposure and silting (due partly to recent coastal elevations) present difficulties to harbour construction. The estuary of the Swan River forms a notable exception, Fremantle being one of the best and most commodious of natural harbours, while Geographe Bay is also relatively protected. From Cape Naturaliste onwards much of the south and south-west is flanked by high, rocky and exposed coasts in which such inlets as King George Sound form excellent harbours (Albany), while further east this passes over into the unbroken cliffs of the Nullarbor Plain area (*q.v.*). As a whole Western Australia is a closed land-mass and has no relatively large maritime indentations.

To water-supply, owing to the climate, peculiar importance attaches. Four main, besides parts of smaller, artesian basins lie wholly or in part within the State; the Eucla or South-eastern (*i.e.*, approximately the Western Australian portion of the Nullarbor Plain); the Coastal Plains basin in the south-west (Cape Lecuwin—Dongarra); the North-western or Carnarvon basin (Gantheaume bay—Onslow); and the Desert or Broome basin. The extent and capacity of the Eucla and Broome basins has not yet been fully tested though they are both, and particularly the latter, large, and, in general, apart from the Coastal Plains basin, the resources have as yet not been fully exploited (1926: 230 bores, yielding 66,760,000 gal.; depths from 3,325-39 feet).

In the Perth area some 50 bores supply water to the city, Fremantle and adjoining districts while the northern basins largely underlie coastal lowlands and enhance their natural pastoral value. The wells in the Perth area are notably fresh, but around Eucla and some in other parts they are saline. Fresh discoveries of artesian or sub-artesian supplies are from time to time reported *e.g.*, in the Northern Goldfields pastoral area, and there are, in addition, considerable reserves of shallow-seated sub-surface waters (*e.g.*, in the Perth and other coastal lowlands). In the interior large areas can be made available for the carrying and movement of stock (*e.g.*, Murchison area and *cf.* the Wiluna-Hall's Creek route) by means of wells many of which are natural—solution pits in limestones, "native wells," "gnamma holes," etc. Unfortunately these shallow supplies are saline over considerable tracts (*e.g.*, in the Wheat Belt and Kalgoorlie areas), while the vast number of "lakes" in the interior are little more than saline flats akin to the widespread clay-pans. The lack of adequate fresh water in the interior south-west has been met by a vigorous policy of surface (rainfall) storage and reticulation. Chief amongst such schemes is the Gold-Fields Water-supply Scheme by which water derived from a catchment in the Darling ranges behind Perth is stored in the Mundaring reservoir (760 ac.; 4,650 million gal.) and conducted thence by means of a pipe-line with 8 pumping stations to a service reservoir (12,000,000 gal.) at Bullabulling 307 miles distant. Thence the water is reticulated by gravity to Kalgoorlie (44 m.); it is also supplied to 30 towns "en route," to mines, and to agricultural areas (500 extensions). (Total area covered: 16,000 sq.m.; total length of mains [1926]: 1,454 miles; total consumption: 1,161,000,000 gal. per ann.—railways, *c.* 8%; mines, 22%; "other," 70%. Capital cost, £3,642,000; revenue, £179,400; expenditure, £218,950.) There is an extensive system of water-supply to towns (1926: 23 towns, pop. *c.* 14,000; 108,000,000 gal., including railways) and to agricultural areas.

Climate.—Western Australia covers such a wide area that several distinct climatic regions are included in it, though observations for considerable areas are scanty or lacking. (*a*) The north has a "monsoon" climate, with prevailing high temps. (85°–70°), a markedly summer rainfall (November–April with max. December, January, February) brought by depressions ("lows") from the tropical seas to the north-west. The rains are heavier in the north and tail off southwards and they are irregular and often torrential, causing severe floods in the valleys; (*b*) the north-west, lying south-west from the above, is characterized by its high summer temps.—there is a large area with averages over 90°; by its long and severe heat spells—at Marble Bar temps. over 100° have been recorded on 103 consecutive days—and by an extremely erratic rainfall (10–20 in.). Thus in the north rain falls mainly Jan.–March but further south winter rains predominate and these reach occasionally as far north as Broome. This region is visited in summer, but at irregular intervals (45 during 50 years) by intensely developed cyclonic depressions coming from the north-west ("Willy-Willies"). The Cossack and Onslow areas in particular suffer from their destructive violence. (*c*) the South-western "winter-rain" region comprises most of the south-west of the State. Temperatures here range from 50°–80° with occasional short heat-spells, though conditions are progressively less equable towards the interior. The weather is dominated by the passage (west–east) of large anti-cyclonic (high-pressure) and cyclonic (low-pressure) systems which involve variations (chiefly short-period) of temperature, wind-direction, etc. Occasional rains penetrate southwards from the north and fall in summer, but the chief rainfall is brought by the "lows" from the Indian Ocean and this falls in winter (May–Oct.) and is relatively reliable. (*d*) Of the vast interior little definite is known, but of the more settled portions it may be said in general that they partake of the character of the areas described and form inland extensions of them. (*See* KALGOORLIE.) Rainfall, however, decreases to 10 in. or (av. ann.) less and it also becomes less reliable. The range of temperature (ann. and diurnal) becomes greater (up to 30° or more), and in parts the climatic conditions become those of a desert. This

desert approaches the coast in the north-west and runs thence broadening in an east and south-east direction into the winter rainfall area, the rather higher (average) rainfall in the north being counteracted by higher temperatures. Of the Western Australian climate it may be said that, in spite of the heat, dryness, humidity and dust which afflict parts in various degrees and seasons, in general it is not unhealthy.

Vegetation, Timber, etc.—Most of the State is clothed, though unevenly, with vegetation, even arid portions having some scrub, heath, or wiry grasses. In the north (Kimberley Divisions) the coastal lowlands, river valleys and ranges carry in parts patches of forest which may contain some useful timber. But the predominant type is grassland with trees, savanna adapted to the annual dry season. Inland and southwards, as rainfall diminishes, this type degenerates into scrub and passes into the scrub ("desert gums") and spinifex of the sandier interior. Along part of the north-west coast lies a belt of grasslands backed by scrub which affords useful grazing, and mangroves, common farther north, line parts of the coast here also. But farther south the poor country approaches close to the coast (*see* above, Climate), and from hereabouts stretches south-eastwards into the little-known east-central interior the scrub and spinifex type which at best has poor pastoral value. On the southern side of this poor belt in the north-west "shoulder" of the State (Ashburton, etc.), a better type of scrublands begins to appear and south and east from the Gascoyne River (*i.e.*, from the beginning of the regular winter rainfall area) begins the mulga pastoral country possessing also good sub-surface waters. This extends south-eastwards inland to *c.* lat. 29° S. where it passes over into the beginnings of the southern forest country—the Salmon gum open-forest lands of the Kalgoorlie, etc. goldfields. This forest has proved invaluable to the mining industry by supplying mining timber and fuel. In the south-western corner of the continent—*i.e.*, the portion lying south-west of a line running approximately from Sharks bay (*c.* lat. 25° S.) to near Israelite bay (*c.* lat. 33° S.; long. 124° E.)—the belts of vegetation, as indicated above, appear to follow rather closely the belts of (winter) rainfall. Thus the gold-fields forest (Morrell—Salmon gum) passes southwards, in the belt of 10–20 in. av. ann. rainfall, into the mallee, jam and wandoo forests farther south-west, though mallee and saltbush country prevail towards the southern (Bight) coast. The prevailing types are now eucalyptus—the "jam" is an acacia—and the belts referred to (jam, wandoo, York gum, marri or red gum) form a transition zone in which trees of increasingly better growth pass over into the real forest area of the State. This lies S.W. of (approximately) the 15 in. rainfall line and is *c.* 350 miles long and 50–100 m. wide, about ⅛ of the total forested area of the State (i.e., *c.* 20,000,000 out of *c.* 100,000,000 ac.) being contained herein, though probably only some 3,000,000 acres carry merchantable timber. A line drawn from about Gingin to rather east of Albany marks off what is perhaps the most valuable timber area in Australia. Here the distribution of types is markedly dependent upon rainfall and soils. Behind the immediate coastal fringe in the south lie, in the areas of 40–30 in. rainfall, *c.* 250,000 ac. of karri forest composed of handsome giants 200–250 ft. in height yielding tough wood valuable, when "powellised," for constructional purposes, etc. From near Busselton to about Marginiup (N. of Fremantle) the 5 m. wide strip of coastal limestones supports tuart (average height *c.* 150 ft.) growing in more open formation. But the greater part of the area (40–25 in. rainfall) north of the karri forests is occupied mainly by jarrah interspersed with marri (*c.* 8,000,000 ac., of which some 2,750,000 ac. are commercially useful). The jarrah prefers lateritic soils and the trees, which in good areas average 100 ft. in height, yield first-class hardwood resistant to weathering and insects which is in demand for paving-blocks, piers and other out-door constructional purposes. The area "dedicated" to forests has been recently largely extended (1,832,000 ac.) and a total of 3,000,000 ac. is aimed at. Vigorous measures are now being taken to control and regenerate the timber reserves and the planting of pines (soft-woods) on a large scale has been commenced (*e.g.*, Mundaring and South Perth). Saw-millin an important industry. In 1925–26 some 329 million super were cut, much of the product being used locally but consi able quantities are exported abroad largely through Bunl (*q.v.*). Other forest products are sandalwood, a shrub (*c.* 1 high) which grows sporadically upon sandy soils over mucl the south-west interior. It yields a wood especially value China, to which it is exported, and also an essential oil. M bark has valuable tanning properties. Wasteful exploita caused production to decline, but reforestation is now progress. (*See* also AUSTRALIA: *Forestry*, and below. Statis Survey *s.v.* Manufacturing Industries, in which "Wood-work refers largely to saw-milling; also *s.v.* Trade: exports.)

Mining.—This industry has declined greatly in recent y Western Australia (1926) was the second largest produce minerals (after New South Wales) but the value of her output was relatively small (£2,372,000, *cf.* New South W £16,319,000), the number of men employed had fallen to 5, and mineral exports represented only 10·9% of the total v of exports (*cf.* 1903: 84·5%). Gold is the most impor mineral produced (68·25% of the Commonwealth total). M of the well-known fields are still being worked but the C gardie, Mount Margaret and Murchison areas were by far most important (*e.g.*, E. Coolgardie gold-field: 50% of mi and 73% of output, of gold in State). More recently there been indications of a slight revival in Western Australian mi and great prospects undoubtedly lie before the Wiluna gold- (*q.v.*). Coal: The only field being worked (1927) was at C (7 collieries producing 501,000 tons). The coal is consumed wi the State (largely by railways), the coal reserves being a partic boon in view of Western Australia's position and her rela shortness of power resources. Recent borings for oil in the n (Kimberley Division) though inconclusive give some pror (*See* also: AUSTRALIA: *Minerals; Mining and Metallurgy.* KALGOORLIE; and below, Statistical Survey: Production; Mi [giving figures for 1927]; Exports; above, Water-supply.)

Land Settlement, Agriculture, Dairying, etc.—Wes Australia, though founded as a colony as early as 1829, slowly and in 1890 when it became a self-governing State population was only 46,290. The gold-boom of the "nine nearly quadrupled this total (1900: 179,708). Thereafter car lull, followed by a decline owing to the war of 1914–18. present the population is again increasing steadily (1927–28 15,000). These statistics are significant in that they reveal vital factors controlling Western Australian development. 1914 Western Australia had barely begun to emerge from more purely pastoral and mining régime which formed the ea stage in the development of most Australian States. She is fully launched upon a course of intensive land settlem She is attracting men and capital not only from overseas from her Eastern neighbours; the area of occupied land rapidly expanding—during each of the last two years, 192 and 1927–28, some 13 million ac. of new lands were taker (1927–28: conditional purchase and farms: *c.* 418,000 grazing and pastoral leases: 12,823,000 ac.) and the pro continues. The "3,000 farm scheme" now being inaugurate "probably the largest single (land-settlement) scheme which ever been undertaken by a Government in Australia." It at establishing 3,000–3,500 new 1,500 ac. wheat-and-wool f in the block of country (*c.* 12,500 sq.m. or 8,000,000 ac.) w lies southwards from Southern Cross and the main (gold-fi railway line, eastwards of the Esperance–Norseman railway and west of the existing rail-heads in the South-western Divi Some 600 miles of railway line and 6,000 m. of roads, be large water-conservation works, will be required and s £8,000,000 expenditure will be involved of which the Comm wealth and British Governments will supply shares.

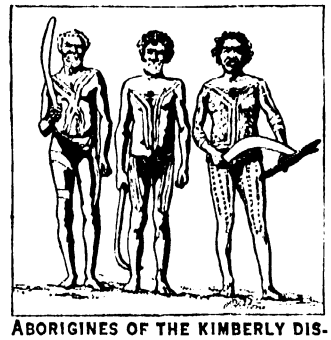
Wheat.—In the first 70 years of her existence Western tralia produced altogether only *c.* 15 million bu. of wh in the year 1927–28 she produced 35,187,195 bushels. Al southern States have increased their wheat areas in recent but Western Australia has probably shown the greatest rel

increase. In 1927–28 422,000 ac. were added and in the period 1920–21 and 1928–29 nearly 2,000,000 ac. (excluding wheat areas cut for hay: 1928–29, 250,000 ac. estimated), an increase of 156% (South Australia, 56%; Victoria, 22% in the same period). Moreover while the yield per ac. is very fair (11–12 bu. per ac.; *cf.* Australian average ten years 1916–26: 12.41 bu.), the seasonal fluctuations have been less marked than in some of the eastern States:

	N.S.W.	Victoria	S. Aust.	W. Aust.	
1926–27 . . .	47·37	46·88	35·56	30·02	mill. bus.
1927–28 . . .	27·01	26·16	24·06	35·18	
Increase (+) or decrease (−) .	−20·36	−20·72	−11·50	+5·16	

Further, Western Australia's exports of wheat have mounted in value from virtually nil to nearly £7,000,000 within the 22 years 1905–06—1927–28. The reasons for this lie to some extent in physical circumstances. Some 93,500 sq.m. of territory in the south-west of the State receive an average rainfall of 10in. or over during the winter growing season (April–Oct. inclusive), and the belt of country climatically suited to wheat-growing is bounded by a line running from the coast north of Geraldton (*c.* lat. 27° 30′ S.) south-eastwards via Southern Cross and Norseman to the sea coast at about Israelite bay (lat. 33° S.; long. 124° E.). On the south-west the limits are partly geological (soils) but mainly set by heavier rainfall, and coincide in the main with the eastern limits of the heavy (jarrah) forest area. Within this 10–20in. rainfall area, though there is much rocky, saline and otherwise unsuitable terrain, the surface is generally flat, often monotonously so. The rainfall, though fluctuating, is relatively reliable, so that a smaller fall is economically as valuable as the heavier but more erratic falls in some of the wheatlands of the Eastern States. Experience, seed-selection, "dry-farming," and an appreciation of the value of light lands and increasing skill in dealing with them, the growing use of artificial manures—almost entirely superphosphates—the extension of mixed wheat-and-sheep farming, and water conservation have all played a part in the expansion referred to, the work of the State agricultural services, the State Agricultural Bank, etc. being also largely responsible. A hot sunny summer for ripening the harvest is shared by the eastern States, as is also the general benefit of an expanding world market, and perhaps the reliable winter rainfall, cheap land, and an enterprising railway-construction and settlement policy are the chief factors in attracting settlers and capital from the eastern States. Clearing is lightest in the eastern (Salmon gum, etc.), heaviest in the western (Wandoo, etc.) part of the wheat-belt, and the agricultural seasons—ploughing, sowing, harvesting, etc.—become progressively later as the wetter south-west and southern coastal areas are approached, where, however, heavier yields are apt to be obtained (*e.g.*, 30–42 bu. in the Gnowangerup district north of the Stirling range). Dependent on wheat-growing is the manufacture of agricultural machinery and the making of superphosphates (*e.g.*, fertilizer factories near Perth and in construction at Geraldton. Output, 1923: 93,000 tons; 1926–27: 187,000 tons. In 1927–28 217,000 tons were carried over the State railways). Western Australian wheat is of good quality. The value of wheat exports in 1927–28 was £6,994,528, Fremantle alone shipping 5,683,000 bags.

The export trade is now being greatly strengthened by the Government policy of (voluntary) inspection and guarantee and it is significant of Western Australia's commercial position that amongst her customers she includes South Africa, India and Egypt. *Oats* are the cereal second in importance to wheat. The yield of grain was (1926–27) nearly three million bu. (12.4 bu. per ac.) and for 1928–29 some 559,000 ac. are sown. The grain is not of such good quality as that which comes from wetter climates (*e.g.*, Tasmania) and a considerable area is cut for hay. *Hay*, as elsewhere in Australia, is an important crop since roots and similar fodders are not so plentiful as in the moister lands of north-west Europe. Wheat, barley and oats all provide hay, the drier lands of the eastern wheat-belt, where the crops will grow but will not seed, being largely used. With the increase in grain production and the growth of more intensive farming (*see* below) the area under hay has significantly declined (1923: 431,600 ac.; 1928: 354,000 ac.). The product is mainly consumed locally. *Dairying, Fruit-growing, etc.:* The belt of coastal country which extends from about Gingin (*c.* 50 m. north of Perth) and runs southwards past Bunbury round to about Albany, and which is served by the South-Western railway and also, farther east, by the Great Southern Railway systems, contains the bulk of the natural dairying, mixed-farming and fruit areas of the State. Its natural condition is largely forest-land (*see* above), with plentiful surface water, mild climate (30–40 in. av. ann. rainfall) and varied but predominantly good soils, being distinguished from the jarrah belt proper which has lateritic soils more suitable to forests. Clearing is difficult and expensive and progress has been slow but there is developing here one of the great dairying districts of Australia. Dairying is only in its infancy in Western Australia but the number of dairy cattle is rapidly increasing (1916: 31,000; 1927: 67,000), scientific methods are becoming general—largely owing to the teaching and example of the State dairy farm at Denmark—and the yield per animal is increasing. In 1927 Western Australia produced: butter, 4½ million lb.; cheese, 164,000 lb.; bacon and hams, *c.* 2,000,000 lb. (*cf.* 1914: 415,000 lb.; 1,675 lb.; 112,400 lb. respectively) and should, at the present rate, soon dispense with the dairy products it has so far imported from the eastern States (see *Statistical Survey: Imports*). The revolution, for such it is, which is taking place, is due partly to the adoption of "subterranean" clover cultivation with superphosphates. Sheep also almost everywhere form a part of the mixed farming régime in the "south-west" and very heavy carcasses and fleeces are grown. *Fruit-growing* is also practised, the forests cleared from the well-drained hill slopes being replaced by orchards. The fruit mainly grown so far is apples, but a beginning has been made of growing oranges and other sub-tropical fruits. Vines are also cultivated, mainly along the inner margins of the coastal belt north and south from Perth (*cf.* the Swan River valley), the grapes, raisins, currants and wine (1926–27: 292,000 gal.; 1927–28, *c.* 350,000 gal.) having found an increasing market. The sandy and swampy coastal margins which are near Perth are also found very suitable for market-gardening and large quantities of vegetables are now being grown, while in addition to the above poultry-farming is also a rising industry.



Pastoral Industries—Various.—As elsewhere in Australia the pastoral industry was a pioneer, though in places it followed upon, and partly subserved, mining (*e.g.*, Goldfields area). Similarly it yields, broadly speaking, to closer settlement as cattle yield, upon lands suitable to both, to the more profitable sheep. Important exceptions, however, are the mixed sheep-and-arable and also the dairy farming systems already noted, where the agricultural and pastoral economy interpenetrate, or rather co-operate, to intensify and stabilize production. Thus the south-west portion of the State contains perhaps 50% of the total sheep population, and a fair amount of stock-fattening (meat) is carried on here also. *Sheep* as an independent product are favoured by the light and relatively dry climate of the south-east, centre and north-west portions of the State; in the north, with its heavier (summer) rainfall and rank-growing grasses, they yield in importance to cattle. The Western Australian Nullarbor Plains (*q.v.*) have not yet been developed; the wide area between these and the wheat belt (*i.e.*, approximately around the Kalgoorlie goldfields) suffers from lack of good water-supply, though the after-growth of the cleared forests affords a fair pasturage. Along the west and north-west coasts, as far as about Port Hedland and also for some 150–250 m. inland the natural vegetation (mulga, salt-bush, grasses, etc.) affords pasture varying locally in quality but mostly good, and here also supplies of good sub-surface water are widespread. Recent progress has also been reported in the flocks of the northern area (Fitzroy basin around Derby). The far eastern interior has probably little pastoral value, but an enormous tract comprising the west-centre of the State (North-

ern Coolgardie, Murchison, Mount Margaret gold-fields areas up to *c.* lat. 25° S.) has excellent underground waters, good fodder, and is now one of the leading sheep areas. As settlement has advanced, so fencing, well-sinking, water-conservation (including the provision of stock-routes, *e.g.*, along the west coast; Hall's Creek–Wiluna, etc.), stock-management and breeding improve and become more widespread, though rabbits, and in some areas (*e.g.*, the Wandoo forest) poison plants, cause losses. Western Australia now carries some 8,500,000 sheep (nearly all merino) which yielded (1927) 59,350,000 lb. of wool, the average weight of fleece having advanced to *c.* 7·1 lb. or approximately the Commonwealth average, and the all-round progress in the industry has been marked. An indication of the distribution and relative importance of the sheep areas is afforded by the wool exports of their respective ports: (1928) Fremantle, 55,340,000 lb.; Geraldton, 2,230,000; Carnarvon, 1,710,000; Port Hedland, 1,430,000; Onslow, 270,000; Albany, 150,000; Roebourne, 96,000 lb. (See *Statistical Survey: Exports.*) *Cattle* for slaughter purposes are kept to some extent in the south-west and also in the rougher lands (*e.g.*, upper river basins) throughout the west interior wherever sufficient water and fodder are available. But by far the greater number of the State's 850,000 head are in the north (Fitzroy basin, with centre Derby) and in the extreme north-east (Antrim plateau and Ord basin, with centre Wyndham). Here plains (1,000–20,000 ac.) are interspersed with rougher ridge and hill country and the 30–50 in. summer rainfall produces rank, though not wholly satisfactory, fodder. Land and black labour are cheap and here is the region of vast cattle runs (500,000 ac. and upwards) held by such firms as Messrs. Bovril (Australia) Estates, Vestey Bros., etc. The Government freezing works at Wyndham are efficiently managed, they work for the five winter months (April–September) and deal with *c.* 25,000 head of cattle per season. The white workers (200–300) are brought up each season from Fremantle.

Note on the Northern Areas (Kimberley Division).—Mining has proved profitable, but the area has not been thoroughly tested. Pearl-shell fishing centring on Broome is of tried value (1925: 246 boats, employing 1,750 men [largely Asiatics], obtained *c.* 1,400 tons of pearl-shell [£210,000] and pearls [£60,300]). The proposal of the Commonwealth Government that the area should be handed over to Federal control was rejected. The air service (*see* below) marks an advance.

Towns, Manufacturing Industries, Communications, Trade.—The greater part of the interior of the State is, and will probably remain, apart from relatively impermanent mining centres, sparsely populated by human beings whatever its sheep and cattle population may ultimately be. Most of the increase is taking place around or near the coasts, the south-west corner being chiefly notable. In this zone of coastal, or sub-coastal, settlement ports naturally play a prominent part. Perth (*q.v.*), with its port Fremantle, holds a key position upon what is perhaps the most important part of the coast. Commercially if not physically it lies midway between north and south. Convenient to important goldfields and also to the still more important and developing south-west, it lies besides, upon or near a world sea-route and is terminal to the shortest land-route to the eastern States. With its population of *c.* 192,000 the metropolitan area contains nearly half of the total population of the State. Apart from Perth and some ports—of which Albany, Bunbury, Geraldton (*qq.v.*) may serve as examples—the towns of Western Australia generally known hitherto have been associated with mining (*e.g.*, Coolgardie—Kalgoorlie, *q.v.*). The settlements of the south-west, destined one day perhaps to become important are as yet mainly small agricultural and, usually also, railway centres of which in their youth it is perhaps sufficient to remark that they are numerous. *Manufactures,* in the stage of development indicated, are naturally confined mainly to the metropolitan—and particularly to the Fremantle (*q.v.*)—area, to the gold-fields, and to the primary producing centres (sawmilling; butter and cheese making; bacon curing; ore crushing and concentrating). Nevertheless, in the relative isolation of the community, industrial activity has made considerable progress in recent years, noteworthy being the manufacture of superphosphates and railway engineering (Midland Junction, etc.), while the supply of electrical power has also assumed large proportions (see *Statistical Survey: Manufacturing Industries*).

Communications.—Over large parts of the interior camels (1927: 4,837), mules and donkeys (1927: 10,300) still form indispensable means of transport, and in the northern interior the bullock-waggon has barely begun to yield to the motor-tractor. Elsewhere, as settlement and roads advance, or even before that stage, the flat terrain encourages motors while the aeroplane here, as in north-east Australia, must be looked upon as a pioneering vehicle. The Perth–Derby (1,467 m.) service, calling at Geraldton, Carnarvon, Onslow, Roebourne, Whim Creek, Port Hedland, Broome "en route," is carried out by West Australian Airways Ltd. subsidised by the Commonwealth Government. This company completed in June 1928 its first million miles of commercial flying and had then carried 1,250,000 letters and 70 tons freight with very little serious mishap but with almost untold benefits—including urgent medical assistance—to the settlers in the far north. In April 1929 will be inaugurated an air-service (by the same company, also with Commonwealth subsidy) from Perth–Adelaide with 4 large machines having a normal cruising speed of 105 miles per hour. *Railways* were first developed in the coastal lands behind Geraldton (Geraldton–Northampton, 1879), Albany–Fremantle to connect various mining, timber and agricultural areas with their ports and one another. Later the great mineral lines were run out far into the almost unknown interior—Perth to Kalgoorlie: 375m., with extension to Laverton, 586 miles; Geraldton to Meekatharra: 334 m.; to Sandstone: 309 m.; Perth to Meekatharra: 600 m., etc.; and in the north-west an isolated line, Port Hedland–Marble Bar: 114 m. These lines have also proved invaluable in opening up the pastoral interior. In the railway-system of the south-west, with its curious herring-bone pattern, can still be distinguished the timber, the mineral, and the agricultural lines, but the outstanding feature of recent construction is the development of wheat-belt lines reaching out long arms eastwards to draw grain and wool in to the main trunk systems (*cf.* the similar development in the South Australian Mallee [*see* SOUTH AUSTRALIA] and the Victorian Wimmera [*see* VICTORIA]). In the north these debouch upon Geraldton, but by far the greater number upon Fremantle. Of this development the Norseman–Esperance (*q.v.*; Kalgoorlie–Esperance: 258 m.) line now being completed is a logical continuation, as will be the extension across to it of the existing grid from the present rail-heads on the west (*see* above *re* the "3,000 farm scheme"). The Western Australian railways are, somewhat unfortunately, of narrow (3′·6″) gauge, and though like most Australian railways they are often built for developmental purposes (*see* AUSTRALIA: *Railways*), recent returns have been encouraging. The railways are mainly State-owned, but there are considerable lengths of private (mineral and timber) lines of semi-permanent nature but mostly open to general traffic. Of the transcontinental (Commonwealth Government, 4′·8½″) line, 454 m. lies in Western Australia, and, apart from its increasing passenger and goods services (*see* below), it will doubtless help to develop considerable areas of pastoral lands provided adequate (non-saline) water-supplies can be uncovered. (See *Statistical Survey: Railways.*)

ABORIGINES OF THE KIMBERLY DISTRICT, WESTERN AUSTRALIA

Trade, the general nature and extent of which can be gauged from the foregoing, and also from the appended statistics (*Trade; Shipping; Ports: see* also above *Pastoral Industries: wool exports*) has in recent years been increasing in volume and variety, Fremantle taking the lion's share. As an index of growth, therefore, the trade of this port is valuable.

Shipping Statistics

	1903–04	1927–28
Shipping tonnage (net) .	626,692	3,462,776
Cargo tonnage . . .	560,000	1,679,545
Revenue collected . .	£79,361	£581,849
Wheat shipped . . .	3,132 bags	5,683,104 bags
Flour shipped . . .	nil	52,132 tons
Shed floor space . .	72,000 sq.ft.	340,000 sq.ft.
Oil fuel bunkered . .	nil	103,583 tons

A considerable portion of Western Australian trade is with other Australian States and it is significant that in the year 1927–28 imports to the value of £621,000 entered Western Australia by the overland railway line from eastern States, while only £15,500 worth of exports proceeded east by that route. *Shipping* services include (*a*) the main overseas lines which now make Fremantle (not Albany) their first Australian port of call, and Fremantle is the largest oil-bunkering port in Australia; (*b*) services plying to other States; (*c*) coasting services plying, mainly, northwards up the coast and back. From Western Australia *submarine cables* connect (1) Broome through Java (Banjoewangie), etc., to London, Broome being connected by an overland line with Perth and thence, via Albany, Eucla, and Port Augusta, with South Australia and the eastern States, (2) Fremantle with Durban, (3) Fremantle–Adelaide (alternative to the overland line), (4) Broome via Java—as in (1)—and Cocos Island with South Africa.

Statistical Survey.—*Area and Land Occupation:* 975,920 sq.m. (624,588,800 ac.) = 32·81% of Commonwealth—364,000 sq.m. (= 37·3% of total area) within tropical zone. Coast-line: 4,350 miles. Alienated or in process of alienation (1928): 33,322,223 acres; leases and licences: 237,428,424 ac.; unoccupied: 353,838,153 ac. (pastoral leases: *c.* 233,400,000 acres; mining: *c.* 84,000 acres; timber: *c.* 1,676,000 acres).

Population (June 1928): 400,048 (males: 216,530; females: 183,518. In addition: aboriginals [1927]: *c.* 23,000) = *c.* 6·3% of population of Commonwealth, *c.* 0·4 persons per sq. mile. Birth rate: *c.* 22, death rate *c.* 9 per 1,000. Total increase, including immigration, (average 1923–27, five years): 9,700 per annum (1927: 13,546). Metropolitan (1927): *c.* 191,800 = *c.* 49% of total population in Perth and suburbs (87,563 acres).

Occupations (Census 1921: total population: 332,732): *Breadwinners*: 146,926, of whom: primary producers, 49,400; industrial, 32,794; commercial, 21,960; transport and domestic, each, *c.* 14,200; professional, 13,500.

Production (estimated annual value during last three years): *c.* £30,000,000. Agricultural: £10–11 millions; manufacturing, £5–6 millions; pastoral, £5,500,000; forestry and fisheries, £2,500,000; mining, £2,320,000; dairying, etc., £1,600,000.

Mining: (1926) Total: £2,720,400. Gold: £1,735,000 (78·75% of total Western Australian mining output and 64·7% of total Australian gold output) (sinking); silver and lead, £30,500 (fluctuating); tin, £13,300 (fairly constant); copper, nil (1923: £65,100); coal (1928) all Collie: 514,800 tons, £414,450 (rising).

Agriculture: Area devoted to cultivation and being cleared (1927): 10,475,000 ac. (under crop, 3,325,000 ac.; fallow, 1,677,000 acres). Wheat: 2,571,000 acres; 30,022,000 bu. (11–12 bushels per acre) (1928: *c.* 3 million acres, 35,134,000 bushels). Hay: 359,000 ac., 424,000 tons. Oats: 235,000 ac., 2,717,000 bushels. Orchards: 18,500 acres. Vineyards: 5,275 ac., 292,000 gal. wine.

Pastoral and Dairying (1927): Horses, 165,000; cattle, 847,000; sheep, 8,448,000; pigs, 59,800. Production (1926–27): butter, 3·83 million lbs.; bacon and ham, 2·7 million lbs.

Manufacturing Industries: Factories (1926–27): 1,216, employing 20,424 hands. Value added by process: £6,907,000. Food and drink factories 212 (employing 2,725 hands); clothing, 167 (3,150 hands); wood-working, 161 (5,775 hands); machinery, etc., 147 (4,000); vehicles, saddlery, etc., 137 (1,240).

Trade, Commerce, Communications: (*a*) *Trade:* Total (1927–28): £36,528,650. *Exports:* £18,240,775. Value per caput (1926–27): £39·95. (Interstate: £1,345,000; overseas, £16,896,000.) *Wheat:* £6,994,500 (15,716,000 centals); flour, £1,008,000 (1,708,000 centals). *Wool:* £4,963,000 (61,244,600 lb.). *Timber:* £1,265,000; sandalwood, £147,000. *Cattle products:* beef: £136,000 (11 million lb.); hides, etc., £553,000. *Gold:* £660,700. *Fruit:* £192,000; *Pearl shell:* £186,000. *Imports:* £18,287,876. Value per caput (1926–27): £48·45. (Interstate: £9,276,329; overseas, £9,011,547.) Clothing, etc., £4,039,000; machinery, etc., £2,100,000; hardware, £1,535,000; motors, etc., £1,165,000; dairy products, £1,105,000; tobacco, etc., £715,000.

(*b*) *Shipping* (all categories: 1926–27): Cleared: 799 vessels (3,796,500 tons). Cargo: discharged, 793,650 tons; shipped, 1,000,800 tons. Total overseas cargoes (discharged and shipped): 1,401,000.

(*c*) *Ports:* Total trade (1927–28); Fremantle, £30,639,000; Bunbury, £2,256,700; Geraldton, £1,124,100; Albany, £708,000, Wyndham, £263,500; Carnarvon, £253,000; Busselton, £213,500; Broome, £195,200; Port Hedland, £109,200.

(*d*) *Railways.* State Government lines (1928): 3,977 m. (3′ 6″ gauge). Commonwealth Government (transcontinental line, Western Australian section Kalgoorlie—South Australian border): *c.* 454 m. (4′ 8½″ gauge). In addition, *c.* 884 m. private railways (mainly 3′ 6″), of which *c.* 277 m. open for general traffic. The State railways in 1928 showed a net profit of £26,671. During 1928, 152 miles were under construction, surveys for 240 m. (Government lines) were completed and surveys for 294 m. were in progress.

Finance (1927–28): Revenue: £9,807,950 (£25·009 per caput); expenditure: £9,834,410 (£25.076). Public debt (net): £67,528,626; average interest payable: 4·52%; £168.801 per caput. Cheque-paying banks (10): liabilities (2nd quarter, 1928): £18,223,851; assets, £22,138,245. Commonwealth Savings Bank (W.A.) (1928): deposit accounts: 87,980, amounting to £2,823,500 (£32.092 per deposit). State Savings Bank: deposits, *c.* 189,000; £7,695,935 (*c.* £40.250 per caput). Schools Savings Bank: deposits: 51,860; £89,890 (£1.732 per caput). (O. H. T. R.)

See: E. de C. Clarke: "Natural Regions in Western Australia" in *Journal Royal Soc. Western Australia,* vol. xii., No. 14 (1926); W. C. S. McLintock: *The Swan Geography* (1923); *Western Australia: An Official Handbook* (1925).

HISTORY

Both the western and northern coasts of the colony are pretty accurately laid down on maps said to date from 1540 to 1550, where the western side of the continent terminates at Cape Leeuwen. The discovery of the coast may be attributed to Portuguese and Spanish navigators, who were in the seas northward of Australia as early as 1520. The Dutch explored the coast in the 17th and the French in the 18th century.

The earliest settlement was made from Port Jackson, at the end of 1825, when, owing to a fear that the French might occupy King George sound, Major Lockyer took formal British possession of it with a party of convicts and soldiers, 75 in all, though Vancouver had previously done so in 1791. Yet the Dutch had long before declared New Holland, which then meant only the western portion of Australia, to be Dutch property. This convict establishment returned to Sydney in 1829. In 1827 Captain Stirling surveyed the coast from King George sound to the Swan river, and Captain Fremantle, R.N., in 1829 took official possession of the whole country. Stirling's account stimulated the emigration ardour of Sir F. Vincent and Peel, Macqueen, etc., who formed an association, securing from the British Government permission to occupy land in Western Australia proportionate to the capital invested, and the number of emigrants they despatched thither. In this way Mr. Peel had a grant of 250,000ac., and Colonel Latour of 103,000. Captain (afterwards Sir James) Stirling founded the Swan River Settlement, the towns of Perth and Fremantle, and was appointed lieutenant-governor in 1829. The people were scattered on large grants. The land was poor, and the forests heavy, provisions were at famine prices; and many left for Sydney or Hobart Town. The overland journey of Eyre from Adelaide to King George sound in 1839–40, through a waterless waste, discouraged settlers; but Grey's overland walk in 1838 from Shark's bay to Perth revealed fine rivers and good land in Victoria district, subsequently occupied by farmers, graziers and miners. The difficulties of the settlers had compelled

them to seek help from the British treasury, in the offer to accept convicts. These came in 1850, but transportation ceased in 1868, in consequence of loud protests from the other colonies.

The progressive history of Western Australia may be said to commence in 1870, with the beginning of partial representative government under the presidency of Governor Sir Frederick Weld. The colony was fortunate in possessing two explorers of the best practical type—the brothers, John and Alexander Forrest. The object of their expeditions was to find more land available for pastoral or agricultural settlement. Perhaps the most famous of these journeys was that accomplished by Mr. (afterwards Sir) John Forrest between Eucla and Adelaide in 1870. Other explorers—notably Mr. Ernest Giles, the Gregorys and Mr. Austin—also contributed to the growing knowledge of the resources of the vast territory. In 1882 the government geologist reported indications of auriferous country in the Kimberley district, and the first payable goldfield was shortly afterwards "proclaimed" there. Within five years goldfields were proclaimed at Yilgarn, about 200m. to the east of Perth, and the discovery of patches of rich alluvial gold in the Pilbarra district quickly followed, but the rush for the Coolgardie and Kalgoorlie goldfields did not begin until 1893.

A bill enabling the queen to grant a constitution to Western Australia received the royal assent on Aug. 15, 1890. This provided for a governor, a legislative council and a legislative assembly, the two bodies to be appointed by the governor until the population reached 60,000. In 1893 the Colonial Parliament passed an act so amending the constitution.

For a long time the advantages of federation were not so apparent to the people of Western Australia as to those of the eastern colonies. They were slow to grasp the principles of the bill framed at the Federal Convention which had held its sittings since 1886 in Adelaide, Sydney and Melbourne; and they hesitated to join the Commonwealth without receiving a pledge for the retention of their own customs dues for five years. Early in 1900 Sir John Forrest as premier made an unsuccessful attempt to obtain this concession. On a referendum of the electors, a majority of over 25,000 votes decided in favour of federation, as the Constitution Act provided that this state should have the right to enact her own tariff as against the sister states for the desired five years, decreasing annually at the rate of one-fifth of the amount of the original duty until the whole disappeared. By two Constitution Acts, Amendment Acts (1899 and 1911), the legislative council is limited to 30 members representing 10 electoral provinces. The members retain their seats for six years, must be 30 years of age, have had two years' residence in the state, and be either natural-born British subjects or naturalized for five years. The legislative assembly consists of 50 members, elected for three years.

WESTERN INDIA STATES AGENCY, an agency for Indian States in Kathiawar, Cutch and Palanpur, formed in 1924. The States included are Bhavnagar, Cutch, Dhrangadhra, Dhrol, Gondal, Jafarabad, Junagadh, Demdi, Morvi, Nawanagar, Palanpur, Palitana, Porbandar, Radhampur, Rajkot, Wadhwan, Wankaner. Formerly under Bombay, they now have direct relations with the Imperial Government through an agent in Rajkot.

WESTERN PACIFIC RAILROAD CORPORATION, THE, incorporated under the laws of Delaware, on June 29, 1916, is a holding company and the owner of the entire preferred and common capital stock, except directors' qualifying shares, of the Western Pacific Railroad Company (the operating company). The corporation, along with other valuable assets, owns a one-half interest, or 150,000 shares of the no-par value common stock of the Denver and Rio Grande Western Railroad Company, as well as the equity in 50,000 shares or one-half of the capital stock of Utah Fuel Company. The capital structure of the corporation is as follows: Capital stock, 6% preferred (par $100), $40,000,000 outstanding; common stock (par $100), $60,000,000 outstanding. The funded debt consists of $5,175,000 in 4% gold notes, due Oct. 1, 1930.

For the year 1927, the Western Pacific Railroad Company, subsidiary of this corporation, showed total operating revenue of $16,433,463, the largest in the history of the company.

Beginning early in 1927, the operating company began an extensive programme of improvements covering the next few years; this contemplated an expenditure of approximately $18,000,000, of which $10,000,000 will be charged to operating expenses, the balance to capital. In addition, a further expansion of this programme was decided upon in 1928 under which it was proposed to extend and improve present facilities and to acquire or to construct new lines to serve territory not adequately provided with transportation. This second programme involved the additional expenditure of approximately $24,000,000, all with the ultimate objective of placing the properties in a position to compete properly with other transcontinental lines and to take care of anticipated increase in business. (M. J. C.)

WESTERN UNION TELEGRAPH COMPANY, THE, was incorporated in New York, April, 1851, as *The New York and Mississippi Valley Printing Telegraph Company* to construct, own and operate a telegraph line from Buffalo, N.Y., to St. Louis, Mo., via Cleveland, Columbus and Cincinnati. The capital was fixed at $360,000. In 1856 the name was changed to *The Western Union Telegraph Company.* By construction, consolidations (more than 535 telegraph companies having been absorbed) and extensions, the plant and business grew until on Jan. 1, 1929 the capital stock was $105,000,000; the funded debt $73,005,000; the plant comprised 216,169 m. of pole lines; 1,852,069 m. of wire; 3,545 m. of landline cables; 30,680 knots of ocean cables; 24,842 telegraph offices. For the year 1928 operating revenues were $131,771,000 and expenses were $120,310,255. The company's telegraph service is universal in the United States, and through its cable system extends to Great Britain and Europe, South America, West Indies, Mexico and Canada. By connections it goes to all parts of the world. (N. C.)

WESTER WEMYSS, ROSSLYN ERSKINE WEMYSS, 1ST BARON cr. 1919, G.C.B., 1918, (1864–), British sailor, was born in London on April 12, 1864. He entered the navy in 1877. Rear-admiral of 2nd Battle Squadron 1912-13 and of the 12th Cruiser Squadron 1914, he was made vice-admiral 1916 and admiral of the fleet 1919. He commanded a squadron during the landing of the British troops in Gallipoli (1915), was commander-in-chief in the East Indies and Egypt (1916–17), deputy first sea lord, and afterwards first sea lord of the Admiralty (1917–19) and a member of the War Cabinet (1918). In 1924 he published *The Navy in the Dardanelles Campaign.*

WESTFIELD, a city of Massachusetts. Pop. (1920) 18,604 (24% foreign-born white); 1928 local estimate 22,000. The streets of the city are arched with fine old elms. It is the seat of a State normal school (1844). Its manufactures (including boilers and radiators, paper, envelopes, bicycles and baby carriages, underwear, thread and pasteboard boxes) were valued at $13,733,236 in 1925. The manufacture of whips and lashes, begun early in the 19th century and engaging more than 40 concerns at its height, was the city's leading industry until the multiplication of automobiles cut down the market. Westfield academy (1800–66) was a famous secondary school. A trading post known by the Indian name Woronoko was established here about 1640, and in 1669 Westfield was set off from Springfield and incorporated. It was incorporated in 1914, but rejected the act; and again in 1920, accepting 1921. There is a municipal airport.

WESTGATE-ON-SEA, a watering-place in the Isle of Thanet. Pop. (1921) 5,096. There are gardens and promenades over 1 m. in length, a marine drive along the cliffs, and golf links. BIRCHINGTON, to the west (pop. 3,503), is also a growing resort. The church of All Saints is Perpendicular, with an Early English tower, and contains some interesting monuments.

WEST HAM, a borough of Essex, England, forming an eastward suburb of London. Pop. (1921) 300,810. The old church of All Saints has a good Perpendicular tower, and in the restoration of 1866 some early mural painting was discovered, and a Transitional Norman clerestory, remaining above the later nave. West Ham Park (80 ac.) occupies the site of Ham House, the residence of Samuel Gurney, the banker and philanthropist. Few large houses now remain, but the smaller houses have greatly increased.

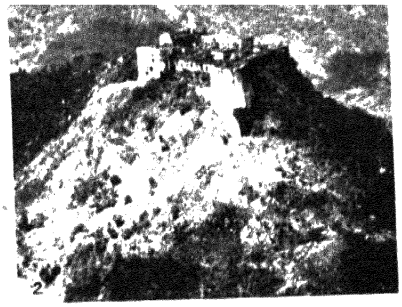
Within the borough are the extensive railway works of the L.N.E. railway at Stratford. This industrial centre is continued eastward to East Ham, where the old village church of St. Mary Magdalene retains Norman portions.

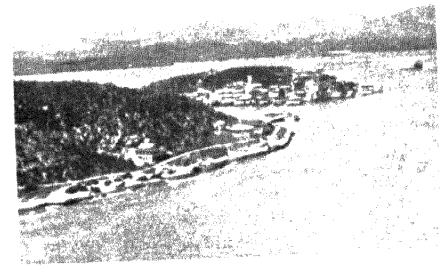
At the time of the Conquest West Ham belonged to Alestan and Leured, two freemen, and at Domesday to Ralph Gernon and Ralph Peverel. It received the grant of a market and annual fair in 1253. The lordship was given to the abbey of Stratford, and, passing to the Crown at the dissolution, formed part of the dowry of Catherine of Portugal, and was therefore called the Queen's Manor. It was incorporated in 1886. West Ham returns 4 members to parliament.

WEST HAVEN, a town of Connecticut, U.S.A. Population over 20,000 in 1928. It is mainly a residential and industrial suburb of New Haven. Savin Rock, rising out of Long Island sound, is a popular pleasure resort. West Haven was taken from New Haven in 1822 and united with North Milford to form the town of Orange. It was incorporated as a borough in 1873; reverted to Orange town after 1910; and in 1921 was incorporated as an independent town.

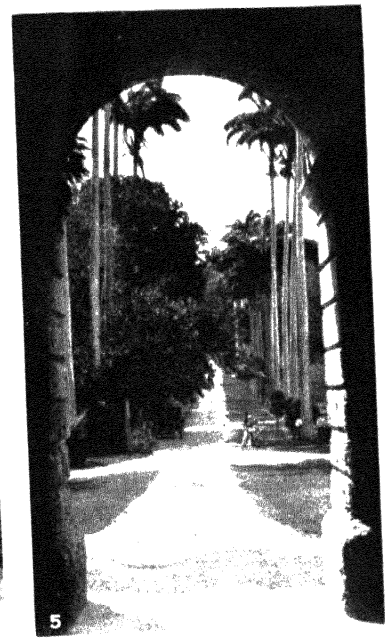
WEST INDIES, THE, sometimes called the Antilles (*q.v.*), an archipelago stretching in the shape of a rude arc or parabola from Florida in North America and Yucatan in Central America to Venezuela in South America, and enclosing the Caribbean sea (615,000 sq.m.) and the Gulf of Mexico (750,000 sq.m. in area). The land area of all the islands is nearly 100,000 sq.m., with an estimated population of about 9 millions; that of the British islands about 12,000 square miles. The islands differ widely one from another in area, population, geographical position and physical characteristics. They are divided into the Bahamas, the Greater Antilles (Cuba, Jamaica, Haiti and Porto Rico), and the Lesser Antilles (comprising the remainder). The Lesser Antilles are again divided into the Windward islands and Leeward islands. Geographically, the Leeward islands are those to the north of St. Lucia, and the Windward, St. Lucia and those to the south of it; but for administrative purposes the British islands in the Lesser Antilles are grouped as is shown in the table given later.

Geology.—The West Indies are the summits of a submerged mountain chain, the continuation of which towards the west must be sought in the mountains of Honduras. In Haiti the chain divides, one branch passing through Jamaica and the other through Cuba, the Cayman islands and the Misteriosa Bank. In Cuba and Haiti there are schists which are probably of pre-Cretaceous age, and have, indeed, been referred to the Archaean; but the oldest rocks which have yet been certainly identified in the West Indies belong to the Cretaceous period. Throughout the Greater Antilles the geological succession begins, as a rule, with volcanic tuffs and conglomerates of hornblende-andesite, etc., in the midst of which are intercalated occasional beds of limestone with *Rudistes* and other Cretaceous fossils. These are overlaid by sediments of terrigenous origin, and the whole series was folded before the deposition of the next succeeding strata. The nature of these Cretaceous deposits clearly indicates the neighbourhood of an extensive area of land; but during the succeeding Eocene period and the early part of the Oligocene, a profound subsidence led to the deposition of the Globigerina chalks and white Radiolarian earths of Jamaica, Cuba and Haiti. The Greater Antilles must, at this time, have been almost completely submerged, and the similar deposits of Barbados and Trinidad point to a similar submergence beyond the Windward islands. In the middle of the Oligocene period a mighty upheaval, accompanied by mountain folding and the intrusion of plutonic rocks, raised the Greater Antilles far above their present level, and united the islands with one another, and perhaps with Florida. A subsequent depression and a series of minor oscillations finally resulted in the production of the present topography.





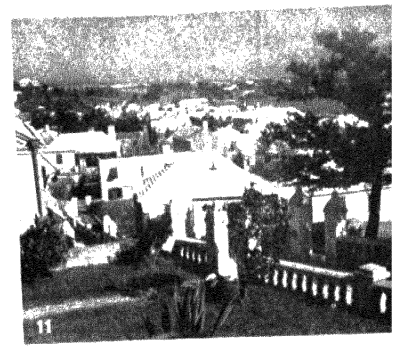
The geology of the Lesser Antilles is somewhat different. In some of the islands there are old volcanic tuffs which may possibly be the equivalents of the Cretaceous beds of Jamaica, but volcanic activity here continued throughout the Tertiary period and even down to the present day. Another important difference is that except in Trinidad and Barbados, which do not properly belong to the Caribbean chain, no deep-sea deposits have yet been found in the Lesser Antilles and there is no evidence that the area ever sank to abysmal depths.



The mineral wealth of the islands is not remarkable. Gold, silver, iron, copper, tin, platinum, lead, coal of a poor quality, cobalt, mercury, arsenic, antimony, manganese and rock salt either have been or are worked. Asphalt is worked to considerable advantage among the pitch lakes of Trinidad. Opal and chalcedony are the principal precious stones.

Climate.—As in most tropical countries where considerable heights are met with—and here over 15,500 sq.m. lie at an elevation of more than 1,500 ft. above sea-level—the climate of the West Indies (in so far at least as heat and cold are concerned) varies at different altitudes, and on the higher parts of many of the islands rather low temperatures are found. These islands all lie in the path of the north-easterly trade winds and their climatic conditions are typical of islands in this belt. With the exception of part of the Bahamas, all the islands lie between the annual isotherms of 77° and 82° F. The climate, however, is everywhere marine, and the extreme heat is greatly tempered by the steady trades, by the daily sea breezes, and by cool, refreshing nights. Frost occasionally occurs in the cold season, but snow is unknown. The seasons may be divided as follows: The short, wet season, or spring, begins in April and lasts from two to six weeks, and is succeeded by the short dry season, when the thermometer remains almost stationary at about 80° F. In July the heat increases and continues until September or October, when the great rainfall of the year begins, accompanied frequently by tremendous and destructive hurricanes. This season is locally known as the "hurricane months." The annual rainfall averages about 60 inches. December marks the beginning of the dry season, which, accompanied by fresh winds and occasional showers, lasts till April. The average temperature of the air at Barbados, which may be taken as typical, is, throughout the year, 80° F in the forenoon, and about 82° in the afternoon. The maximum is 87°, and the minimum 75°.

Flora.—The flora of the islands is of great variety and richness, as plants have been introduced from most parts of the globe, and flourish either in a wild state or under cultivation; grain, vegetables and fruits, generally common in cool climates, may be seen growing in luxuriance within a short distance of like plants which only attain perfection under the influence of extreme heat, nothing being here required for the successful propagation of both but a difference in the height of the lands upon which they grow. The forests, which are numerous, produce the most valuable woods and delicious fruits. Palms are in great variety, and there are several species of gum-producing trees. Some locust trees have been estimated to have attained an age of 4,000 years, and are of immense height and bulk. Pimento is peculiar to Jamaica. For centuries almost the whole care of the planters was bestowed upon the cultivation of the sugar-cane and tobacco plant, but in modern times attention has been turned to the production of other and more varying crops. Crops of tobacco, beans, peas, maize and Guinea corn are popular, and a species of rice, which requires no flooding for its successful propagation, is largely produced. *Hymenachne striatum* covers many of the plains, and affords food for cattle.



Fauna.—The fauna of the region is Neotropical, belonging to that region which includes South and part of Central America, although great numbers of birds from the North American portion of the Holarctic realm migrate to the islands. The resident birds, however, 18 genera of which are certainly Neotropical, show beyond doubt to which faunal region the islands properly belong. The non-migrating birds include trogons, sugar-birds, chatterers, and many parrots and humming birds. Waterfowl and various kinds of pigeons are in abundance. Mammals are, as in most island groups, rare. The agouti abounds, and wild pigs and dogs are sufficiently numerous to afford good sport to the hunter, as well as smaller game, in the shape of armadillos, opossums, musk-rats and raccoons. Reptiles are numerous: snakes—both the boa and adder—are innumerable, while lizards, scorpions, tarantulas and centipedes are everywhere. Insects, too, are very numerous, and

SCENES IN THE WEST INDIES

1. View of St. Thomas (Charlotte Amalie), the only town on the U.S. island of St. Thomas. It is a coaling station and possesses one of the finest harbours in the West Indies
2. "La Ferrière," the citadel of Henri Christophe (ruled 1811–20), second negro king of Haiti. Erected on a peak near Cape Haitien, this citadel is a remarkable monument to the early years of the first State in the world governed constitutionally by negroes
3. Aerial view of the coast of Cuba, the largest island and one of the three republics of the West Indies, estimated area, 41,634 sq.m.
4. Weaving hats in Curaçao. The island has been a Dutch possession since 1634 and the principal town, Willemstad, is built in the Dutch style. The negroes speak a curious dialect consisting of Spanish, English, Dutch and native words
5. The grounds of Codrington College at Bridgetown, capital of Barbados, a British island, the most easterly of the West Indies, area 155 sq. m. The college was founded by Col. Christopher Codrington (1668–1710) and is affiliated with the University of Durham
6. Natives on the way to market in Martinique, a French colony of the Lesser Antilles, area 380 sq.m.
7. Typical hut and peasants (*jibaros*) in Porto Rico. The houses, which never contain more than one room, are raised on poles as protection against insects, and thatched with grass and palm leaves
8. Country scene in Porto Rico, most easterly of the Greater Antilles, and a possession of the United States
9. Native hut in Jamaica. *Jaymaca* is a native word, meaning the island of springs
10. Cutting and loading sugar cane in Porto Rico. The cultivation of sugar cane, successfully undertaken throughout the islands, is an important industry of Porto Rico, where sugar has been produced since 1548
11. View of St. George, a town on the island of the same name in the Bermudas. About 680 m. from the American coast, the Bermudas are much visited for health and pleasure

re often annoying. Among domestic animals mules are largely eared, and where the country affords suitable pasture and forage attle-breeding is practised. Goats abound, and large flocks of heep are kept for the sake of their flesh alone, as the climate s not adapted for wool-growing.

Area and Population.—The following list of the West Indian ılands gives their area and population:—

Name	Area, square miles	Population, 1921
British—		
Bahamas	4,404	53,031
Jamaica	4,207	858,188
Turks island	224	5,612
Leeward islands:		
Virgin islands	58	5,082
St. Kitts, Nevis and Anguila	150	38,214
Antigua, Barbuda and Redonda	108	29,767
Montserrat	32	12,120
Dominica	305	37,059
Barbados	166	156,312
Windward islands:		
St. Lucia	233	53,221 (1922)
St. Vincent	150·3	46,220 (1922)
Grenada	133	66,302
Trinidad	1,862	365,913
Tobago	114	
French—		
Guadeloupe, St. Martin (part), etc.	688	229,839 (1922)
Martinique	385	244,439
Dutch—		
St. Martin (part)	17	2,527 (1922)
Curaçao	210	34,482 (1922)
Bonaire	95	8,829 (1922)
Aruba	69	7,288 (1922)
St. Eustatius	7	1,213 (1922)
Saba	5	1,699 (1922)
United States—		
St. Thomas	28	10,191 (1917)
St. John	20	959 (1917)
St. Croix	84	14,901 (1917)
Porto Rico	3,435	1,299,809 (1920)
Republics—		
Haiti	10,204	2,045,000 (1923)*
Cuba (and adjacent islands)	44,164	3,123,040 (1922)
Dominican Republic	19,332	897,405

*Estimate.

Racially, the character of the West Indies has undergone a ıarked transformation since their occupation by European na- ions. The aboriginal race has almost entirely disappeared. Only n a few of the islands, particularly St. Vincent and Dominica, re there natives left. Even here they are but few in number and f mixed race rather pure-blooded. Elsewhere the West In- ian Carib is virtually extinct. His place has been taken only ı part by the invader. Although the white race (either from Spain r north-western Europe) was the conqueror and first settler on ll of the islands, and although for a century or so it seemed hat the West Indies, like the mainland of the New World, would ecome filled with a European population, most of the islands ave not proved suitable for permanent settlement by this race. n Cuba and Porto Rico the whites have become firmly estab- shed and now constitute about 75% of the total population. But pon all the other islands the white race has failed to hold its wn. In nearly every other part of the archipelago Africans now astly outnumber all other races. These people, brought in to ıeet the needs of tropical agriculture, have survived the condi- ions presented by the tropics far better than their masters, and he West Indies have become virtually a racial extension of ıfrica. In the republic of Haiti some nine-tenths of the popula- ion are negroes and the remaining tenth is mulatto. In Martinique nly about 1% is not black or coloured (mulatto). In Barbados he negroes outnumber the whites eight to one. According to the ensus of 1921 there were in Jamaica 817,643 coloured and black,) 14,476 whites. Most of the other islands present a similar ıcial composition. In the Dutch islands, in some of the Bahamas nd in Trinidad the proportion of negroes is somewhat smaller.

Government.—The British West India colonies are either Crown colonies—that is to say, their government is absolutely under the control of the British Colonial Office, the official members of their councils predominating, and the unofficial members being nominated by the Crown, as in the Windward and Leeward islands—or they have a measure of representative government, as in the Bahamas, Barbados and Jamaica, in which all or part of the legislatures are elected and are more or less independent of Crown control. The laws of the various colonies are English, with local statutes to meet local needs. The governors and high officials are appointed by the Crown; other officials are appointed by the governor. Each governor acts under the advice of a privy council. In matters of detail the colonies present a variety of forms of government. (*See* the separate articles.) Federation has been widely discussed and is held desirable by many, but in view of the insular character of the colonies, the considerable distances separating some of them, and in many instances the lack of common interests (apart from certain broad issues), the project appears to be far from realization.

The only fortified places in the British West Indies are Jamaica, Barbados and St. Lucia—all of importance as coaling stations. In many of the islands there are local volunteer forces.

In the French islands the Guadeloupe group and Martinique have each a governor-general and an elective council, with, furthermore, representation in the French parliament. The Dutch colonies are governed much as are the English, but have less share in the administration. Porto Rico is organized as a territory of the United States, having a governor appointed by the President of the United States, a local legislature of senate and house of representatives elected by popular vote, and is represented in the national Congress by a resident commissioner. The government of the Virgin islands of the United States is civil, not military or naval, and consists of a governor appointed by the President of the United States, aided by a colonial council in each municipality. In most matters Danish law still prevails.

Economic Conditions.—The West Indian islands have suffered from periods of severe economic depression, though from the early years of the 20th century there has been good evidence of recovery and development. An obvious reason for temporary depression is the liability of the islands to earthquakes and hurricanes, in addition to eruptions in the volcanic islands, such as those in St. Vincent and Martinique in 1902.

The islands do not offer opportunities for ordinary labouring immigrants. Barbados is the only island where the land is entirely settled, but the settlement, planting and development of lands elsewhere involve a considerable amount of capital, and manual labour is provided by the natives or East Indian coolies. Attempts to settle European labourers have been unsuccessful.

Besides sugar, the principal products of the islands are tobacco, coffee, cocoa, fruits and cotton. Grenada is almost entirely, and Trinidad, Dominica and St. Lucia are largely, dependent upon cocoa. The fruit and spice trade is of growing importance, and there is a demand for bottled fruit in Canada and elsewhere. The variety of fruits grown is great; the bananas and oranges of Jamaica, the limes of Montserrat, Dominica and St. Lucia, and the pine-apples of the Bahamas may be mentioned as characteristic. It must be borne in mind, however, that the islands as a whole cannot be said to possess a community of commercial interests. Even the industries already indicated are by no means equally distributed throughout the islands; moreover, there are certain local industries of high importance, such as the manufacture of rum in Jamaica, the production of asphalt and the working of the oil-fields in Trinidad, and the production of arrowroot in St. Vincent. Sponges are an important product of the Bahamas, and salt of the Turks islands. Rubber plantations have been successful in several islands, such as Trinidad, Dominica and St. Lucia. (*See* further articles on the various islands.)

Modern Developments in the British West Indies.—The World War and the boom which followed brought about a remarkable temporary access of prosperity to the British West Indies, their total trade rising from £20,993,559 in 1913 to £54,691,648 in 1920. The chief staples, sugar, rum, molasses, cacao, cotton

and arrowroot, all commanded greatly enhanced prices. The total exports are about £15,000,000; imports about £20,000,000.

The Sea Island cotton industry, which owed its development in the West Indies to the ravages of the boll-weevil in the United States, received a check in 1920, through the appearance of the still more dreaded boll-worm in St. Kitts and Montserrat, to which it was brought by a Brazilian vessel. A comparatively new industry, which has made rapid progress in British Guiana, is that of rice. The colony used to import large quantities of rice for the Indian immigrants, but in 1905 was already able to cover her own requirements and in 1926 exported rice to the value of £44,000.

Almost as rapid has been the development of the petroleum industry in Trinidad. The existence of petroleum deposits in Trinidad has long been recognized. As far back as 1864 oil was struck, but it proved impossible to make a financial success of the enterprises concerned. About 1900 Mr. Randolph Rust, a local resident (mayor of Port of Spain in 1921), imported modern oil-boring machinery and successfully struck oil at Aripero in 1901. Other prospectors came on the scene, and in 1910 followed the successful flotation of the Trinidad oil-fields, and Trinidad enjoyed an extraordinary boom. The new industry, which was officially inaugurated in 1911, developed rapidly. With many new wells being drilled it is certain that the production of oil, which in 1927 amounted to 5,200,000 barrels and in 1928 to about 6,200,000, will undergo further material expansion.

As the outcome of the report of a committee appointed by Lord Milner in 1919, the Imperial College of Tropical Agriculture was founded in 1921, with headquarters at St. Augustine, about 7 m. E. of Port of Spain, Trinidad. An important feature of the college is the provision for research and investigation work which its laboratories and fields afford. The site was given by the Government of Trinidad and Tobago, whose planters gave £50,000 towards the erection of the college building. Maintenance is provided for by Imperial grants and contributions from the Governments of certain West Indian and West African colonies. Attached to the college is an instructional sugar factory, towards which the British sugar machinery firms contributed plant to the value of £20,000.

Imperial Preference.—The British Finance Act of 1918 provided for the granting of a preference of one-sixth off the duties on sugar, molasses, tobacco, coffee, cacao and other products imported from within the Empire into the United Kingdom, and a preference of 2s. 6d. per gallon on rum. The preference on sugar was increased in 1925 and stabilized for 10 years by the Finance Act of 1925.

Canadian Preference.—Following an inquiry in 1909 by a Royal Commission, a conference was held at Ottawa in 1912 between representatives of the Dominion and the British West Indian colonies, the Bahamas, British Honduras and Jamaica excepted, to consider the question of closer trade. On April 9, 1912 a reciprocal trade agreement was signed, the basis of which was a mutual preference of 20% on the chief products of the countries concerned.

In 1920 a second conference was held at Ottawa at which all the West Indian colonies, and also the Imperial Government, were represented. A new agreement was signed on June 18, 1920, and brought into force in May 1921, under which Canada agreed to give to British West Indian products a tariff preference of 50%, whilst the British West Indies similarly agreed to extend to Canadian products tariff preference of 50% in the case of Barbados, British Guiana and Trinidad, 33⅓% in that of British Honduras, the Leeward Islands and the Windward Islands, 25% in Jamaica and 10% in Bahamas, the legislature of which colony afterwards voluntarily increased the preference to one of 25%. Certain products were specifically dealt with, the preference on Canadian flour entering the West Indies being not less than 1s. per 196 lb., and that on West Indian sugar being not less than 83·712 cents per 100 lb. on 96° test.

In 1925 a new and more comprehensive agreement was signed under which West Indian produce (other than tobacco, cigars and alcohol) was to enjoy a preference of 50% off the full duty on entering the Dominion. Canada was to withdraw the benefit of the British preferential tariff from any British colony producing cacao beans which did not extend to her a satisfactory reciprocal preference. She was to admit, free of duty, bananas produced in British colonies and impose a duty of 50 cents per bunch on foreign bananas. The West Indies on their part were to give increased tariff preferences, namely 2s. per barrel or bag of 196 lb. of Canadian flour, and in the case of Jamaica, the Bahamas and British Honduras a preference not less than 30% on dairy products, meat and apples, and in the other colonies a preferential duty of not less than one-third of the general rate. With a guarantee against loss ensured by the colonies, Canada has undertaken to maintain new freight, mail and passenger services among the West Indian group. (X.)

ARCHAEOLOGY

At the time of Columbus the West Indian groups of islands were inhabited by tribes of two distinct South American ethnic stocks; the Greater Antilles by a branch of the Arawak people (known as Tainan); the Bahamas by another Arawak branch (the Lucayan); and the Lesser Antilles by the Carib.

The West Indies, in the first instance, seem to have been populated by a wave of Arawak immigration, followed by a second wave of Carib immigrants, who, by the end of the fifteenth century had exterminated the male population of the Lesser Antilles, and had even obtained a foothold on the eastern end of Porto Rico. The culture of the two races appears to have been very similar, though the Tainan were superior in craftsmanship. The Carib practised cannibalism, a custom which was rare (even if it existed at all) among the Tainan. It is possible that certain Maya influences from Yucatan had affected the ethnography of, at any rate, western Cuba; and there are indications that the Lucayan inhabitants of the Bahamas were in touch with the tribes of Florida, though, in this case, they appear to have given more than they received. The Tainan lived under the rule of a number of hereditary chieftains, known as *Cacique*, whose rule was mildly despotic, who were leaders in war, and also exercised certain priestly functions. Inheritance of rank seems to have passed to the eldest son, or failing male issue to the eldest son of the late Cacique's sister. As to property, among the general populace, the sister's son was the normal heir. The Carib organization appears to have been rather more democratic. The chiefs were essentially war-leaders, and the adult members of the *Carbet* (or "Men's House") constituted a sort of council. Chieftainship was not necessarily hereditary, but depended to a great extent on personal prowess. The difference was the natural outcome of circumstances. The surviving Tainan had been in long occupation of the larger islands, and were comparatively sedentary. The Carib, with only small islands at their disposal, were still a semi-migratory people, engaged in the conquest of fresh territory. Though all the islanders practised agriculture (maize being the most important crop), cultivation played a more important part in Tainan culture, while the fishing industry was more important among the Carib. Carib organization, which was devised to provide for long fishing-excursions or military raids, gave rise to rumours of "Amazon" tribes in the Caribbean, since the early explorers occasionally encountered islands peopled, apparently, only by women. Again, the practice of the Carib of taking the Arawak women as wives, after killing the men, led to a dual linguistic system on certain islands; the women (and their daughters) speaking Arawak, while the men and elder boys (who from an early age accompanied their fathers in their various voyages) spoke Carib.

The religion of both peoples was a form of nature-worship. A number of aetiological myths have been preserved, mostly of a very inconsequential nature (for details *see* bibliography). Certain high powers, connected with the sky and rain, were pro-

pitiated, and the spirits of ancestors and tree-spirits, were objects of common worship. Most of the idols fall under the class of "fetishes," to which the word *Zemi* was applied. This term is almost exactly parallel to the Peruvian word *Huaca,* and has as wide a connotation, including both the great powers, and images of wood and cotton (the latter often enclosing the bones of ancestors), and amulets and even ceremonial paintings on the body. Both Tainan and Carib were expert in the handling of stone, though the former were superior. The practice of flaking was practically non-existent, and implements and ceremonial objects were prepared by polishing. The comparative superiority of the Tainan rested to a great extent on the fact that they had access to a larger, and more varied, supply of raw material. In fact on certain of the Carib islands (notably Barbados) workable stone was non-existent, and implements were carved from fossil shell. Certain stone products of the Tainan artisan show remarkable proficiency, especially the large "horse-collar" fetishes (principally from Porto Rico, and probably connected with tree-worship); the so-called "three-pointed stones" (also chiefly related to Porto Rico, and probably connected with the cult of the cassava); and the pestles and axe-blades of Jamaica, of which the latter, in qualities of form and polish, challenge comparison with the celts of any other region of the world. In the Greater Antilles gold was collected from the rivers, or by excavation, and worked into ornaments by means of hammering, the process of casting being unknown. Pottery, of rather a rude nature, was made, more particularly by the Tainan, but in no case approximated to the wares of Central America or Peru.

One product, which possessed both an economic and religious significance, was the tobacco-plant, known as *Cohiba* or *Cogioba,* the smoke of which was inhaled through tubes termed *Tabaco.* The name of the tube became transferred to the plant, and has survived in modern civilization. The inhalation of tobacco-smoke was practised at important ceremonies, and eventually reduced the officiating priest to a state of coma, during which he experienced visions which were regarded as divine revelations.

(T. A. J.)

HISTORY

The archipelago received the name of the West Indies from Columbus, who hoped that, through the islands, he had found a new route to India. The name of Antilles was derived from the fact that Columbus, on his arrival here, was supposed to have reached the fabled land of Antilia. Columbus first landed on San Salvador, generally identified with Watling island of the Bahamas, and several voyages to this new land were made in rapid succession by the great discoverer, resulting in the finding of most of the larger islands, and a more intimate knowledge of those already known. The importance of its latest possession was at once recognized by the court of Spain, and, by 1540, Spanish settlements had been made on all of the larger islands and upon many of the smaller ones. The natives were promptly reduced to a state of serfdom or virtual slavery, being distributed, with the lands upon which they lived, among the *conquistadores,* in the form of *encomiendas* or *repartamientos,* institutions which were designed to bring the Indians into subjection to Spanish authority, to provide them with the instruction necessary for becoming Christians, and to furnish the Spanish settlers in these tropical islands a labour supply for the fields and mines. The system resulted in great oppression and brought about the decimation of the native population. The small remnant that survived mingled with the Spanish population to such an extent that few individuals of pure Indian blood could be found on the principal islands.

Spain was not long allowed to retain an undisputed hold upon the West Indies. British, Dutch, French and Danish seamen, coming down the path of the trade winds in their sailing vessels and thus touching at the islands as the first outposts of the New World, soon asserted their claims to parts of this region whose fabled wealth had stirred all Europe and a persistent warfare began to be waged for its possession, in consequence of which the Spaniards found themselves gradually but surely forced from many of their vantage grounds.

In 1625 the British began their colonization of the West Indies by establishing a settlement upon the diminutive island of St. Christopher (St. Kitts) 23 m. long by 5 broad. This was quickly followed by other settlements on St. Eustatius, Barbados, Tobago and St. Croix (all in the same year, 1625), and upon Nevis (1628), Antigua and Montserrat (1632). Other English settlements were made within the next few decades and by 1713 Britain had such a firm hold in the West Indies that the Treaty of Utrecht recognized her claims to the Bahamas, Jamaica, the Caymans, the Caicos and Turks, as well as to most of the islands upon which the settlements above listed had been made and to some others of lesser importance. The first care of the English was to find out the agricultural possibilities of the islands, and they diligently set about planting tobacco, cotton and indigo. About 1650 sugar-cane came to be systematically planted, and it is from this crop that the greatest prosperity of the West Indies has come. Plantation agriculture has long been the basis of economic, social and political development.

Meanwhile the French also had been attracted to the islands. A French West India company was incorporated in 1625 and a settlement established on the island of St. Christopher, where a small English colony was already engaged in clearing and cultivating the ground. These were driven out by the Spaniards in 1630 but only to return and again assume possession. Another colony was planted by the French beside the English settlement on St. Eustatius, and Grenada was occupied at the same time, both in 1625. Dominica followed in 1632 and Martinique in 1635, while Guadeloupe, St. Bartholomew and St. Martin were settled upon in 1648. The Treaty of Utrecht confirmed France in possession of most of the above islands and in addition, the western half of the island of Haiti (St. Dominique), Désirade, St. Lucia and St. Croix. St. Martin she was to share with the Dutch. Several lesser islands also were included in her domain.

Although the Dutch were slightly later in getting a secure foothold in the West Indies, the treaty of 1713 allowed them to retain St. Eustatius, Saba, a part of St. Martin, and the group of islands (Aruba, Curaçao and Bonaire) along the coast of Tierra Firme (Venezuela). This latter group had long been the stronghold of Dutch contraband trade with the Spanish main, carried on principally from the well-protected lagoon harbour of the Schattegat (St. Ann's bay). The Danes, too, had planted colonies on at least one of the West Indies islands and the Treaty of Utrecht left them in possession of St. Thomas and St. John, to which St. Croix was later added. The Spanish thus had lost nearly all of the smaller islands and their holdings were limited principally to Cuba, Porto Rico and the eastern half of Hispaniola (Haiti). The West Indies had become a region of great political complexity, with nearly all the maritime nations of western Europe represented on the map.

During the 17th century and into the beginning of the 18th, the celebrated buccaneers, French, British and Dutch, infested the Caribbean and neighbouring seas, doing much damage to legitimate trade and causing commerce to be carried on only under armed protection and with much difficulty and danger. In fact, piracy lingered off the coasts down to the early years of the 19th century.

Few important political changes were made in the West Indies after the Treaty of 1713 until the period of the wars for independence in America, when both the Spanish and the French parts of the island of Haiti were able to break away from the mother countries and establish the new nations of Haiti and the Dominican Republic, 1804 and 1844 respectively. The next great change in the political map was made in 1898 when the Spanish-American War brought independence to Cuba and the acquisition of Porto Rico by the United States. In 1917 the Danish West Indies also passed into possession of the United States by purchase, Denmark receiving $25,000,000 for her three islands of St. Thomas, St. John and St. Croix, which are now known as the Virgin islands of the United States.

One of the most important developments in the history of the West Indies was the abolition of slavery. In the French, British,

Dutch and Danish islands the negro and mulatto element had become so numerous that it was no longer possible to hold them in bondage. Long continued agitation and repeated revolts, particularly in the French colony of Haiti, where the white population was nearly exterminated, made it necessary to remedy the evil. In 1838 the British freed all the slaves in their West Indies possessions, the French and Danes following ten years later. The reform came more slowly in the Dutch and Spanish colonies, and it was not until 1873 that the former freed all their slaves, while in the Spanish islands of Cuba and Porto Rico slavery continued until 1886. Emancipation, while marking an important advance in human liberty, brought serious consequences in its train. The freed men have been unable to maintain the economic prosperity of former times, while, wherever they are not under the direct control of foreign government, political and social conditions leave much to be desired.

Since the opening of the Panama Canal the West Indies have acquired increased importance, due to their strategic location athwart the ocean highway leading to that interoceanic communication. This has not added greatly to the economic value of the islands but has made their numerous excellent harbours rank high as naval bases. Cuba has granted to the United States the use of two of her strategically situated bays, Guantánamo and Bahía Honda, the latter covering the Straits of Florida, and the former guarding the Windward passage into the Caribbean between Cuba and the island of Haiti. On Porto Rico the harbour of San Juan serves the same purpose, guarding the gateways to the east and the west of this island, while the spacious, nearly land-locked harbour of St. Thomas in the Virgin islands of the United States guards the Virgin passage,—the principal feature that led the United States to desire this group of small islands, and to secure them from Denmark at a fabulous price. Jamaica, Barbados and St. Lucia play somewhat the same part among the British holdings in the West Indies, constituting a series of fortified points that place Great Britain in a strong position in the Caribbean.

(G. M. McB.)

WESTINGHOUSE, GEORGE (1846–1914), American inventor and manufacturer, was born at Central Bridge (N.Y.), on Oct. 6, 1846. He entered the Union Army in the Civil War in 1863, but in 1864 was appointed third assistant engineer in the navy. In 1865 he invented a device for replacing derailed cars and also a reversible steel railway frog. In 1869 he patented his air-brake and organized the Westinghouse Air Brake company. In 1872 he invented the automatic air-brake. This brake was quickly adopted by railways in America and gradually in Europe. He also developed a system of railway signals, operated by compressed air with the assistance of electrical contrivances. In June 1912 he received the Edison Gold Medal for "meritorious achievement in connection with the development of the alternating current system for light and power." In 1893 this system was installed at the Chicago exposition. He built dynamos for the power plants at Niagara Falls, for the rapid transit systems of New York city, and for the London Metropolitan Railway. Westinghouse also devised a method for conveying gas through long-distance pipes, thus making it a practicable fuel. He died in New York on March 12, 1914.

WESTINGHOUSE ELECTRIC AND MANUFACTURING COMPANY, situated at East Pittsburgh, Pa., U.S.A., was founded by George Westinghouse (*q.v.*). In 1882, Westinghouse began the manufacture of direct-current electric lighting generators. After a study of alternating current development and the purchase of many patent rights, George Westinghouse set up, with the assistance of William Stanley, a system which is the basis of present-day alternating-current generation and distribution. The first commercial alternating-current lighting plant was installed in Buffalo, N.Y., in 1886.

Later developments have been the alternating-current system; the induction (Tesla) motor; the rotary converter; the single-reduction-gear street-railway motor; the electro-pneumatic system of multiple-unit train control; the alternating-current system of railway electrification, as exemplified by many American railroads; the single-double-flow turbine; the turbo-generator; the floating-frame reduction gear for turbine-driven ships; and contributions to the art of radio broadcasting. For the year ending March 31, 1927, the sales were $185,543,087 and the number of employees was about 40,000. The outstanding capital stock was $118,503,250. The company is now reorganized as the Westinghouse Electric International Company. (E. M. He.)

WEST LOTHIAN or **LINLITHGOWSHIRE,** south-eastern county, Scotland, has an area of 76,861 ac. (excluding water). The surface rises gradually from the Firth to a hilly district in the south, with summits up to 1,000 feet.

History.—Traces of the prehistoric inhabitants still exist. Stone cists have been discovered at Carlowrie, Dalmeny, Newliston and elsewhere; on Cairnnaple is a circular structure of remote but unknown date; and at Kipps is a cromlech that was once surrounded by stones. The wall of Antoninus lies for several miles in the shire, and Roman camps can be distinguished. The historical associations mainly cluster round Linlithgow (*q.v.*)

Agriculture and Industry.—About three-fourths of the county, the agriculture of which is highly developed, is under cultivation. The best land is found along the coast, as at Carriden and Dalmeny. The farming is mostly arable, permanent pasture being practically stationary (at about 23,000 ac.). Dairy farming provides fresh butter and milk for Edinburgh.

There are large shale oil works at numerous places, and important ironworks; coal is also largely mined, and steel is made at Armadale. Fire-clay is extensively worked. Old silver mines near Bathgate have been reopened recently. Limestone, freestone and whinstone are all quarried. Paper is made at Linlithgow and Bathgate, and distilling carried on at Linlithgow and Bo'ness. Bo'ness is the principal port.

Communications.—The L.N.E. Railway company's line from Edinburgh to Glasgow controls the approaches to the Forth bridge. The Union canal (31 m. long), connecting Edinburgh with the Forth and Clyde canal, crosses the county.

Population and Administration.—In 1921 the population was 83,962; 224 persons spoke Gaelic and English. The chief towns, with populations in 1921, are Bathgate (8,504), Borrowstounness or Bo'ness (10,162), Broxburn (4,777), Linlithgow (3,880), and Armadale (4,927). The shire returns one member to parliament, and is part of the sheriffdom of the Lothians, Selkirk and Peebles, with a resident sheriff-substitute at Linlithgow. The county is under school-board jurisdiction, and there are academies at Linlithgow, Bathgate and Bo'ness.

WESTMACOTT, SIR RICHARD (1775–1856), British sculptor, was born in London in 1775. As a boy he worked in the studio of his father, a sculptor of some reputation. In 1793 he went to Rome and became a pupil of Canova, then at the height

of his fame. Hence, his real sympathies were with pagan rather than with Christian art. In 1805 he was elected an associate, and in 1811 a full member of the Royal Academy, London. In 1827 he succeeded Flaxman as Royal Academy professor of sculpture. Westmacott is best represented by his pedimental figures over the portico of the British Museum, completed in 1847, and his colossal nude statue of Achilles in bronze, copied from the original on Monte Cavallo in Rome and set up in 1822 by the ladies of England in Hyde Park as a compliment to the duke of Wellington. He died on Sept. 1, 1856.

WESTMEATH, a county of Ireland in the province of Leinster. The area is about 709 sq. miles. Pop. (1926) 56,796. Westmeath is a county of carboniferous limestone.

The only heights are Knocklayde (795 ft.), Hill of Ben (710 ft.) and Knockayon (707 feet). A considerable system of eskers, notably north of Tullamore, diversifies the surface of the limestone plain. A large surface is occupied by bog. The loughs of the county have a combined area of nearly 17,000 acres. In the north, on the borders of Cavan, is Lough Sheelin, with a length of 5 m., and an average breadth of between 2 and 3 m., and adjoining it is the smaller Lough Kinale. In the centre of the county is Lough Derravaragh, 6 m. long by 3 m. broad at its widest part. To the north of it are Loughs Lene, Glore, Bawn and others; and to the south, Loughs Iron and Owel. Farther south is Lough Ennell or Belvidere, and in the south-west Lough Ree, a great expansion of the river Shannon, forming part of the boundary with Roscommon. The loughs are noted for their trout.

Westmeath was severed from Meath (*q.v.*) in 1543. The insurrection of 1641 was concerted at Multifarnham abbey, and both in the wars of this period and those of 1688 the majority of the estates in the county were confiscated. There are a considerable number of raths or encampments: one at Rathconrath is of great extent; another at Ballymore was fortified during the wars of the Cromwellian period and those of 1688 and was afterwards the headquarters of Gen. Ginkell, when preparing to besiege Athlone; and there is a third near Lough Lene.

The soil is generally a deep rich loam well adapted both for tillage and pasturage. The occupations are almost wholly agricultural, dairy farming predominating. Flour and meal are largely produced. The only textile manufactures are those of friezes, flannels and coarse linens for home use. The county would benefit from the proposed extension of the Shannon electricity scheme to Lough Ree. Water communication with Dublin is furnished by the Royal canal. The counties of Longford and Westmeath return five members to Dáil Eireann.

WESTMINSTER, MARQUESSES AND DUKES OF. The title of marquess of Westminster was bestowed in 1831 upon Robert Grosvenor, 2nd Earl Grosvenor (1767–1845), whose grandson, Hugh Lupus Grosvenor (1825–1899), was created duke of Westminster in 1874. The family of Grosvenor is of great antiquity in Cheshire. The ancestors of the dukes of Westminster, the Grosvenors of Eaton, near Chester, were cadets of the knightly house of Le Grosvenur. Their baronetcy dates from 1622.

Sir Thomas Grosvenor, the 3rd baronet (1656–1700), in 1676 married Mary (d. 1730), heiress of Alexander Davies (d. 1665), a scrivener, who brought to the Grosvenor family certain lands now covered by some of the most fashionable quarters of the West End. His grandson, Sir Richard Grosvenor (1731–1802), was created Baron Grosvenor in 1761 and Viscount Belgrave and Earl Grosvenor in 1784. The 1st earl, a great breeder of racehorses, was succeeded by his only surviving son Robert, 2nd earl (1767–1845), who rebuilt Eaton Hall and developed his London property, which was rapidly increasing in value. In the House of Commons, where he sat from 1788 to 1802, he was a follower of Pitt, who made him a lord of the admiralty and later a commissioner of the board of control, but after 1806 he left the Tories and joined the Whigs. He was created a marquess at the coronation of William IV. in 1831. Hugh Lupus (1825–1899), grandson of the preceding, was created a duke in 1874, and was a member of parliament for Chester (1847–69), and master of the horse under Gladstone (1880–85), but he left the Liberal party over Home Rule for Ireland. He was succeeded by his grandson Hugh Richard Arthur, 2nd duke (b. 1879).

WESTMINSTER, a part of London, England; strictly a city in the administrative county of London, bounded east by "the City," south by the river Thames, west by the boroughs of Chelsea and Kensington, and north by Paddington, St. Marylebone and Holborn. Westminster was formed into a borough by the London Government Act of 1899, and by a royal charter of the 29th of October 1900 it was created a city. The city comprises two parliamentary divisions known as the Abbey and St. George's, each returning one member. Area, 2,502·7 acres. Pop. (1921) 141,578. The City of Westminster, as thus depicted, extends from the western end of Fleet Street to Kensington Gardens, and from Oxford Street to the Thames, which it borders over a distance of 3 m., between Victoria (Chelsea) Bridge and a point below Waterloo Bridge. It thus contains a large number of national and imperial public buildings from the Law Courts in the east to the Imperial Institute in the west, including Buckingham and St. James's palaces and the National Gallery. But the name of Westminster is more generally associated with a more confined area, namely, the quarter which includes the Abbey, the Houses of Parliament, the government and other buildings in Whitehall, the Roman Catholic Cathedral, and the parts immediately adjacent to these.

Westminster Abbey.—The Abbey of St. Peter is the most widely celebrated church in the British empire. The Thames was bordered in early times by a great expanse of fen land from Chelsea and Battersea, while near the point where the Abbey stands was a low island perhaps three-quarters of a mile in circumference, known as Thorney or Bramble islet. Tributary streams from the north formed channels through the marsh, flanking the island north and south, and were once connected by a dyke on the west. These channels belonged to the Tyburn, which flowed from the high ground of Hampstead. There have been stories of a temple of Apollo and of a church founded under "King Lucius"; there is more probability in the statement of Stow that King Sebert founded a church of St. Peter on Thorney Isle, and legend relates the coming of St. Peter himself to hallow his new church. A charter of Offa, king of Mercia (785), deals with the conveyance of certain land to the monastery of St. Peter; and King Edgar restored the church, defining by a charter dated 951 (not certainly genuine) the boundary of Westminster, extending (in modern terms) from the Marble Arch south to the Thames and east to the City boundary, the former river Fleet. Westminster was a Benedictine foundation. In 1050 Edward the Confessor took up the erection of a new church, cruciform, with a central and two western towers. It was consecrated in 1065 before the Confessor died, but building was continued afterwards. In 1245 Henry III. set about the rebuilding of the church east of the nave.

The Church.—The present Abbey is a cruciform structure consisting of nave with aisles, transepts with aisles (but in the south transept the place of the western aisle is occupied by the eastern cloister walk), and choir of polygonal apsidal form, with six chapels (four polygonal) opening north and south of it, and an eastern Lady chapel, known as Henry VII.'s chapel. There are two western towers, but in the centre a low square tower hardly rises above the pitch of the roof. The main entrance in common use is that in the north transept. The chapter-house, cloisters and other conventual buildings and remains lie to the south. The total length of the church (exterior) is 531 ft. and of the transepts 203 ft. in all. The breadth of the nave without the aisles is 38 ft. 7 in. and its height close upon 102 ft. These dimensions are very slightly lessened in the choir. The exterior is finely proportioned, but the building has been much altered. Wren designed the western towers, completed in 1740 after his death, and Sir Gilbert Scott and Pearson rebuilt the north front.

Within, the Abbey is a superb example of the pointed style. The body of the church is remarkably uniform, because, although the building of the new nave was continued with intermissions from the 14th century until Tudor times, the Early English design in the eastern part was carried on. The choir, with its radiating chapels, plainly follows French models. Exquisite ornament is seen in the triforium arcade, and between some of the arches

in the transept are figures, specially finely carved though much mutilated, known as the censing angels. Henry VII.'s chapel replaces an earlier Lady chapel, and is the most remarkable building of its period. It comprises a nave with aisles, and an apsidal eastward end formed of five small radiating chapels. A splendid series of carved oak stalls lines each side of the nave, and above them hang the banners of the Knights of the Bath. The fan-traceried roof, with its carved stone pendants, is exquisite.

The choir stalls in the body of the church are modern. The reredos is by Scott, with mosaic by Salviati.

Ceremonies and Monuments.—From William the Conqueror onward every sovereign has been crowned in the Abbey excepting Edward V. The coronation chairs stand in the Confessor's chapel. That in use dates from the time of Edward I., and contains beneath its seat the stone of Scone, on which the Scottish kings were crowned. It is of Scottish origin, but tradition identifies it with Jacob's pillow at Bethel. Here also are kept the sword and shield of Edward III., still used in the coronation ceremony. The second chair was made for Mary, consort of William III. Subsequent to the Conquest many kings and queens were buried here, from Henry III. to George II. A part of the south transept is famed under the name of the Poets' Corner. The north transept contains many monuments to statesmen, and the abbey is crowded with tombs and memorials of famous British subjects, the custom of burial here being traditionally linked with the presence of the shrine of Edward the Confessor. The burial of "The Unknown Warrior" in the centre of the nave after the World War is a notable commemoration of the sacrifice made by the people in that war. A number of undistinguished persons also have their tombs in the Abbey.

Conventual and Other Buildings.—The monastery was dissolved in 1539, and Westminster was then erected into a bishopric, but only one prelate, Thomas Thurleby, held the office of bishop. In 1553 Mary again appointed an abbot, but Elizabeth reinstated the dean, with twelve prebendaries. Of the conventual buildings, the cloisters are of the 13th and 14th centuries. On the south side of the southern walk remains of a wall of the refectory are seen from without. From the eastern walk a porch gives entry to the chapter house and the chapel of the Pyx. The first is of the time of Henry III., a fine octagonal building, its vaulted roof supported by a slender clustered column of marble. It was largely restored by Scott. There are mural paintings of the 14th and 15th centuries. The chapel or chamber of the Pyx is part of the undercroft of the original dormitory, and is early Norman work of the Confessor's time. It was used as a treasury for the regalia in early times, and here were kept the standard coins of the realm used in the trial of the pyx now carried out at the Mint. The undercroft is divided into compartments by walls; above it is now the chapter library. To the south-east lies the picturesque Little Cloister, with its court and fountain. Near it are slight ruins of the monastic infirmary chapel of St. Catherine. West of the main cloisters are the Deanery, Jerusalem chamber and College Hall, the building surrounding a small court and dating mainly from the 14th century. This was the abbot's house. Its most famous portion is the Jerusalem chamber, believed to be named from the former tapestries on its walls, representing the holy city. The College Hall, adjoining it, is now the dining-hall of Westminster School.

Westminster School.—St. Peter's College, commonly called Westminster School, is one of the ancient public schools of England. A school was maintained by the monks from very early times. Henry VIII. took interest in it, but the school owes its present standing to Queen Elizabeth. The school buildings lie east of the conventual buildings, surrounding Little Dean's Yard, which, like the cloisters, communicates with Dean's Yard. The buildings are modern or largely modernized. The Great Schoolroom is a fine panelled hall. Ashburnham House, containing one of the school houses, the library and many class-rooms, is named from the family for whom it was built, traditionally but not certainly, by Inigo Jones. The finest part remaining is the grand staircase. There are a number of scholars, called King's Scholars, while a number of scholarships and exhibitions are awarded at the older universities. In the College dormitory a Latin play is annually presented, in accordance with ancient custom. The boys have the privilege of acclaiming the sovereign at the coronation in the Abbey. There is a long standing custom of struggling for the possession of a tossed pancake on Shrove Tuesday. The winner of this Pancake Greaze is rewarded by the Dean.

St. Margaret's.—On the north side of the Abbey, close beside it, is the parish church of St. Margaret. It was founded in or soon after the time of the Confessor, but the present building is Perpendicular, of greater beauty within than without. St. Margaret's is officially the church of the House of Commons.

Westminster Palace: Houses of Parliament.—A royal palace existed at Westminster under Canute, but the building spoken of by Fitzstephen as an "incomparable structure furnished with a breastwork and a bastion" is supposed to have been founded by Edward the Confessor and enlarged by William I. The Hall, called Westminster Hall, was built by William Rufus and altered by Richard II. In 1512 the palace suffered greatly from fire, and thereafter ceased to be used as a royal residence. St. Stephen's chapel, originally built by King Stephen, was used from 1547 for the meetings of the House of Commons, which had been held previously in the chapter house of the Abbey; the Lords used another apartment of the palace.

A fire in 1834 destroyed the whole palace save the historic hall and the present buildings were erected on the site 1840–67. The south-western Victoria Tower is 340 feet high. The Clock Tower 329 feet high contains the clock called Big Ben after Sir Benjamin Hall, First Commissioner of Works at the time when the clock was erected. Of the modern rooms, the House of Lords is an ornate chamber, 97 ft. in length; that of the Commons is 70 ft. long.

Westminster Hall.—The original Hall was finished in 1099, during which year it is recorded that King William Rufus held his first court in the Hall. Little remains of Rufus's Hall beyond its walls which have been encased with modern linings. The unsurpassed open timber roof was erected by King Richard II. in 1394, when Richard appointed John Gedeney to supervise the work of repair to the Hall, with power to engage any necessary masons, carpenters and labourers. Hugh Herland, a master carpenter in the service of the king, was appointed controller to Gedeney and it is probably to Hugh Herland that we owe the creation of the magnificent roof. The span of the roof is 67 ft. 6 in. without any intermediate supports, and its construction presented a problem the solving of which had not previously been attempted. The roof was designed with an upper triangulated framed structure consisting of the main collar beam, principal rafters, and queen posts, with a crown post centrally supporting the heavy ridge piece. This upper triangular framed structure was supported on two cantilever structures embodying the lower principal rafter, the hammer post, the hammer beam, the wall post and the curved strut between wall post and hammer beam, the whole roof being tied together by a great curved brace or arch springing from the corbel at the foot of the wall post passing the hammer beam, the hammer post with its crown at the centre of the main collar beam.

Evidence is available of repairs being carried out to the structure and the roof on many occasions, but the most drastic restoration work was undertaken in recent years and was not completed until 1922. This restoration became an urgent necessity owing to the ravages of the "Death-watch beetle" (the *Xestobium Tossellatum*) whose operations during many years had caused the roof to become entirely unsafe. Investigation undertaken by His Majesty's Office of Works revealed an actual danger of a collapse of a portion of the roof. The ends of many of the principal rafters, the purlins and some of the main collar beams were found to be hollowed out to a thin shell by the attacks of the beetle. In the restoration various expedients were tried to destroy the beetle and its eggs, the most satisfactory result being obtained by spraying the affected timbers after they had been thoroughly cleaned with a solution of ortho-para-dichlor-benzene. A system of steel reinforcement was adopted for supporting the roof structure, and this was so placed as to be invisible.

Westminster Hall was the seat of the chief law court of England for centuries and it witnessed the trials of, among others, Wallace, Richard II., Sir Thomas More, Thomas Campion, Charles I., Titus Oates, Warren Hastings and Queen Caroline. It is thus one of the chief centres of English history.

Whitehall.—Northward from Parliament Square a broad, slightly curving thoroughfare leads to Trafalgar Square. This is Whitehall, which replaced the narrow King Street. Here, between the Thames and St. James's Park, formerly stood York House, a residence of the archbishops of York from 1248. Wolsey beautified the mansion and kept high state there, but on his fall Henry VIII. acquired and reconstructed it, employed Holbein in its decoration, and made it his principal residence. Inigo Jones designed a new palace for James I., but only the banqueting hall was completed (1622), and this survived several fires, by one of which (1697) nearly the whole of the rest of the palace was destroyed. The hall, converted into a royal chapel by George I., and now housing the museum of the Royal United Service Institution, the buildings of which adjoin it, is a fine specimen of Palladian architecture, and its ceiling is adorned with allegorical paintings by Rubens.

The principal government offices are situated in Whitehall. On the left, following the northerly direction, are the Boards of Education, Trade, Local Government, etc. The Home, Foreign, Colonial and India Offices occupy the next block. Downing Street, separating these from the Treasury, contains the official residences of the First Lord of the Treasury and the Chancellor of the Exchequer. The Horse Guards was built in 1753 on the site of a guard-house dating from 1631. The portion of the Admiralty facing Whitehall dates from 1726 and is plain and sombre; but there are new buildings on the park side. On the right of Whitehall, besides the banquet hall, are the War Office, and Montagu House. The Cenotaph, erected in memory of those who fell in the World War, stands in Whitehall.

Trafalgar Square is an open space sloping sharply to the north. On the south side, facing the entry of Whitehall, is the Nelson column (1843), 145 ft. in height, a copy in granite from the temple of Mars Ultor in Rome, crowned with a statue of Nelson. Behind the terrace on the north rises the National Gallery (1838), with its splendid collection of paintings. The National Portrait Gallery is on the north-east side of the National Gallery.

Westminster Cathedral.—A short distance from Victoria St. towards its western end, stands Westminster Cathedral (Roman Catholic). Its site is somewhat circumscribed, but it is a remarkable modern building (1896–1905) in early Christian Byzantine style with a stately domed campanile.

WESTMINSTER, STATUTES OF, two English Statutes passed during the reign of Edward I. Parliament having met at Westminster on April 22, 1275, passed the statute of Westminster I. In the words of Stubbs (*Const. Hist.* cap. xiv.):—

"This act is almost a code by itself; it contains 51 clauses, and covers the whole ground of legislation. Its language now recalls that of Canute or Alfred, now anticipates that of our own day; on the one hand common right is to be done to all, as well poor as rich, without respect of persons; on the other, elections are to be free, and no man is by force, malice or menace, to disturb them. The spirit of the Great Charter is not less discernible: excessive amercements, abuses of wardship, irregular demands for feudal aids, are forbidden in the same words or by amending enactments. The inquest system of Henry II., the law of wreck, and the institution of coroners, measures of Richard and his ministers, come under review as well as the Provisions of Oxford and the Statute of Marlborough."

The second statute of Westminster was passed in the parliament of 1285. Like the first statute it is a code in itself, and contains the famous clause *De donis conditionalibus* (*q.v.*), "one of the fundamental institutes of the mediaeval land law of England." Stubbs says of it: "The law of dower, of advowson, of appeal for felonies, is largely amended; the institution of justices of assize is remodelled, and the abuses of manorial jurisdiction repressed; the statute *De religiosis*, the statutes of Merton and Gloucester, are amended and re-enacted. Every clause has a bearing on the growth of the later law."

The statute *Quia Emptores* of 1290 is sometimes called the statute of Westminster III.

WESTMINSTER, SYNODS OF. Under this heading are included certain of the more important councils of the English Church held within the present bounds of London. Though the precise locality is occasionally uncertain, the majority of the mediaeval synods assembled in the chapter-house of old St. Paul's, or the former chapel of St. Catherine within the precincts of Westminster Abbey or at Lambeth. The councils were of various types, each with a constitutional history of its own. Before the reign of Edward I., when convocation assumed substantially its present form (*see* CONVOCATION), there were convened in London various diocesan, provincial, national and legatine synods; during the past six centuries, however, the chief ecclesiastical assemblies held there have been convocations of the province of Canterbury. From the time of Edward VI. on, many of the most vital changes in ecclesiastical discipline were adopted in convocations at St. Paul's and in the Abbey.

BIBLIOGRAPHY.—For acts of synods prior to the Reformation *see* W. Lynwood, *Provinciale* (1679), and best of all Wilkins; for the canons and proceedings of convocations from 1547 to 1717 consult E. Cardwell, *Synodalia* (2 vols., 1842); for translations and summaries, Landon, *Manual of the Councils of the Holy Catholic Church* (1893) and Hefele, *Conciliengeschichte*, vol. iv. ff.; *see* also T. Lathbury, *A History of the Convocation of the Church of England* (2nd enlarged edition, 1853); A. P. Stanley, *Historical Memorials of Westminster Abbey* (4th revised ed., 1876), 411-413, 495-504; H. H. Milman, *Annals of St. Paul's Cathedral* (2nd ed., 1869).

WESTMINSTER BANK LIMITED. British joint stock banking company, one of the "Big Five" of British banking. The London and Westminster Bank, in which it had its beginning, was the pioneer of joint-stock banking in London, and was founded, in the face of strenuous opposition, in 1834. Its inception was the outcome of the persistent efforts of W. R. Douglas and a group of friends, who, dissenting from the popularly held belief that the Bank of England had legally a complete monopoly of joint-stock banking within a radius of 65m. of London, and interpreting the restriction to apply only to banks of issue, resolved to test their case, and applied to parliament for a definition of the Bank of England's powers. The law officers of the Crown upheld the view that the bank's charter did not prevent the formation of joint-stock banks in the London area, provided that they did not issue notes, and the legality of such institutions was affirmed by the Bank Charter Renewal Act of 1833.

On the removal of this legal obstacle, Douglas's committee formed a bank of deposit which they termed the London and Westminster Bank. In March 1834 the bank commenced operations, with a paid-up capital of only £50,000, and with £30,000 in its tills. In 1854, admission to the London Bankers' Clearing House was secured, and the bank became a limited liability company in 1880.

The company absorbed from time to time a number of private and joint-stock banks. In 1909 amalgamation was effected with the London and County Banking Company, which had an important business in London and the home counties. The London County and Westminster Bank (Paris), of which the entire capital was held by the parent bank, was established in 1913, and opened branches in France and Belgium. The affiliation of the Ulster Bank, Ltd., took place in 1917, and other amalgamations followed: with Parr's Bank, Ltd. (1918), with the Nottingham and Notts Banking Company (1919); the Yorkshire banking-houses of Beckett and Company (1919), etc. The bank has built up a strong position as an issuing house, especially in relation to the stocks of British Dominions and Corporations.

The title of the institution was shortened in 1923 to Westminster Bank, Ltd., and at the same time the foreign auxiliary became Westminster Foreign Bank, Ltd. At the beginning of 1928, the bank had 970 offices, of which 189 were in the metropolitan area. Its authorized capital was £33,000,000, of which £30,533,127 had been subscribed, and £9,320,157 paid up. The reserve equalled the paid-up capital. Current, deposit and other accounts totalled £280,612,019. The head office of the bank is in Lothbury, London. (L. C. M.)

WESTMORLAND, EARLS OF. Ralph Neville, 4th Baron Neville of Raby, and 1st earl of Westmorland (1364–1425), eldest son of John, 3rd Baron Neville, and his wife Maud Percy (*see* NEVILLE: *Family*), was knighted by Thomas of Woodstock, afterwards duke of Gloucester, during the French expedition of 1380, and succeeded to his father's barony in 1388.

He was repeatedly engaged in negotiations with the Scots, and his assistance to the court party against the lords appellant was rewarded in 1397 by the earldom of Westmorland. He married as his second wife Joan Beaufort, half-sister of Henry of Lancaster, afterwards Henry IV., whom he joined on his landing in Yorkshire in 1399. He already held the castles of Brancepeth, Raby, Middleham and Sheriff Hutton when he received from Henry IV. the honour and lordship of Richmond for life. The only rivals of the Nevilles in the north were the Percies, whose power was broken at Shrewsbury in 1403; and the wardenship of the west marches was now assigned to Westmorland, whose influence was also paramount in the east, which was under the nominal wardenship of the young Prince John, afterwards duke of Bedford. In May the Percies were in revolt, with Thomas Mowbray, earl marshal, and Archbishop Scrope. Westmorland met them on Shipton Moor, near York, on May 29, 1405, and suggested a parley between the leaders. By pretending accord with the archbishop, the earl induced him to allow his followers to disperse. Scrope and Mowbray were then seized and handed over to Henry at Pontefract on Jan. 3. The improbabilities of this narrative have led some writers to think, in face of contemporary authorities, that Scrope and Mowbray must have surrendered voluntarily. If Westmorland betrayed them he at least had no share in their execution. Thenceforward he was busily engaged in negotiating with the Scots and keeping the peace on the borders. He did not play the part assigned to him by Shakespeare in *Henry V.*, for during Henry's absence he remained in charge of the north, and was a member of Bedford's council. Of his daughters, Catherine married in 1412 John Mowbray, second duke of Norfolk, brother and heir of the earl marshal, who had been executed after Shipton Moor; Anne married Humphrey, first duke of Buckingham; Eleanor married, after the death of her first husband, Richard le Despenser, Henry Percy, 2nd earl of Northumberland; Cicely married Richard, duke of York, and was the mother of Edward IV. and Richard III. The earl died on Oct. 21, 1425, and a fine alabaster tomb was erected to his memory in Staindrop church close by Raby castle.

See J. H. Wylie, *History of England under Henry IV.* (4 vols., 1884–98).

CHARLES, 6th earl (1543–1601), eldest son of Henry, 5th earl, by his first wife Jane, daughter of Thomas Manners, 1st earl of Rutland, was brought up a Roman Catholic, and was further attached to the Catholic party by his marriage with Jane, daughter of Henry Howard, earl of Surrey. He was a member of the council of the north in 1569, when he joined Thomas Percy, 7th earl of Northumberland, and his uncle Christopher Neville, in the Catholic rising of the north, which aimed at the liberation of Mary, queen of Scots. On the collapse of the ill-organized insurrection Westmorland fled with his brother earl over the borders, and eventually to the Spanish Netherlands, where he died on Nov. 16, 1601. He left no sons, and his honours were forfeited by his formal attainder in 1571. Raby castle remained in the hands of the Crown until 1645.

The title was revived in 1624 in favour of Sir Francis Fane (*c.* 1574–1629), whose mother, Mary Neville, was a descendant of a younger son of the first earl. He was created baron of Burghersh and earl of Westmorland in 1624, and became Lord le Despenser on his mother's death in 1626. His son Mildmay Fane, 2nd or 8th earl of Westmorland (*c.* 1602–1666), at first sided with the king's party, but was afterwards reconciled with the parliament. John Fane, 7th or 13th earl of Westmorland (1682?–1762), served with distinction in various campaigns under Marlborough, and was made in 1739 lieutenant-general of the British armies.

JOHN FANE, 11th or 17th earl (1784–1859), only son of John, 10th earl, was known as Lord Burghersh until he succeeded to the earldom in 1841. He entered the army in 1803, and in 1805 took part in the Hanoverian campaign as aide-de-camp to General Sir George Don. He was assistant adjutant-general in Sicily and Egypt (1806–07), served in the Peninsular War (1808–13), was British military commissioner to the allied armies under Schwarzenberg, and marched with the allies to Paris in 1814. He was subsequently promoted major-general (1825), lieutenant-general (1838) and general (1854), although the latter half of his life was given to the diplomatic service. He was British resident at Florence (1814–30), and ambassador at Berlin from 1841 to 1851, when he was transferred to Vienna. He retired in 1855, and died at Apthorpe House, Northamptonshire, on Oct. 16, 1859. He composed several operas, took a keen interest in the cause of music in England, and in 1822 made proposals which led to the foundation in 1823 of the Royal Academy of Music. His wife Priscilla Anne (1793–1879), daughter of William Wellesley-Pole, 3rd earl of Mornington, was a distinguished artist.

His published works include *Memoirs of the Early Campaigns of the Duke of Wellington in Portugal and Spain* (1820), and *Memoir of the Operations of the Allied Armies under Prince Schwarzenberg and Marshal Blücher* (1822). *See* also *Correspondence of Priscilla, Countess of Westmorland, 1812–1870* (1909).

FRANCIS WILLIAM HENRY, 12th or 18th earl (1825–1891), fourth son of the preceding, served through the Punjab campaign of 1846, and at Gujrat on Feb. 21, 1849. He went to the Crimea as aide-de-camp to Lord Raglan.

WESTMORLAND, a north-western county of England. It reaches the sea in the Kent estuary in Morecambe Bay. Area (exclusive of water) 775·7 sq.m. Prof. Marr recognizes three major and three minor physical divisions. The largest, the slate tract, is west of a line from the foot of Ullswater to Ravenstonedale. In this we find Ordovician (Borrowdale volcanic series) and Silurian rocks (*see* LAKE DISTRICT) which form a region of mountains and fells with deep-cut valleys. The chief peaks are Helvellyn (3,118 ft.), Bow Fell (2,960), Fairfield (2,863), Cringle Crags (2,816), Red Screes (2,541), High Street (2,663), High Raise (2,634) and Langdale Pikes (2,401) with the lakes of Ullswater, Haweswater, Grasmere, Rydalwater, Elterwater and Windermere (in part in the county). The second division embraces the New Red Sandstone tract of the upper Eden valley with its base through Penrith reaching to near Kirkby Stephen. Most of the area lies between the 500 and 1,000 ft. contour. To the east is the third major division, that part of the Pennine hills within the county boundary. It is a moorland tract with Milburn Forest (2,780 ft.), Dufton Fell (2,403), Hilton Fell (2,446) and other heights. The high ground (average 1,000 ft.) in the triangle between Kendal and the southern boundary of the county includes Kendal Fell, Farleton Knott and Whitbarrow. The chief rivers are the upper waters of the Eden (with the Lowther and the Eamont), the Tees, the Lune and the Kent.

History and Early Settlement.—Implements of ground or polished stone have been found in Westmorland, some of rather special types such as certain supposed "sinkers," objects shaped like two acorns base to base with a transverse groove between them; they seem not to have been hammers. A group of monuments extends from Little Salkeld near Penrith in Cumberland to near Shap in Westmorland; it includes a circle, near Penrith, called Long Meg and her daughters, 68 stones with "Long Meg" extra, standing apart, another called Mayborough, another (an earthwork) called King Arthur's Round Table, all in Cumberland. At Gunnerheld (near Shap) is a double circle. A barrow at Crosby Garrett is of special importance. Canon Grenwell considered that the Romans probably found a considerable indigenous population, necessitating defence on their part, and their roads and camps are a feature especially east of the Eden.

The earliest English settlements were by Anglian tribes, in the 6th century in the neighbourhood of Kendal. The northern district remained unconquered, until the close of the 7th century when Ecgfrith drove out the Britons and established the Northumbrian supremacy over the district. The Danes arrived in the 9th century and the Norsemen in the 10th. Westmorland is mentioned in the Saxon Chronicle in 966. At the time of the Domesday Survey the barony of Kendal belonged to the crown. The

annexation of the northern portion of Westmorland to the crown was accomplished by William Rufus, in 1092. Westmorland was established as an administrative county by Henry I. in 1131, by the separation of the northern part from the land of Carlisle.

The division of Westmorland into wards originated with the system of defence against the Scots, each barony being divided into two wards, and each ward placed under a high constable. From early times the political history of Westmorland is a record of continuous inroads and devastations from the Scots. Appleby was frequently raided and in 1388 it was sacked and almost completely ruined. In the Wars of the Roses, Westmorland favoured the Lancastrians and in the Civil War of the 17th century the chief families were Royalists. Appleby Castle surrendered in 1648, but the Royalist feeling was shown in the joy which greeted the news of the Restoration. The Jacobite rising of 1745 found many adherents in Westmorland, and a skirmish took place on Clifton Moor.

There are very few notable ecclesiastical buildings, though the ruins of Shap Abbey, near the market town of that name should be remarked. The Perpendicular western tower and other fragments remain. Late Norman work is preserved in some of the churches, as at Kirkby Lonsdale, and in a few castles. Among the castles are Appleby, Brough, Brougham and Kendal. In the Kendal district are the houses, Levens Hall dating from the 16th century, and Sizergh Hall embodying part of an ancient castle. The formal gardens at Levens Hall are remarkable. Lowther Castle, near Penrith, is a fine modern mansion.

The economic development of Westmorland has been slow and unimportant, the rugged nature of the ground being unfavourable to agricultural prosperity, while the lack of fuel hindered the growth of manufactures. Sheep-farming was carried on in the moorland districts, however, and the Premonstratensian house at Shap exported wool to Florentine and Flemish markets in the 13th and 14th centuries. Kendal was a centre of the clothing industry in the 14th century. In 1589 the county suffered severely from the plague.

Climate and Agriculture.—The county may be considered to lie within an area having 40 to 60 in. mean annual fall. The summer temperature is mild. The helm-wind (*q.v.*) is characteristic of this district. Less than one-half of the total area is under cultivation, and of this 61% is in permanent pasture, both cattle and sheep being largely kept. The fell land furnishes nourishment for the hardier breeds of sheep. The sale of these, stock cattle, horses and pigs, and dairy produce is the staple of the farmers' income. A large part of Westmorland was formerly in the hands of "statesmen" (*see* CUMBERLAND) whose holdings were usually small. The proportion of landowners of this class has greatly decreased.

Manufactures and Communications.—Woollen manufacture, chiefly confined to Kendal, is the chief industry. Bobbin making, paper making, the manufacture of explosives and several small industries are carried on, and use the water-power and hydro-electric power available at points. Granite, roofing slate, marble, graphite and a little coal, iron, lead and barytes are obtained.

The main lines of the L.M.S.R. traverse the county, ascending heavy gradients, of which the most severe crosses Shap Fells. The railways connect, east and west, by means of branches.

Population and Administration.—The population in 1901 was 64,303; in 1921, 65,746. It is the only county in England which has a density of population of less than 100 per sq.m. The general character of the dialects of Westmorland is that of a basis of Anglian speech, influenced to a certain extent by the speech current amongst the pre-Anglian peoples of Strathclyde. The people show a well-marked Scandinavian influence. Three distinct dialects can be made out.

The municipal boroughs are Appleby, the county town (pop. 1,785) and Kendal (14,146). The urban districts are Ambleside (2,876), Bowness and Windermere (6,495), Grasmere (1,173), Kirkby Lonsdale (1,393) and Shap (1,005). The county is in the northern circuit, and the assizes are held at Appleby. It has one court of quarter sessions and is divided into six petty sessional divisions. Kendal has a separate commission of the peace. Westmorland is in the diocese of Carlisle. The county returns one member to parliament.

Sedgefield, *The Place-names of Cumberland and Westmorland* (1915); D. Scott, *Cumberland and Westmorland* (1920).

WEST NEW YORK, a town of New Jersey, U.S.A., on the Hudson river. Pop. (1920) 29,926 (30% foreign-born white); 1928 local estimate 45,000. The town had 161 factories in 1925, producing goods valued at $16,921,073. It was incorporated in 1898.

WESTON, a city of West Virginia, U.S.A., the county seat of Lewis county. Pop. 5,701 in 1920 (92% native white); estimated locally at 9,000 in 1928. The city lies 1,025 ft. above sea-level, in a rich blue-grass region, containing immense coal deposits, oil and gas wells and great stands of poplar and oak. It is the headquarters of nine lumber companies, and has various manufacturing plants. The town was incorporated in 1818, and was chartered as a city in 1847.

WESTON-SUPER-MARE, a seaside resort of Somersetshire, England, on the Bristol channel, 137½ m. W. by S. of London by the G.W.R. It is served also by the Weston, Clevedon & Portishead Railway. Pop. of urban district (1921) 31,643. It is sheltered from the north and east by Worlebury hill. Intermittent springs exist, which are affected by the ebb and flow of the tide.

WEST ORANGE, a town of Essex county, New Jersey. Pop. (1920) 15,573 (22% foreign-born white). In Llewellyn Park is the home of Thomas A. Edison, who has had his laboratories in West Orange since 1887.

WESTPHALIA (Ger. *Westfalen*), a province of Prussia. The area of the province is 7,806 sq.m., its length both from north to south and from east to west is about 130 miles.

Nearly half of Westphalia is an extension of the great North-German plain, which is broken by outcrops of the underlying Cretaceous beds, and is not very fertile, except in the Hellweg, a zone between the Haarstrang and the Lippe. There are extensive fens in the north and west, and north of Paderborn is a sandy waste called the Senne. The plain is drained in the north by the Ems and in the south by the Lippe, which rise close together in the Teutoburger Wald. Between their basins are the Vechte and other small rivers flowing into the Zuyder Zee. The triangular southern portion of Westphalia, most of which is included in Sauerland ("south land"), is a rugged region of slate hills and wooded valleys drained chiefly by the Ruhr with its affluents the Lenne, Möhne, etc., and in the south by the Sieg and Eder. The hills rise in the south-east to the Rotlager or Rothaargebirge, culminating in the Winterberg plateau with the Kahler Asten (2,713 ft.), the highest summit in the province. The Rotlagergebirge, Eggegebirge and Teutoburger Wald form the watershed between the Weser and the Rhine and Ems. The Weser divides the Wiehengebirge from the Wesergebirge by the narrow pass called *Porta Westfalica.*

The climate is temperate except in the south, which is cold in winter and has a heavy rainfall. The crops include grain of all kinds, peas and beans, buckwheat, potatoes, fruit and hemp. The cultivation of flax is very extensive, especially in the north-east. Swine, which are reared in great numbers in the plains, yield the famous Westphalian hams; horse-breeding and the rearing of cattle and goats are also important.

The mineral wealth is very great, especially in coal and iron. The production of coal is greater than that of any other province of Prussia. The great Ruhr coal-field extends from the Rhineland into the province as far as Unna, the centre being Dortmund, and there is a smaller coal-field in the north at Ibbenbüren. The production of iron ore, chiefly south of the Ruhr, is exceeded in Prussia only by that of the Rhine province. After coal and iron the most valuable minerals are zinc, lead, pyrites and copper. Antimony, quicksilver, stone, marble, slate and potter's clay are also worked, and there are brine springs in the Hellweg and mineral springs at Lippspringe, Öynhausen, etc.

The manufacturing industry of the province, which chiefly depends upon its mineral wealth, is very extensive. Iron and steel

goods are produced in the so-called "Enneper Strasse," the valley of the Ennepe, a small tributary of the Ruhr with the town of Hagen, and in the neighbouring towns of Bochum, Dortmund, Iserlohn and Altena, and also in the Siegen district. The brass and bronze industries are carried on at Iserlohn and Altena, those of tin and Britannia metal at Lüdenscheid; needles are made at Iserlohn and wire at Altena. The very important linen industry of Bielefeld, Herford, Minden and Warendorf has flourished in this region since the 14th century. Jute is manufactured at Bielefeld and cotton goods in the west. Paper is extensively made on the lower Lenne, and leather around Siegen. Other manufactures are glass, chemicals, sugar, sausages and cigars. An active trade is promoted by several trunk lines of railway which cross the province and by the navigation of the Weser (on which Minden has a port), Ems, Ruhr and Lippe. Beverungen is the chief market for corn and Paderborn for wool.

The population in 1925 was 4,806,713, or about 616 per sq.m. It is very unevenly distributed, and in the industrial districts has been increasing very rapidly; it includes a considerable element of Polish workpeople. As at the peace of Westphalia, the bishoprics of Münster and Paderborn and the former duchy of Westphalia are Roman Catholic, while the secularized bishopric of Minden and the former counties of Ravensberg and Mark (former possessions of Brandenburg) and Siegen (Nassau) are predominantly Protestant.

The province is divided into the three governmental departments (*Regierungsbezirke*) of Minden, Münster and Arnsberg. Münster is the seat of government and of the provincial university.

The inhabitants are mainly of the Saxon stock and speak Low German dialects, except in the Upper Frankish district around Siegen, where the Hessian dialect is spoken.

History.—Westphalia, "the western plain" (in early records *Westfalani*), was originally the name of the western province of the early duchy of Saxony, including the western portion of the modern province and extending north to the borders of Friesland. When Duke Henry the Lion of Saxony fell under the ban of the empire in 1180, and his duchy was divided, the archbishop of Cologne, Philip of Heinsberg, received from the emperor Frederick I. the Sauerland and some other districts which became the duchy of Westphalia. The duchy received a constitution of its own, and was governed for the archbishop, afterwards elector, by a marshal (*Landmarschall*, after 1480 *Landdrost*), who was also stadtholder, and presided over the Westphalian chancellery. This system lasted till 1803. By the settlement of 1803 the Church lands were secularized, and Prussia received the bishopric of Paderborn and the eastern part of Münster, while the electoral duchy of Westphalia was given to Hesse-Darmstadt.

After the peace of Tilsit, the kingdom of Westphalia was created by Napoleon I. on Aug. 18, 1807, and given to his brother Jerome (*see* BONAPARTE). It included the present governmental department of Minden, but by far the larger part of the kingdom lay outside and chiefly to the east of the modern province, and comprised the Hanoverian department of Hildesheim and in part that of Arensberg, Brunswick, the northern part of the province of Saxony as far as the Elbe, Halle, and most of Hesse-Cassel. The area was 14,627sq.m., and the population nearly two millions. Cassel was the capital. A constitution on the French imperial pattern granted by the king remained practically inoperative, an arbitrary bureaucratic régime was instituted, the finances were from the beginning in a hopeless condition, and the country was drained of men and money for Napoleon's wars. In Jan. 1810 most of Hanover was added, but at the end of the same year half the latter, together with the city of Minden, was annexed to the French empire. At the congress of Vienna (1815) Hesse-Darmstadt surrendered her share of Westphalia to Prussia, and the present province was constituted.

WESTPHALIA, TREATY OF, the name given to two treaties concluded on Oct. 24, 1648, by the Holy Roman Empire with France at Münster and with Sweden and the Protestant estates of the Empire at Osnabrück, by which the Thirty Years' War (*q.v.*) was brought to an end.

As early as 1636 negotiations had been opened at Cologne at the instance of Pope Urban VIII., supported by the seigniory of Venice, but failed owing to the disinclination of Richelieu to stop the progress of the French arms, and to the refusal of Sweden to treat with the papal legate. In 1637 the agents of the emperor began to negotiate at Hamburg with Sweden, though the mediation of Christian IV., king of Denmark, was rejected by Sweden, and the discussions dragged on for years without result. In the meantime the new emperor Ferdinand III. proposed at the diet of Regensburg in 1640 to extend the peace of Prague to the whole empire, on the basis of an amnesty, from which, however, those Protestant estates[1] who were still leagued with foreign powers were to be excluded. His aim was by settling the internal affairs of the empire to exclude the German princes from participation in negotiations with foreign powers; these efforts failed.

The Comte d'Avaux, French envoy at Hamburg, proposed in 1641 that negotiations should be transferred to Münster and Osnabrück. A preliminary treaty embodying this proposal was concluded between the representatives of the emperor, France, and Sweden at Hamburg on Dec. 25, 1641. The two assemblies were to be regarded as a single congress, and neither should conclude peace without the other. The date fixed for the meeting was July 11, 1643, but many months elapsed before all the representatives arrived, and the settlement of many questions of precedence and etiquette caused further delays. England, Poland, Muscovy, and Turkey were the only European powers unrepresented. The war continued during the deliberations.

The chief representative of the emperor was Count Maximilian von Trautmansdorff, to whose sagacity the conclusion of peace was largely due. The French envoys were nominally under Henry of Orleans, duke of Longueville, but the marquis de Sablé and the comte d'Avaux were the real agents of France. Sweden was represented by John Oxenstierna, son of the chancellor, and by John Adler Salvius, who had previously acted for Sweden at Hamburg. The papal nuncio was Fabio Chigi, afterwards Pope Alexander VII. Brandenburg, represented by Count Johann von Sayn-Wittgenstein, played the foremost part among the Protestant states of the empire. On June 1, 1645, France and Sweden brought forward propositions of peace, which were discussed by the estates of the empire from Oct. 1645 to April 1646. The settlement of religious matters was effected between Feb. 1646 and March 1648. The treaty was signed at Münster by the members of both conventions on Oct. 24, 1648, and ratifications were exchanged on Feb. 8, 1649. The papal protest of Jan. 3, 1651, was disregarded.

Sweden received western Pomerania with Rügen and the mouths of the Oder, Wismar and Poel in Mecklenburg, and the lands of the archbishopric of Bremen and the bishopric of Verden, together with an indemnity of 5,000,000 thalers. The privileges of the Free Towns were preserved. Sweden thus obtained control of the Baltic and a footing on the North Sea, and became an estate of the empire with three deliberative voices in the diet.

The elector of Brandenburg received the greater part of eastern Pomerania, and, as he had a claim on the whole duchy since the death of the last duke in 1635, he was indemnified by the bishoprics of Halberstadt, Minden, and Kammin, and the reversion of the archbishopric of Magdeburg, which came to him on the death of the administrator, Prince Augustus of Saxony, in 1680. The elector of Saxony was allowed to retain Lusatia. As compensation for Wismar, Mecklenburg-Schwerin obtained the bishoprics of Schwerin and Ratzeburg and some lands of the Knights of St.

[1] *i.e. Reichsstände*, princes, nobles, and cities holding immediately of the emperor.

John. Brunswick-Lüneburg restored Hildesheim to the elector of Cologne, and gave Minden to Brandenburg, but obtained the alternate succession to the bishopric of Osnabrück and the church lands of Walkenried and Gröningen. Hesse-Cassel received the prince-abbacy of Hersfeld, the county of Schaumburg, etc. The elector of Bavaria was confirmed in his possession of the Upper Palatinate, and in his position as an elector which he had obtained in 1623. Charles Louis, the son and heir of Frederick V., the count palatine of the Rhine, who had been placed under the ban of the Empire, received back the Lower Palatinate, and a new electorate, the eighth, was created for him.

France obtained the recognition of the sovereignty (which she had enjoyed *de facto* since 1552) over the bishoprics and cities of Metz, Toul, and Verdun, Pinerolo in Piedmont, the town of Breisach, the landgraviate of Upper and Lower Alsace, the Sundgau, the advocacy (*Landvogtei*) of the ten imperial cities in Alsace, and the right to garrison Philippsburg. During the Thirty Years' War France had professed to be fighting against the house of Austria, and not against the empire. It was stipulated that the immediate fiefs of the Empire in Alsace should remain in enjoyment of their liberties, but it was added as a condition that the sovereignty of France in the territories ceded to her should not be impaired. The intention of France was to acquire the full rights of Austria in Alsace, but as Austria had never owned the landgraviate of Lower Alsace, and the *Landvogtei* of the ten free cities did not in itself imply possession, the door was left open for disputes. Louis XIV. afterwards availed himself of this ambiguous clause in support of his aggressive policy on the Rhine. The independence of Switzerland was at last formally recognized, as was that of the United Netherlands in a separate treaty.

Apart from these territorial changes, a universal and unconditional amnesty to all those who had been deprived of their possessions was declared, and it was decreed that all secular lands should be restored to those who had held them in 1618. Some exceptions were made in the case of the hereditary dominions of the emperor.

Even more important than the territorial redistribution was the ecclesiastical settlement. By the confirmation of the treaty of Passau of 1552 and the religious peace of Augsburg of 1555, and the extension of their provisions to the Reformed (Calvinist) Church, toleration was secured for the three great religious communities of the empire. Within these limits the governments were bound to allow at least private worship, liberty of conscience, and the right of emigration, but these measures of toleration were not extended to the hereditary lands of the house of Habsburg. The Protestant minority in the imperial diet was not to be coerced by the majority, but religious questions were to be decided by amicable agreement. Protestant administrators of church lands obtained seats in the diet. Religious parity was established in the imperial chamber (*Reichskammergericht*), and in the imperial deputations and commissions.

The difficult question of the ownership of spiritual lands was decided by a compromise. The edict of restitution of 1629 was annulled. By the important provision that a prince should forfeit his lands if he changed his religion an obstacle was placed in the way of a further spread of the Reformation. The declaration that all protests or vetoes by whomsoever pronounced should be null and void dealt a blow at the intervention of the Roman curia in German affairs.

The constitutional changes made by the treaty had far-reaching effects. The territorial sovereignty of the states of the empire was recognized. They were empowered to contract treaties with one another and with foreign powers, provided that the emperor and the empire suffered no prejudice. By this and other changes the princes of the empire became absolute sovereigns in their own dominions. The emperor and the diet were left with a mere shadow of their former power. The emperor could not pronounce the ban of the empire without the consent of the diet. The diet, in which the 61 imperial cities gained the right of voting on all imperial business, and thus were put on an equality with the princes, retained its legislative and fiscal powers in name, but practically lost them by the requirement of unanimity among the three colleges.

Not only was the central authority replaced almost entirely by the sovereignty of about 300 princes, but the power of the empire was materially weakened in other ways. It lost about 40,000sq.m. of territory, and obtained a frontier against France which was incapable of defence. Sweden and France as guarantors of the peace acquired the right of interference in the affairs of the empire, and the former gained a voice in its councils. For many years Germany thus became the principal theatre of European diplomacy and war. But if the treaty of Westphalia pronounced the dissolution of the old order in the empire, it facilitated the growth of new powers in its component parts, especially Austria, Bavaria, and Brandenburg.

The treaty was recognized as a fundamental law of the German constitution, and formed the basis of all subsequent treaties until the dissolution of the Empire.

WEST POINT, a national military post on a 3,500 ac. reservation on the west bank of the Hudson river in Orange county, N.Y., U.S.A., 50 m. N. of New York city. The West Shore railway, the Hudson River Day Line and the Storm King highway all serve West Point.

The United States Military Academy, located at West Point, trains young men for commissions in the military service. By law, the supervision of the Military academy is vested in the War Department. Candidates for admission must be unmarried and between 17 and 22. The course is four years. The academic year extends from Sept. 1 to June 4; the remainder of the year is devoted to military training in summer camp at West Point. The annual pay of a cadet is $1,072, which is sufficient to meet his actual needs. Upon graduation a cadet may be commissioned a second lieutenant in the regular army.

The authorized strength (1928) of the corps of cadets is 1,374. By the acts of Congress approved on May 4, 1916 and June 8, 1926, cadets may be appointed from the following sources: four from each State at large, two from each congressional district, two from each Territory, four from the District of Columbia, two natives of Porto Rico, 122 from the United States at large and 180 from among the enlisted men of the regular army and National Guard. Four Filipinos are also authorized, but they may be commissioned only in the Philippine scouts.

There are two methods of meeting the educational requirements for admission to the Military academy: By passing an entrance examination or by submitting a satisfactory educational certificate from an institution accredited by the Military academy. Physically, the candidate must be at least 5 ft. 4 in. tall, of sound body and free from any disorder of an infectious or immoral character. Upon admission each cadet takes an oath of allegiance to his country and agrees to serve in the U.S. army for eight years unless sooner released by proper authority.

The basis of military training at West Point is discipline. Cadets are taught absolute and unquestioned obedience. The training is progressive, from the simplest duties of the soldier to the command of small combat units under simulated war conditions. Elementary training in all branches of the service is given to all men, but no arm of the service is emphasized. The military training aims to develop leadership. With the exception of drills after classes in autumn and spring months, and the study of minor tactics during the school year, no other military work is given during the academic year. The summer is devoted entirely to military training; then the first, or senior class, goes to Ft. Monroe, Va., where it fires fixed and mobile long-range guns. Nearby, at Ft. Eustis, these cadets fire light artillery and at Langley field they study aeronautics and actually pilot planes.

The West Point system of training aims to balance the development of body, mind and character. Athletic teams represent the academy in competition with other colleges in football, basketball, baseball, track, lacrosse, cross-country running, hockey, tennis, golf, swimming, boxing, wrestling, fencing, rifle and pistol shooting, soccer and polo. Eighty per cent of the upper classmen are members of some corps team.

All cadets take the same technical course, which is rigorously thorough rather than extremely difficult. Mathematics is stressed more than any other subject. The other subjects covered are English, French, surveying, tactics, drawing, history, chemistry, natural and experimental philosophy, Spanish, engineering, ordnance and gunnery, economics, government, hygiene, military art and military law.

With the majestic Hudson on one side and graceful mountain ranges in the background, the site of the Military academy is one of the most beautiful spots to be found anywhere. The Gothic buildings of native grey stone seem to be a part of their natural surroundings. The riding hall is one of the largest in the world. The library, built in 1841, contained 120,000 vols. in 1928 and many rare manuscripts, maps and trophies. Here are some original paintings by Stuart and Sully and sketches by Whistler. Here also are memorials to former cadets, James McNeill Whistler and Edgar Allan Poe. Cullum Memorial hall, completed in 1899, resembles the second Erechtheum which stood on the Acropolis (400 B.C.). The new Cadet chapel, completed in 1910, is the most beautiful building at West Point.

Around the 60 ac. plain are the following monuments: "Dade and his Command," erected in honour of Maj. F. L. Dade, who with 110 of his men was ambushed and killed by the Seminole Indians of Florida in 1835; the French monument which was presented to the corps of cadets by the students of the L'École Polytechnique of France in 1917; a granite statue to Col. Sylvanus Thayer, the "Father of the Academy," and its superintendent from 1817 to 1835; a bronze statue of Maj. Gen. John Sedgwick, who was killed in action at Spottsylvania in 1864; Battle monument, erected to the memory of the 2,230 Regular Army officers who fell, during the Civil War, in defence of the Union; the equestrian statue of Gen. Washington, with his arm extended blessing the institution for which he was one of the first to see the need; and Kosciuszko's monument, erected by the corps of cadets in 1828 in honour of this Polish patriot.

In the hills behind the academy are seven old redoubts and connecting trails, built during the Revolutionary War. Forts Putnam, Clinton and Constitution were also built during this war. Trophy Point is rich in trophies of all American wars. In the West Point cemetery lie the remains of graduates and fellow officers of all wars, from the Revolution to the World War.

Historical Sketch.—The land now occupied by the reservation originally belonged to the British Crown. In 1723 and later in 1747, tracts were granted to settlers by royal letters-patent. The first settlement at West Point probably dates from 1723. Constitution island (280 ac.) was the gift (1908) of Mrs. Russell Sage and Miss Anna B. Warner.

At the outbreak of the Revolutionary War, both the colonists and the British realized the importance of gaining possession of the Hudson River valley, and West Point became the strategic centre. In July 1779, Gen. Washington established his headquarters at West Point in the Moore House, which stood in what is now known as Washington valley. His headquarters remained there until November. In 1880 Maj. Gen. Benedict Arnold, who had assumed command of West Point and the surrounding dependencies, committed treason in attempting to turn West Point over to the British. The plot was discovered, but Arnold fled to the British.

As early as May 1776, Gen. Knox had proposed a military school for the United States, and in October of the same year Congress passed a resolution, *"Resolved,* That a Committee of five be appointed to prepare and bring in a plan of a *Military Academy* at the Army." No action was taken until after the close of the Revolution. Gen. Washington and his military leaders agreed that West Point had been the key to the whole United States and should always be fortified. Accordingly, Washington recommended the establishment of a military school at West Point. In his annual message to Congress in 1793, and in his last message in 1796 he again strongly presented his plea for, "A Military Academy where a regular course of instruction is given." At last, March 16, 1802, Congress passed a bill providing for the establishment of a military academy and located it at West Point. The academy, with ten cadets, was first opened on July 4, 1802. By the act of Congress of April 29, 1812, the academy was reorganized with 250 cadets. In 1817 the academy was organized along its present lines. Since the establishment of the academy 16,371 cadets have been admitted and 8,486 graduated (1928).

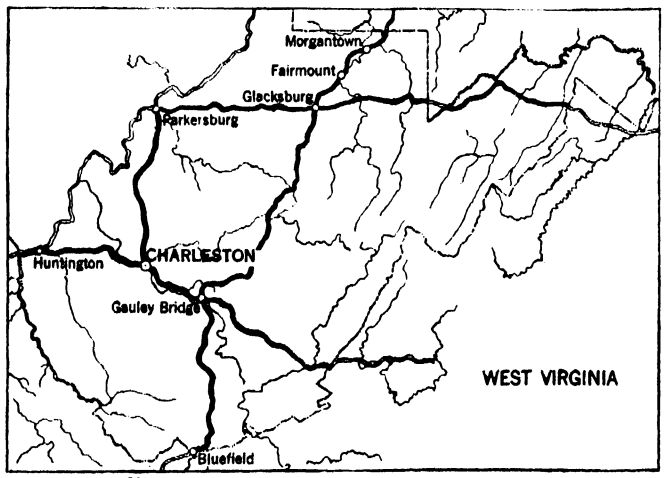
WEST VIRGINIA, a State in the Appalachian Mountain region of the eastern United States, lying between lat. 37° 10′ and 40° 40′ N., and long. 77° 40′ and 82° 40′ W. The boundaries give the State an oval shape except for two extensions, the one to the north between Ohio and Pennsylvania, and the other to the east between Maryland and Virginia, which are usually called "panhandles" and give the State its nickname, "the Panhandle State." The area is 24,170 sq.m., of which 148 sq.m. is water.

Physical Features.—The State is divided into two distinct physiographic areas (1) the Allegheny plateau on the west, comprising perhaps two-thirds of the area of the State, and forming a part of the great Appalachian plateau province which extends from New York to Alabama; and (2) the Newer Appalachian or Great valley region on the east, being a part of the large province of the same name which extends from Canada to Central Alabama. The Allegheny plateau consists of nearly horizontal beds of limestone, sandstone and shales, including important seams of coal; inclines slightly toward the north-west, and is intricately dissected by streams into a maze of narrow canyons and steep-sided hills. Along the Ohio river, these hills rise to an elevation of 800 to 1,000 ft. above sea-level, while toward the south-east the elevation increases until 3,500 and 4,000 ft. are reached along the south-east margin of the plateau, which is known as the Allegheny Front. The entire plateau area is drained by the Ohio river and its tributaries. Starting at the north the first of these tributaries is the Monongahela, which crosses into Pennsylvania before it joins the Ohio. Its headwater valleys in the north-central part of the State are among the most beautiful and fertile in West Virginia. A system of dams renders the Monongahela navigable as high as Fairmont. Farther south, entering the Ohio river at Parkersburg, is the Little Kanawha river which drains seven or eight central north-western counties. About 40 m. below, at Point Pleasant, the Great Kanawha river, the principal tributary in West Virginia, enters the Ohio. This river drains over one-third of the State and its headwaters reach far back into the long mountain valleys. On its banks the capital of the State, Charleston, is situated, and along its main valley and branch valleys several of the principal railway lines are built. The river itself is navigable as far as Montgomery, about 30 m. above Charleston, and is used regularly by barge lines. In the south-west the Gayandotte, Twelve Pole, Big Sandy and Tug rivers complete the plateau drainage system. All of West Virginia enjoys complete drainage; and not a square mile of marsh land is to be found.

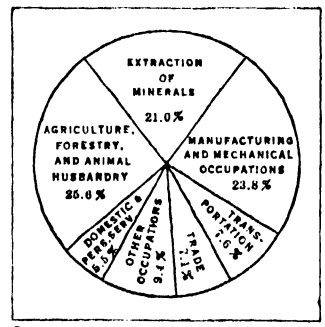


In the Newer Appalachian region, the same beds which lie horizontal in the plateau provinces were long ago thrown into folds and subsequently planed off by erosion, leaving alternate belts of hard and soft rock exposed. Uplift permitted renewed erosion to wear away the soft belts, leaving mountain ridges of hard rock separated by parallel valleys. The mountain ridges vary in height to over 4,000 ft., the highest point in the State being Spruce Knob (4,860 ft.). The parallel valleys are drained by streams flowing north-east and south-west those in the north-east being tributary to the Potomac, which flows to the Atlantic ocean, and those farther south tributary to the Great Kanawha, which enters the Ohio and then flows to the Gulf of Mexico. The valleys between

the ridges, although not always easy of access, provide broad areas of nearly level agricultural land. The rivers flowing north-east and south-west, after running between parallel ridges for long distances, often turn suddenly through transverse passes formed by erosive cutting of "gaps" through ridges. One of the best known is Harper's Ferry where the Potomac has cut through the Blue Ridge.

Flora.—The plateau portion of the State is still largely covered by hardwood forests, but along the Ohio river and its principal tributaries the valuable timber has been long removed and considerable areas have been wholly cleared for farming and pasture lands. Among the most important trees of this area are the white and chestnut oaks, the black walnut, the yellow poplar and the cherry, the southern portion of the State containing the largest reserve supply. The eastern Panhandle region has a forest region similar to that of the plateau district; but between these two areas of hardwood there is a long belt where spruce and white pine cover the mountain ridges. Other trees common in the State are the persimmon, sassafras, and, in the Ohio Valley region, the sycamore. Hickory, chestnut, locust, maple, beech, dogwood and pawpaw are widely distributed. Among the shrubs and vines are the blackberry, black and red raspberry, gooseberry, huckleberry, hazel and grape. Ginseng is an important medicinal plant. Wild ginger, elder and sumach are common, and in the mountain areas, rhododendrons, mountain laurel and azaleas.

Climate.—Like most mountain States West Virginia has a healthful climate. It does not suffer from great extremes of heat or cold. Winter temperatures range from a mean of 26° in the north-eastern mountains to 34° in the south-west along the Ohio river; the summer temperatures are 67° and 74°, respectively. Between the last killing frost in the spring and the first killing frost in the fall there is an ample growing season which in the Ohio valley is about a month longer than in the more exposed plateau and mountain districts. Precipitation is greatest in the mountains (over 50 in. annually); and it is smallest over the Ohio valley, the eastern Panhandle, and the extreme south-east (35 to 40 in. annually). Snows are frequent during the winter and sometimes deep in the higher plateau and mountain regions.



Population.—The population of West Virginia at the various censuses since its organization as a State has been as follows: 442,014 in 1870; 618,457 in 1880; 762,794 in 1890; 958,800 in 1900; 1,221,119 in 1910; 1,463,000 in 1920. The Census Bureau

MAP OF THE MAIN ROADS OF WEST VIRGINIA

estimate for July 1, 1928, was 1,724,000. The 19·9% increase in population between 1910–20 was less in rate than the increase of the four preceding decades (39·9%, 23·3%, 25·7% and 27·4%). The density of population increased from 18·4 per square mile in 1870 to 50·8 in 1910 and 57·4 in 1920.

The original settlers of West Virginia were generally English, Scotch-Irish or Pennsylvania German. To these were added a large number of Irish between 1830 and 1850 and a considerable number of Germans after 1848. The next wave of settlement came after the Civil War, when the exploitation of the coal, petroleum and natural gas resources attracted increasing numbers of Americans from neighbouring States, principally Virginia, Ohio, Pennsylvania, Kentucky, Maryland and North Carolina. Later there came an increasing number of foreigners. In 1920 foreigners numbered 61,906, or 4·5% of the white population, and were chiefly Italians, Hungarians, Poles, Austrians and Russians employed in the coal mines. Whites born of native parentage composed 89·5% of the white population. In addition, there were 86,345 negroes and 121 of all other races. The negro population had approximately doubled since 1900. Forty of the 59 counties showed an increase in population between 1910–20, those having the highest rate being Logan (183·3%), Hancock (90%), Raleigh (65%) and Harrison (54·6%). The increases were chiefly in mining and industrial centres, several of the agricultural counties showing a decrease. The percentage of population living in cities of more than 2,500 inhabitants increased from 18·7 in 1910 to 25·2 in 1920. The ten largest cities with their population for 1925 as estimated by the Census Bureau were Huntington, 63,485; Wheeling, 56,208; Charleston, 49,019; Clarksburg, 30,402; Parkersburg, 21,299; Fairmont, 20,959; Bluefield, 17,529; Morgantown, 13,811; Martinsburg, 13,544; Moundsville, 11,660.

OCCUPATIONS OF THE 491,116 PERSONS TEN YEARS OF AGE AND OVER ENGAGED IN GAINFUL EMPLOYMENT, 1920

Government.—The present Constitution which superseded the first Constitution of 1863, was adopted Aug., 1872. This Constitution may be amended (1) by a constitutional convention, the members of which shall be elected by the people and the acts of which shall be ratified by the people, or (2) by amendments which must be passed by a two-thirds majority of each house of the legislature and approved by a majority of the voters at the next general election. All citizens above 21 years of age have the right of suffrage provided they have resided in the State one year and in the county in which they expect to vote 60 days.

The executive department consists of the governor, secretary of State, superintendent of free schools, auditor, treasurer, attorney-general and commissioner of agriculture, all elected by the people at the time of the presidential election and for a period of four years. The governor is ineligible for re-election for a second consecutive term. He appoints, subject to the consent of the senate, all State officers whose selection is not otherwise provided for.

The legislature, consisting of the senate and the house of delegates, meets at the capital on the first Wednesday in January of odd-numbered years. The senate is composed (1927) of 30 members, chosen from 15 districts for a term of four years, one-half the membership retiring biennially. The house of delegates is composed (1927) of 94 members elected biennially, each county choosing at least one. A constitutional amendment, ratified in 1920, provided that all regular sessions of the legislature should convene for a period not to exceed 15 days, during which all bills are to be presented, but none but emergency bills passed or rejected. A recess of both houses must then be taken until the Wednesday after the second Monday of March following, whereupon the legislature reassembles to consider and vote upon the bills. In the reconvened session no bill may be introduced except with the consent of three-fourths of all the members elected to each house. The governor may veto a bill, or in case of an appropriation bill, the separate items, but this veto may be overridden by a simple majority of the total membership of each house. The governor may convene the house in extraordinary session if he deems it necessary.

The judicial power is vested in the supreme court of appeals, the circuit courts, such inferior courts as may be established, county courts, the powers and duties of which, however, are chiefly police and fiscal and justices of the peace. The supreme court of appeals, consisting of five judges, elected for terms of 12 years, holds regular terms twice a year at Charleston and special terms

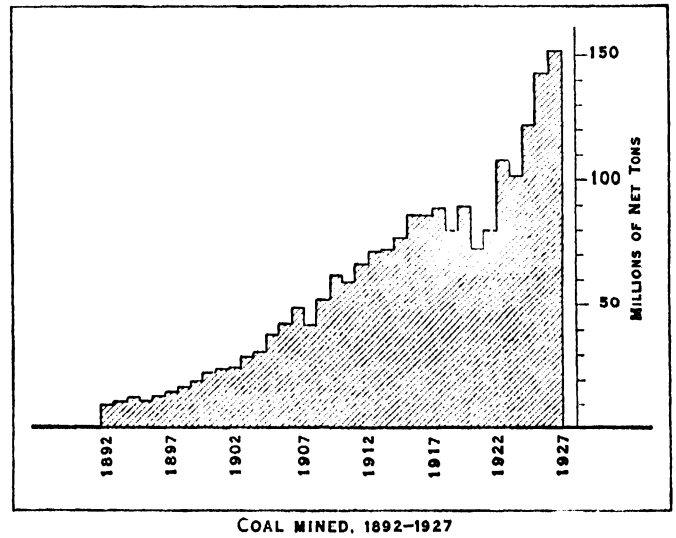
at such times and places as may be designated by the court. The circuit court is composed of 23 circuits with 24 judges. Inferior courts are established by special act of the legislature to relieve the circuit judges, and are found in eight counties of the State. Generally they have criminal jurisdiction only.

As in Virginia, the county is the unit of local government, though an unsuccessful attempt to introduce the township system was made in the first Constitution.

Finance.—The total wealth of the State as estimated by the Federal Census Bureau increased from $660,000,000 in 1900 to $4,678,000,000 in 1922. The per caput wealth in 1922 averaged $3,040. The assessed valuation of property for 1927 was $2,095,430,997. Of the 1927 valuation real estate amounted to $1,225,178,580, personal property to $387,198,230 and public utilities to $483,054,187. Counties with the highest assessed valuation in order were: Kanawha, Cabell, Harrison, Ohio, Marion and Monongalia.

On the assessed valuation in 1925 ($2,133,491,000) a direct tax totalling $48,761,528 was levied by the State, counties, school districts and municipalities. Out of each $100 levied, $6.12 was levied by the State, $32.18 by counties, $49.25 by school districts and $12.45 by municipalities. Besides the direct property tax, the State collected during the fiscal year ending June 30, 1926, a total of $6,959,287 from special taxes. Of this $3,159,152 was derived from a gross sales tax. A sales tax of two cents a gallon on gasolene (raised to four cents in 1927) netted $2,766,005. An inheritance tax contributed $802,761. The remainder was obtained from miscellaneous sources. Total receipts of the State for the same fiscal year were $81,057,978, and total disbursements were $77,479,291. For the year ending June 30, 1928, the receipts were $80,821,246 and the disbursements $88,989,495 leaving a balance of $5,680,273. In 1915 the amount of the debt to Virginia, which had been in controversy since the Civil War, was fixed by the U.S. Supreme Court at $12,393,929, plus 5% interest until paid. Besides this debt, the State had incurred a bonded debt of $47,000,000 for highway construction. Money to pay the annual interest and sinking fund is derived from auto licences and the gasolene sales tax. The total bonded indebtedness on June 30, 1928 was $56,499,700.

On June 30, 1926, there were in the State 346 banks (124 of them national banks) with resources and liabilities totalling $446,653,000. The capital, surplus and undivided profits amounted to $73,339,000. The deposits were $329,644,000, of which $154,822,000 were on time accounts.



Education.—Rapid progress in education between 1920 and 1925 is shown by the increase in the public school enrolment from 346,256 to 392,823, the increase in the days of attendance per pupil from an average of 102.8 to 128 per year, and the increase in public school expenditures from $11,402,000 to $23,777,000, or from $26.00 to $49.00 per child of school age. The days of attendance per pupil and the expenditures per pupil are still below the averages throughout the United States as a whole, but they represent an increase sufficient to place West Virginia in the lead of all other States south of the Mason and Dixon line except Maryland and Delaware. Of the 1925 enrolment 360,399 were in the kindergartens or elementary schools. High school enrolment increased from 16,360 in 1920 to 33,603 in 1927, and the number of high schools from 164 to 225 in 1927. There were in 1927, 12,062 elementary and 2,775 high school teachers to whom a total of $17,001,094 was paid in salaries. There were, in 1924, 8,571 pupils in private schools.

The New River State school at Montgomery and the Potomac State school at Keyser came into existence as State-supported preparatory schools at a time when there was a dearth of public high schools. They continue to offer the final two years of preparatory work and have added the first two years of college work, so that they operate as junior colleges. There were in 1928 six State normal schools for whites. Three of them, located at Huntington, Fairmont and Athens, gave complete four-year teacher's courses. One, located at Glenville, gave a two-year normal course, while the remaining two, located at West Liberty and Shepherdstown gave both a two-year normal and a two-year junior college course. Bluefield Coloured Institute at Bluefield, serving the coloured population in the southern part of the State, gives a regular high school course, plus normal and junior college courses. West Virginia Collegiate Institute at Institute, also serves the coloured population, offering preparatory, normal and college courses. There are State schools for the white deaf and blind at Romney and for the coloured at Institute. West Virginia university is located at Morgantown, and is divided in its organization into colleges of arts and science, engineering, agriculture, law and school of medicine and pharmacy. Private denominational colleges of importance are Bethany college at Bethany, West Virginia Wesleyan college at Buckhannon, Davis and Elkins at Elkins, Greenbriar college (for women) at Lewisburg, Salem college at Salem and Morris Harvey college at Barboursville.

Charities and Corrections.—In 1925 there were 14 State charitable, correctional or penal institutions in operation, all of them managed and governed by the State board of Control. The governor appoints the chief executive officer or head of each institution. There is a State board of children's guardians which has control and custody over dependent and neglected children.

Mines and Quarries.—The extraction of minerals is the most important industry in the State. Mineral products were valued at $412,866,535 in 1923, and $350,000,000 in 1927. In 1923 West Virginia ranked second among the States in total value of its mineral output, but in 1925 it dropped to fifth place. The decrease in the value of the coal output and the increased value of petroleum produced in other States were chiefly responsible for the decrease in rank. Next to coal the chief minerals, according to the value of their 1925 output, were: natural gas, petroleum, clay products, natural gas gasolene, stone, sand and gravel and lime.

The production of coal has increased with remarkable rapidity. In 1923, for the first time the State's production exceeded 100,000,000 tons. In 1925 it amounted to 123,061,985 tons, and in 1926 it reached 147,209,000 tons, an increase of approximately 40,000,000 tons in two years, but in 1927 it declined to 146,088,121 tons. In 1926 the output was but slightly below that of Pennsylvania, the leading State in the production of bituminous coal. It amounted also to more than one-fourth the supply of bituminous coal mined in the United States in that year. During the year 1925 there were 793 companies reporting 1,208 operating coal mines. The total of all men employed in connection with the coal

COAL MINED, 1892–1927

mines was 117,748. During the year 1925 the average price received by the pick miner was $0.51 per ton, or an average annual wage of $1,502. Mines operated an average of 155 days in 1924 and 194 days in 1925. The State department of mines regularly inspects all mines and maintains mine rescue stations at Charleston, Kilsythe, Elkins, Meadowbrook and Williamson. Between 1910 and 1923 labour troubles were frequent in the mining districts, due mainly to the determined attempts of the unions to organize the West Virginia miners. During the strikes of bituminous miners in 1927 and 1928, however, West Virginia remained

generally quiet. At the present rate of consumption West Virginia alone could supply the whole United States with coal for 250 years to come.

From 1909 to 1924 West Virginia held first place among the States in the production of natural gas, but in 1924 dropped to third place, being passed by Oklahoma and California. The gradual decrease in production is revealed by contrasting the 244,004,000,000 cu.ft. produced in 1915 with 180,000,000,000 cu.ft. produced in 1927. In 1925, 74,250,000,000 cu.ft. were consumed in West Virginia and the remainder in Ohio, Pennsylvania, Kentucky and Maryland to which it was transported by underground pipe lines. A large share was used in the production of gasolene. In 1924 there were 152 plants which produced 61,549,000 gal. valued at $7,154,000. There were also 18 plants producing carbon black from natural gas, the output of which was valued at $1,125,000 in 1924.

Between 1880 and 1910 West Virginia was one of the leading petroleum producing States of the Union. The peak of production was reached in the year 1900 when the State ranked second in output. Production then began to decline. From 1911 to 1915 the annual average was 10,487,000 bbl.; in 1926 it amounted to 5,975,000 barrels. The rank in 1926 was 19th; activity continued, nevertheless.

In 1924 there were 57 stone quarrying plants producing 2,618,290 short tons of stone valued at $3,040,154. Of this 2,334,250 tons were limestone and 284,040 tons were sandstone. Much limestone was also used for burning lime. West Virginia is also the centre of the sand supply for its own 65 glass plants (in 1928), as well as those in eastern Ohio and western Pennsylvania. Sand used for this purpose in 1924 amounted to 516,638 short tons, valued at $1,188,093. Other sand and gravel valued at $2,012,555 was used for building and road-paving purposes. Salt fields on the Gauley river, on the Kanawha from Kanawha falls to Pt. Pleasant and up the Ohio river to Pomeroy Bend are still active and use the evaporative process. Iron deposits in Hampshire, Hardy and Grant counties may be valuable.

Agriculture and Live Stock.—Agriculture plays an important rôle in the State. In 1925 there were 90,380 farms upon which 455,204 people, or 27·8% of the total population, made their homes. Farm lands occupied 8,979,847 ac. of the 15,374,080 ac., estimated land area of the State. Of this farm acreage, 1,921,139 ac. was reported as crop land. The value of farm property in 1925 amounted to $374,841,159 (land, $251,792,653; buildings, $104,360,000; implements and machinery, $15,686,000); the value of livestock on farms was estimated at $36,318,000. In 1925 and 1926 the crop value amounted to $75,700,000 and $74,700,000 respectively.

For a long period after settlement agriculture was backward in West Virginia. Pioneer conditions lasted longer in the mountains, transportation was poor, and the hills and streams discouraged all but a limited and patchy cultivation of crops. Farmers passed the State by for the more level fields of the prairie west. After 1880 development was constant until about 1910. The World War was responsible for a temporary increase in activity and production, but the period of agricultural depression that followed resulted in a serious setback. Between 1920 and 1925 there was a decrease of 22,720 in farm population; a decrease in area of farm land amounting to 589,941 ac., a decrease of $55,000,000 in value of farm land; a decrease of $28,000,000 in value of farm livestock. Counties with the greatest percent of their area in farm lands were: Jackson (91·5%), Gilmer (91·1%), Lewis (88·1%), Cabell (88%), Marshall (86·8%), Clay (86·4%), Roane (85·5%).

The acreage of important crops in 1926 was as follows: tame hay, 771,000; Indian corn, 499,000; oats, 207,000; wheat, 147,000; potatoes, 47,000; buckwheat, 36,000; rye, 12,000; tobacco, 10,000. The total value of important crops was in 1926 as follows: tame hay, $19,691,000; Indian corn, $15,479,000; potatoes, $8,320,000; oats, $3,420,000; wheat, $3,175,000; tobacco, $1,615,000; buckwheat, $684,000; sweet potatoes, $528,000 and rye, $172,000. Besides field crops there are orchard crops valued annually from $8,000,000 to $10,000,000. Fruit is raised chiefly in the eastern and northern Panhandles. The leading apple counties in 1926 were Berkeley, Hampshire, Jefferson and Morgan. Tobacco is cultivated mainly in the south-west near the Kentucky border. The other crops are well distributed.

A large share of the crop of the State is fed to the live stock. An incentive to live stock raising is the large amount of excellent pasture land on the hillsides or in the stream bottoms. Water for the animals is everywhere abundant. In 1927 there was a total of 1,330,000 animals, valued at $37,982,000, a decrease in valuation of $406,000 since 1925. There were 484,000 cattle (207,000 of them milk cows), 133,000 horses, 509,000 sheep, 189,000 swine and 15,000 mules. Chickens in 1925 were valued at $4,164,255. About 5,000,000 are raised annually.

Manufactures.—There has been a steady advance in manufacturing. In 1914 there were 2,749 establishments employing 71,078 wage earners at a total of $43,784,000 in wages and producing an output valued at $193,511,000. In 1925 the establishments had decreased to 1,395, or almost half, but wage earners had increased to 80,700, wages had more than doubled, amounting to $105,892,000, and the value of products was close to 2½ times that of 1914, or $470,821,582. In 1927 the capital invested amounted to $536,282,093 and the value of the products was $576,688,822. Leading, with a value of $92,565,227 in 1925, are the products of the 16 steel works and rolling mills in the State. Products of the 64 glass factories were second with a value of $47,884,426. Third, with a value of $33,347,557, were the products of car and general construction in repair shops of steam railroads. Lumber and timber products amounted to $26,787,495, to which may be added products valued at $8,247,546 of planing mills. Other leading industries and their values in 1925 were: slaughtering and packing, $14,620,703; leather (tanned, curried and finished), $13,348,975; petroleum refining, $11,865,085; pottery, including porcelain ware, $10,535,436 and coke, $10,109,703. Wheeling, Huntington and Parkersburg are the chief industrial centres.

The State is rich in power resources which should have much to do with the future growth of industry. The vast coal resources are close at hand. Natural gas in many instances furnishes a still cheaper power. Finally, with one exception, the State has greater potential water-power in her rivers than any State east of the Mississippi river.

Transportation and Commerce.—Railway development in West Virginia has been due largely to the exploitation of the coal and lumber. The mileage increased from 2,228 in 1900 to 3,996 in 1920 and 4,595 in 1928. Despite the increased use of motor vehicles no railroad mileage has been abandoned as in other States. Since the issue of bonds to the amount of $50,000,000 in 1919, road building has proceeded with great rapidity. Of the 3,785 m. in the State system in 1928 there were 2,366 m. paved and 878 m. graded or partly graded. Motor vehicles increased in number from 13,279 in 1915 to 227,836 in 1926. The river and its branches are used for the shipment of coal.

History.—The western part of Virginia was not explored until long after considerable settlements had been made in the east. In 1671 Abraham Wood, able trader and frontiersman, sent out a party under Capt. Thomas Batts, which ascended the Roanoke river in south-western Virginia and crossed near its headwaters to the New river, a westward flowing stream. This river they descended to the point where it breaks through Peter's mountain at Peter's falls on the Virginia-West Virginia boundary. The pass was later to be one of the chief highways of early western trade and settlement. Other explorations in the 17th century are unknown. Doubtless after 1700 pioneer traders with the Indians frequently penetrated the Potomac region above Harper's Ferry, but with the exception of Van Metre, who in 1725 traversed the valley of the South Branch, they left no record. In 1726 or 1727 the first known cabins in the State were built at Shepherdstown by some Germans from Pennsylvania who crossed the Potomac at the "Old Pack Horse Ford" and by Morgan Morgan on Mill Creek in Berkeley county. Within a few years other settlers from Pennsylvania and Maryland settled on various creeks flowing into the Potomac as far west as the South Branch. In 1736 an exploring party traced the Potomac to its source. Advance

up the South Branch was rapid. The diary kept by George Washington, who between 1748 and 1751 surveyed much of this land for Lord Fairfax, recorded many squatters, largely of German origin, in the region. The insecurity of title on the Fairfax grant prompted many to go still higher up the branch and its forks into Pendleton county. By 1750 a few of the frontiersmen were crossing the Allegheny divide into the Greenbriar and other rivers whose waters eventually reached the Ohio. Christopher Gist, a surveyor in the employ of the first Ohio company, in 1751–52 explored the country along the Ohio river north of the mouth of the Great Kanawha. Later the Ohio company, merged with the Walpole company, sought to secure from the king the formation of a 14th colony with the name "Vandalia." The westward advance was abruptly terminated by the outbreak of the French and Indian War (1754–63) and many of the settlements were forced back by Indian depredations. At the close of this war the English king, hoping thereby to prevent future conflicts with the Indians, issued (1763) a proclamation forbidding further settlement beyond the divide until arrangements could be made with the Indians, but this proclamation was ignored Between 1764 and 1774, when settlement was again temporarily stopped by Indian attacks, it is estimated that the line of settlement advanced across the Alleghenies and through the wilderness to the Ohio at an average rate of 17 m. per year. The valleys first settled were those of the Monongahela, Greenbriar and the New Rivers and thence down the Great Kanawha to the Ohio. By 1775 it is estimated that there were 30,000 people in the West Virginia region. In the face of this relentless advance the savages grew more hostile. The result was Dunmore's War of 1774. The governor of Virginia, Lord Dunmore, led a force over the mountains, and cooperating with a body of militia under Gen. Lewis, dealt the Shawnee Indians under Cornstalk a crushing blow at Point Pleasant (*q.v.*) at the junction of the Kanawha and Ohio rivers. During the Revolutionary War which followed closely, the settlers in West Virginia were generally active Whigs and many served in the Continental army.

Social conditions in western Virginia were entirely unlike those existing in the eastern portion of the State. The population was not homogeneous, as a considerable part of the immigration came by way of Pennsylvania and included German, the Protestant Scotch-Irish and settlers from the States farther north. During the Revolutionary War the movement to create another State beyond the Alleghenies was revived, and a petition (1776) for the establishment of "Westsylvania" was presented to Congress, on the ground that the mountains made an almost impassable barrier between the west and the east. The rugged nature of the western country made slavery unprofitable, and time only increased the social, political and economic differences between the two sections of the State. The convention which met in 1829 to form a new Constitution for Virginia, against the protest of the trans-Allegheny counties, continued to require property qualification for suffrage, and gave the slave-holding counties the benefit of three-fifths of their slave population in apportioning the State's representation in the lower Federal House. As a result every county beyond the Alleghenies except one voted to reject the Constitution, which was nevertheless carried by eastern votes. Though the Virginia Constitution of 1850 provided for white manhood suffrage, the distribution of representation among the counties was such as to give control to the section east of the Blue Ridge mountains. Another grievance of the West was the disproportionate expenditure for internal improvements at State expense in the east.

The Civil War merely furnished the occasion for separation from the mother State. In 1861 when the Virginia convention adopted the Ordinance of Secession only nine of the 46 delegates from the present State of West Virginia voted to secede. After the ordinance had been ratified by the people, a convention of newly elected trans-Allegheny members of the legislature, and other delegates, met at Wheeling (June 11, 1861) and declared the acts of the Secession Convention void, and declared vacant the offices of those in the Virginia government which adhered to it. A second Wheeling convention formed the "reorganized" government of Virginia, chose Francis H. Pierpont as governor and provided for the election of other officials and a legislature. In August the convention reassembled at Wheeling and adopted an ordinance providing for a popular vote on the formation of a new State. At the subsequent election there were 18,489 votes cast for a new State and only 781 against. A constitutional convention (delegates to which were elected on Oct. 24) met at Wheeling in Nov. 1861, and in Feb. 1862 submitted a Constitution which was ratified by the people in April. In May 1862 the legislature of the "restored Government" voted its consent to the erection of the proposed new State. Application for admission to the Union was then presented to Congress, which granted its permission subject to the insertion of a Constitutional provision for the gradual abolition of slavery. On June 20, 1863, following the addition of this provision the State was admitted.

During the Civil War trans-Allegheny West Virginia suffered comparatively little. McClellan's forces gained possession of the greater part of the territory in the summer of 1861, and Union control was never seriously threatened. In 1863, however, Gen. Imboden, with 5,000 Confederates, overran a considerable portion of the State. Bands of guerrillas burned and plundered in some sections and were not entirely suppressed until after the war ended. The State furnished about 36,000 soldiers to the Federal armies and somewhat less than 10,000 to the Confederate. After the war partisan feeling ran high. In 1866 the State adopted a constitutional amendment disfranchising all who had given aid to the Confederacy. In 1871, however, even before the Democratic Party secured political control, the amendment was abrogated by the adoption of the Flick amendment. In 1872 an entirely new Constitution was adopted under Democratic control. The Democrats continued to carry the State until 1896 when the elections were carried by the Republicans. Republican rule thereafter was not broken till 1916, when a Democratic governor was chosen. Republican strength is due to the increasing industrial development of the State, which has brought capital and settlers from neighbouring Northern States.

The largest chapter in the history of the State is doubtless that dealing with this great industrial awakening. The East had an increasing demand for timber, coal and oil and West Virginia was close at hand. The former handicap of lack of transportation was overcome after the Civil War by the rapid extension of railway lines up the principal valleys. Petroleum, first obtained in large quantities on the Little Kanawha river in 1860, increased in production slowly until 1889 and thereafter, with the discovery of new sands and new drilling methods, rapidly until 1900 when the State ranked second in the Union in output. Coal mining, which had scarcely begun before the Civil War, increased slowly until the nineties when it responded to the demands of Pittsburg and other cities. It is now an important economic factor in the life of the State.

BIBLIOGRAPHY.—The *West Virginia Handbook and Manual* published annually by the clerk of the senate contains much important information of miscellaneous nature. The reports of the State departments and commissions are brought together biennially in *West Virginia Public Documents*, and are invaluable. For general description *see* H. Gannett, "Gazetteer of West Virginia," being *Bulletin 233* of the U.S. Geological Survey (1904). For detailed descriptions of counties and natural resources *see* the *County Reports* and *Bulletins* of the West Virginia Geological Survey. For history *see* V. A. WEST WARWICK, in Rhode Island, U.S.A. Pop. (1920) 15,461 (31% foreign-born white) and 18,215 in 1925 (State census). It embraces several manufacturing villages with large cotton mills, and the aggregate factory output in 1925 was valued at $10,148,112. West Warwick was organized in 1913.

WETHERSFIELD, a town of Hartford county, Connecticut, U.S.A. Population (1920) 4,349; 1928 local estimate 7,000. It is a beautiful old town, a residential suburb of Hartford and the seat of the Connecticut State prison. Among the interesting old buildings are the Webb house, in which Washington and Count de Rochambeau met in 1781 to plan the Yorktown campaign; the First Church of Christ (Congregational), built in 1761; and the old academy building (1804) now used for town offices and the public library. There is a giant elm on Broad Street Green with a girth of 26·5 feet. Wethersfield was settled in 1634, by colonists from Watertown, Mass., and is the oldest permanently inhabited town in the State. With Hartford and Windsor in 1639 it framed the Fundamental Orders of the Colony of Connecticut.

WETTIN, the name of a family from which several of the royal houses of Europe have sprung. The earliest known ancestor is one Dietrich, count of Hassegau or Hosgau, on the left bank of the Saale, who was killed in 982. His sons Dedo I. (d. 1009) and Frederick (d. 1017) received lands taken from the Wends, including the county or *Gau* of Wettin on the right bank of the Saale. Dedo's son Dietrich II. married Matilda, daughter of Ekkard I., margrave of Meissen. Their son Dedo II. obtained the Saxon east mark and lower Lusatia in 1046, but in 1069 quarrelled with the emperor Henry IV. and was compelled to surrender his possessions. He died in 1075, and his lands were granted to his son Henry I., who in 1089 was invested with the mark of Meissen. In 1103 Henry was succeeded by his cousin Thimo (d. 1104), who built a castle at Wettin, and was called by this name. Henry II., son of Henry I., followed, but died childless in 1123; his cousin, Conrad I., son of Thimo, claimed Meissen, of which he secured possession in 1130, and in 1135 the emperor Lothair II. added lower Lusatia to his possessions. Conrad, abdicating in 1156, his lands were divided between his five sons, when the county of Wettin fell to his fourth son Henry, whose family died out in 1217. Wettin then passed to the descendants of Conrad's youngest son Frederick, and in 1288 the county, town and castle of Wettin were sold to the archbishop of Magdeburg, eventually becoming incorporated in the kingdom of Prussia.

Conrad I. and his successors had added largely to their possessions, until under Henry I., the Illustrious, margrave of Meissen, the lands of the Wettins stretched from the Oder to the Werra, and from the Erzgebirge to the Harz mountains. The subsequent history of the family is merged in that of Meissen, Saxony and the four Saxon dukedoms. In June 1889 the 800th anniversary of the rule of the Wettins in Meissen and Saxony was celebrated with great splendour at Dresden.

WEXFORD, a county of Ireland in the province of Leinster, bounded north by Wicklow, east and south by St. George's Channel, and west by Waterford, Kilkenny and Carlow. The area is 576,757 acres or about 902 sq. miles. Pop. (1926) 95,812. Owing to the number of sandbanks navigation is dangerous near the shore. The only safe harbour on the east coast is Wexford Harbour, which, owing to a bar, is not accessible to large vessels at ebb-tide. The artificial harbour of Rosslare, outside Wexford Harbour to the south, was therefore opened in 1906. On the south coast the great inlet of Waterford Harbour separates the county from Waterford and Kilkenny, and among several inlets Bannow Bay is the largest. South from Crossfarnogue Point are the Saltee Islands, and Coningmore and Coningbeg, beyond the latter of which is the Saltee lightship. South-east from Greenore Point is the Tuskar Rock.

An elevated ridge on the north-western boundary forms the termination of the granitic range in Wicklow, and in Croghan Kinshela, on the borders of Wicklow, rises to a height of 1,985 feet. On the western border, another range, situated chiefly in Carlow, extends from the valley of the Slaney at Newtownbarry to the confluence of the Barrow with the Nore at New Ross, and reaches 2,409 ft. in Blackstairs Mountain, and 2,610 ft. in Mount Leinster on the border of Co. Carlow. In the southern district, a hilly region, reaching in Forth Mountain a height of 725 ft., forms with Wexford Harbour the northern boundaries of the baronies of Forth and Bargy, a peninsula of flat and fertile land. The river Slaney enters the county in the north-west and flows south-east to Wexford Harbour. Its chief tributary, the Bann, flows south-westwards from the borders of Wicklow. The Barrow forms the western boundary of the county from the Blackstairs mountains till its confluence with the Suir at Waterford Harbour.

The northern portion of Wexford was included in *Hy Kinselagh*, the peculiar territory of the Macmorroughs, overlords of Leinster, who had their chief residence at Ferns. Dermod Macmorrough, having been deposed from the kingdom of Leinster, asked help of Henry II., king of England, secured the aid of Strongbow, and obtained assistance from Robert Fitzstephen and Maurice Fitzgerald of Wales. In 1169 Fitzstephen landed at Bagenbon on the south side of Fethard, and captured the town of Wexford. After this Dermod granted the territory of Wexford to Fitzstephen and Fitzgerald. Macmorrough having died in 1172, Strongbow became lord of Leinster. At first Henry II. retained Wexford, but in 1174 he committed it to Strongbow.

Wexford was one of the twelve counties into which the conquered territory in Ireland is generally stated to have been divided by King John, and formed part of the possessions of William Marshal, earl of Pembroke. It ultimately passed to John Talbot, earl of Shrewsbury, who in 1446 was made earl of Waterford and baron of Dungarvan. In 1474 George Talbot was seneschal of the liberty of Wexford. The district was actively concerned in the rebellion of 1641; and during the Cromwellian campaign the town of Wexford was carried by storm in 1649. Wexford was the chief seat of the rebellion of 1798, the leaders there being the priests.

Evidences of the Danish occupation are seen in the numerous raths, or encampments, especially at Dunbrody, Enniscorthy and New Ross. Among the monastic ruins special mention may be made of Dunbrody abbey, of great extent, founded about 1178 for Cistercian monks by Hervey de Montmorency, marshal of Henry II.; Tintern abbey, founded in 1200 by William Marshal, earl of Pembroke, and peopled by monks from Tintern abbey in Monmouthshire; the abbey of St. Sepulchre, Wexford, founded shortly after the invasion by the Roches, lords of Fermoy; Ferns abbey, founded by Dermod Macmorrough (with other remains including the modernized cathedral of a former see, and ruins of a church); and the abbey of New Ross, founded by St. Alban in the 6th century. Old castles include Ferns, dismantled by Parliamentary forces in 1641, and occupying the site of the old palace of the Macmorroughs; Enniscorthy, founded by Raymond le Gros; Carrick Castle, near Wexford, the first built by the English; and the fort of Duncannon.

The soil of the county of Wexford consists mostly of a cold stiff clay resting on clay-slate. Pre-glacial sands and gravels are used for liming fields, under the name of "manure gravels," on account of the fossil shells which they contain. The interior and western districts are much inferior to those round the coasts. In the south-eastern peninsula of Forth and Bargy the soil is a rich alluvial mould mixed with coralline sandstone and limestone. The peninsula of Hookhead, owing to the limestone formation, is specially fruitful. In the western districts of the county there are large tracts of turf and peat-moss. The principal crops are barley, oats, potatoes and turnips. The numbers of cattle, sheep, pigs and poultry are well maintained. Except in the town of Wexford the manufactures and trade are of small importance. The town of Wexford is the headquarters of sea and salmon fishing districts, and there are a few fishing villages on the inlets of the south coast.

A branch of the Great Southern railway enters the county from the north-east and serves Wexford by way of Enniscorthy, with a branch westward to New Ross from Macmine Junction. Palace East, on this branch line, is also served by the Kildare line of the same system. Wexford has railway connections with Rosslare, and a line across the south of the county connects it also with

Waterford (Co. Waterford). There is water communication for barges by the Slaney to Enniscorthy; by the Barrow for larger vessels to New Ross, and by this river and the Grand Canal for barges to Dublin.

The administrative county of Wexford returns five members to Dáil Eireann.

WEXFORD, a seaport and the county town of Co. Wexford, Ireland. Pop. (1926) 11,870. Wexford was an early colony of the English, having been taken by Fitzstephen. It was the second town that Cromwell besieged in 1649. It was garrisoned for William III. in 1690. In 1798 it was made the headquarters of the rebels, who, however, surrendered it on the 21st of June. In 1318 the town received a charter from Aymer de Valence, which was extended by Henry IV. in 1411, and confirmed by Elizabeth in 1558. By James I. it was in 1608 made a free borough corporate. Wexford Harbour, formed by the estuary of the Slaney, is about 5 m. from north to south and about 4 from east to west. There are quays extending nearly 900 yd. A bar at its mouth prevents the entrance of vessels drawing more than 12 ft. An artificial harbour was therefore opened at Rosslare in 1906, and this is connected with Wexford by a railway (8¾ m.) owned by the Great Southern company, and is served by the passenger steamers of the Great Western railway of England from Fishguard. Some remains exist of the old walls and flanking towers. The Protestant church, near the ruins of the ancient abbey of St. Sepulchre or Selsker, is said to occupy the spot where the treaty was signed between the Irish and the English invaders in 1169. At Carrick, 2 m. W., the Anglo-Normans erected their first castle. The principal exports are agricultural produce, live stock and whisky. Shipbuilding is carried on, and also tanning, malting, brewing, iron-founding, distilling and the manufacture of artificial manure, flour, agricultural implements, and rope and twine. Wexford is the headquarters of salmon and sea fishery districts.

WEYBRIDGE, an urban district in Surrey, England; Pop. (1921) 6,684. It lies in the flat valley of the river Wey, 1 m. above its junction with the Thames. The river is locked up to Godalming, and navigation is assisted by cuts. The Roman Catholic church of St. Charles Borromeo was the temporary burial place of Louis Philippe, who lived at Claremont in Esher, and other members of his family. In 1907 the Brooklands racing track for motor-cars was opened near Weybridge. It has a circuit of 2$\frac{1}{16}$ m. round the inner edge, and including the straight finishing track is 3¼ m. in total length; its maximum width is 103 ft., and it will take ten cars abreast.

WEYDEN, ROGIER VAN DER [originally ROGER DE LA PASTURE] (*c.* 1400–1464), Flemish painter, was born in Tournai, and there apprenticed in 1427 to Robert Campin. He became a gild master in 1432 and in 1435 removed to Brussels, where he was shortly after appointed town painter. His four historical works in the Hôtel de Ville have perished, but three tapestries in the Bern museum are traditionally based on their designs. In 1449 Rogier went to Italy, visiting Rome, Ferrara (where he painted two pictures for Lionel d'Este) and Milan. The well-known little Madonna with four saints at Frankfort, was probably painted at Florence. The "Entombment" in the Uffizi was probably also painted in Italy. On returning (1450) he executed the triptych with half-length figures of Christ, the Virgin and saints in the Louvre; and for Pierre Bladelin the "Magi" triptych, now in the Berlin gallery. Van der Weyden's style is dry and severe as compared with the painting of the Van Eycks, his colour is less rich than theirs, and he lacks their sense of atmosphere. On the other hand, he cared more for dramatic expression, particularly of a tragic kind, and his pictures have a deeply religious intention. Comparatively few works are attributed with certainty to this painter; early works are: "The Descent from the Cross" in the Chapter House of the Escorial; the John the Baptist three-panel altar-piece in the Berlin Museum; the three-panel altar-piece of the Virgin, two panels of which are in Granada Cathedral and the third in the Metropolitan Museum of Art, New York; the "Crucifixion" at the Vienna gallery; that in the Johnson collection, Philadelphia. The "Seven Sacraments" altar-piece at Antwerp is almost certainly his, likewise the triptych of the Beaune hospital. Notable portraits are: Lionello d'Este in the Friedman collection, New York and Charles the Bold in the Berlin Museum. Among his later works are "The Annunciation" in the Metropolitan Museum of Art, New York, and the triptych with the "Adoration of the Kings," the "Annunciation" and the "Presentation" in the Munich Pinakothek. Van der Weyden attracted many followers and his influence was widespread. It is evident in the work of Dierich Bouts, Memline and Martin Schongauer. He died at Brussels on June 16, 1464 and was buried in the church of St. Gudule.

See Sir Martin Conway, *The Van Eycks and their Followers* (1921); M. Friedländer, *Roger van der Weyden, Die alt niederländische Malerei* (1925).

WEYGAND, MAX (1867–), French soldier, was born at Brussels Jan. 21, 1867. Having entered the military college at St. Cyr in 1885, as a foreigner, he proceeded to the cavalry school at Saumur. He was appointed sub-lieutenant in 1888 and after successive promotions commanded the 5th Hussars in 1912. On Sept. 21, 1914, as a temporary colonel, he was appointed chief of the general staff of an army, and in Aug. 1916 he was made a general of brigade. From the outset of the World War he was the immediate assistant of Marshal Foch, whom he succeeded as the French representative on the Inter-Allied General Staff in 1917. In April 1918 he resumed his work as Chief of the General Staff under Marshal Foch, which post he held during the remainder of the War; and in this capacity he was considered by many to be what Berthier was to Napoleon.

But, and here the balance was in his favour, he proved himself capable of personally directing operations on a very large scale in Poland. In Aug. 1920, when Warsaw was surrounded and threatened by a Soviet army, at a distance of only 20 km., Gen. Weygand arrived, and speedily reconstituting the disorganised Polish army, launched an offensive against the Bolsheviks' vulnerable points. In December the enemy was in retreat. When the people of Warsaw acclaimed him, he said: "My rôle was merely to fill up the gaps; it was the heroic Polish nation itself which won the victory."

Weygand became a member of the *Conseil Supérieur de la Guerre,* and was made a grand officer of the Legion of Honour on Sept. 1, 1920. In Nov. and Dec. 1922 he served as military expert on the French delegation to the Lausanne Conference, and in Jan. 1923, he was sent to the Rhine to inspect the Allied troops. The same year he succeeded Gen. Gouraud as high commissioner in Syria, where he proved himself to be a remarkable organiser. He was recalled to Paris on Nov. 29, 1924, and placed in charge of the *Centre des Hautes Études Militaires.*

WEYLER Y NICOLAU, VALERIANO, marquess of Tenerife (1839–), Spanish soldier of Prussian descent, born at Palma de Majorca. He entered at sixteen the military college of infantry at Toledo, and when he attained the rank of lieutenant, passed into the staff college, from which he came out at the head of his class. Two years afterwards he became captain, and was sent to Cuba at his own request. He distinguished himself in the expedition to Santo Domingo, especially in a daring reconnaissance with few men into the heart of the enemy's lines, for which he got the cross with laurels of San Fernando. From 1868 to 1872 he served also brilliantly against the Cuban rebels, and commanded a corps of volunteers specially raised for him in Havana. He returned to Spain in 1873 as brigadier-general and took an active part against the Carlists in the eastern provinces of the Peninsula in 1875 and 1876, for which he was raised to the rank of general of division. Then he was elected senator and created marquess of Tenerife. He was captain-general in the Canary Isles (1878–83) and afterwards in the Balearic islands and in the Philippines (1888)—where he dealt very sternly with the native rebels of the Carolines, of Mindanao and other provinces. On his return to Spain in 1892 he was put in command of the 6th Army Corps in the Basque Provinces and Navarre where he soon quelled agitations, and then became captain-general at Barcelona until Jan. 1896. In Catalonia, with a state of siege, he made himself the terror of the anarchists and socialists. On the failure of Martinez Campos to pacify Cuba, Weyler was sent out by the Conservative government of Cánovas del Castillo, and this selection met the approval of most Spaniards,

who thought him the proper man to crush the rebellion. Weyler attempted to do this by a policy of inexorable repression which raised a storm of indignation and led to a demand from America for his recall. This recall was granted by the Liberal Government of Sagasta, but Weyler afterwards asserted that, had he been left alone, he would have stamped out the rebellion in six months. After his return to Spain his reputation as a strong and ambitious soldier made him one of those who in case of any constitutional disturbance might be expected to play an important rôle, and his political position was naturally affected by this consideration; his appointment in 1900 as captain-general of Madrid resulted indeed in more than one ministerial crisis. Twice minister of war (1901, 1905), he was captain-general at Barcelona (Oct. 1909) and, without bloodshed, quelled the disturbance connected with the execution of Francisco Ferrer.

WEYMAN, STANLEY JOHN (1855–1928), English novelist, was born at Ludlow, Shropshire, on Aug. 7, 1855, the son of a solicitor. He was educated at Shrewsbury School, and at Christ Church, Oxford. He was called to the bar at the Inner Temple in 1881, joining the Oxford circuit. He had been practising as a barrister for eight years when he made his reputation as a novelist by a series of romances dealing with French history: *The House of the Wolf* (1889), *A Gentleman of France* (1893), *Under the Red Robe* (1894), *Memoirs of a Minister of France* (1895), and others. He died on April 10, 1928.

Among his later novels were: *Shrewsbury* (1897), *The Castle Inn* (1898), *Sophia* (1900), *Count Hannibal* (1901), *In King's Byways* (1902), *The Long Night* (1903), *The Abbess of Vlaye* (1904), *Starvecrow Farm* (1905), *Chipping* (1906), *The Wild Geese* (1908), *The Great House* (1919), *Ovington's Bank* (1922), *The Traveller in the Fur Cloak* (1925), *Queen's Folly* (1925).

WEYMOUTH, a town of Massachusetts, U.S.A., Pop. (1920) 15,057 (82% native white); 1928 local estimate 20,000. The town's area of 19 sq.m. includes four islands besides the peninsula between the Weymouth Fore River and the Weymouth Back River. On the latter, about 2 m. from its mouth, is a U.S. naval magazine. The surface of the country is rough: Great Hill (at one of the narrowest parts of the peninsula) is about 140 ft. above the rivers. In the township are the Fogg Library (1898, in South Weymouth) founded by a bequest of John S. Fogg; and the Tufts Library (1879, in Weymouth village), endowed by Quincy Tufts and his sister Susan Tufts. Traffic on the two rivers in 1925 amounted to 1,085,516 tons, valued at $9,861,331. In 1635 the plantation of Wessaguscus (settled by Thomas Weston in 1622) was incorporated as a town. In 1637, Round and Grape islands were annexed.

WEYMOUTH and **MELCOMBE REGIS,** a seaport, of Dorsetshire, England. Pop. (1921) 24,556. It is formed of Weymouth, on the Wey, and Melcombe Regis on the north-east of the river, the two towns being contiguous. The situation is enclosed to the south by the Isle of Portland. A mile S.W. of Weymouth is Sandsfoot Castle, a fort erected by Henry VIII. for the protection of the shipping. The exports include Portland stone. The G.W.R. provides passenger steamers to Guernsey and Jersey.

Bronze weapons and Roman interments have been found, but first mention of "that place called Weymouth" occurs in charters of King Aethelred, dated 866–871 and 895–940. The first charter was granted in 1252 by the prior and convent of St. Swithin, to whom the manor had been granted by Edward the Confessor. By this Weymouth was made a free borough and port for all merchants, the burgesses holding their burgages by the same customs as those of Portsmouth and Southampton. The demand of six ships from the town by the king in 1324 shows its importance in the 14th century, but there is no mention of a mayor until 1467. Probably the town suffered at the hands of the French early in the 15th century, though in 1404 the men of Weymouth were victorious over a party which landed in the Isle of Portland. Commercial disputes with Melcombe led to amalgamation in 1571, and the town received its charter from James I. in 1616.

Melcombe Regis first returned two members to parliament in 1307, and Weymouth in 1319, four members being returned by the united boroughs until 1832, when the representation was reduced to two and ceased in 1885. The mediaeval fairs are no longer held. As early as 1293 trade was carried on with Bayonne, and six years later a receiver of customs on wool and wool-fells is mentioned at Weymouth, while wine was imported from Aquitaine. In 1586 sugar is mentioned as an import, and in 1646 deal boards were brought from Hamburg. The town suffered severely during the Civil War, being garrisoned by the parliamentary troops in 1642, taken by the earl of Carnarvon in 1643, and surrendered in the following year. The town is described as "but little" in 1733, but a few years afterwards it gained a reputation as a watering-place, and George III. in 1789 paid Weymouth the first of a series of visits which further ensured its popularity.

See H. J. Moule, *Descriptive Catalogue of the Charters, Minute Books, and other Documents of the Borough of Weymouth and Melcome Regis,* A.D. *1250 to 1860* (Weymouth, 1883); John Hutchins, *History and Antiquities of the County of Dorset* (3rd ed., Westminster, 1860).

WEYPRECHT, KARL (1838–81), German polar explorer, was born on Sept. 8, 1838, at König in Odenwald, Germany. In 1856 he became a cadet in the Austrian navy and in 1861 an officer. He made several voyages to the Orient and to America and spent two years on a coast-survey of Dalmatia. At his instance two expeditions were sent out to explore Novaya Zemlya and to attempt a northeast passage. That of 1871 reached 78° 48′ north. In 1872 the second got caught in the ice off Novaya Zemlya and drifted north and west for over a year. On Aug. 30, 1873, Weyprecht and his men caught sight of Franz Joseph Land, previously unknown. They wintered on one of the islands and spent the first half of the summer in 1874 making extensive explorations. In the autumn they returned to Novaya Zemlya, having spent almost three years in the Arctic. Weyprecht urged that scientific methods and investigation should dominate polar exploration and advocated a series of simultaneous, co-operative observations from polar observing stations. His plan was reported favorably by the International Meteorological Congress and studied by two successive international polar conferences held at Hamburg and Berne. As a result 15 expeditions were sent out by 11 countries, the historic Greeley expedition being one of the two financed by the United States. Weyprecht published *Die Metamorphosen des Polareises* (1879), and *Praktische Anleitung zur Beobachtung der Polarlichter und der magnetischen Erscheinungen in hohen Breiten* (1881). The best account of the Franz Joseph Land expedition is the translated account of his lieutenant J. Payer; *New Lands Within the Arctic Circle* (2 vol., 1876). Weyprecht died in Michelstadt on Mar. 29, 1881.

See also *Karl Weyprecht, Erinnerungen und Briefe* (1881).

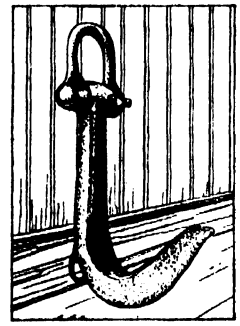
WEYR, RUDOLF VON (1847–). Austrian sculptor, was born on Mar. 22, 1847, at Vienna, and received his art education at the academy in his native city. He concerned himself most with decorative sculpture, chiefly in the revived rococo style. This he executed with great facility and rapidity, excelling especially in relief. His work perhaps shows no great depth of thought but does reveal an amazing faculty of decorative invention. Special mention should be made of the frieze of the Triumph of Bacchus in the Hofburg theatre, his Furies and Graces in the Raimund theatre, the frieze in the rotunda of the Art Museum of Vienna glorifying the Hapsburgs as patrons of art, decorations in the Natural History Museum, the reliefs from Grillparzer's dramas on his monument at the entrance of the Volksgarten, the fountain representing Naval Power on the façade of the Hofburg and his statue of the painter Hans Canon in the Stadt-Park.

WHALE: *see* CETACEA.

WHALEBONE, the inaccurate name under which the baleen plates of the right whale are popularly known; the trade-name of whale-fin, which the substance receives in commerce, is equally misleading. Whalebone is formed in the palate on the roof of the mouth and is an exaggeration of the ridges, often horny in character, which are found on the roof of the mouth of all mammals. Three kinds are recognized by traders—the Greenland, yielded by the Greenland whale, *Balaena mysticetus;* the South Sea, the produce of the Antarctic black whale, *B. australis;* and the Pacific or American, which is obtained from *B. japonica.* Of these the Greenland whalebone is the most valuable. It formed the only

staple known in earlier times, when the northern whale fishery was a great and productive industry. This whalebone usually comes into the market trimmed and clean, with the hairy fringe which edges the plates removed. To prepare whalebone for its economic applications, the blades or plates are boiled for about 12 hours, till the substance is quite soft, in which state it is cut either into narrow strips or into small bristle-like filaments, according to the use to which it is to be devoted.

Whalebone is light, flexible, tough and fibrous, and its fibres run parallel to each other without intertwisting. One of its earliest uses, referred to by William le Breton in the 13th century, was to form the plumes on helmets. Steel is now used for several purposes to which whalebone was formerly applied, especially in the umbrella and corset industries. Whalebone is, however, still in demand among dressmakers and milliners and for brushes for mechanical purposes, a use patented by Samuel Crackles in 1808.



When whalebone came into the English market in the 17th century it cost at first about £700 per ton. In the 18th century its price ranged from £350 to £500 per ton, but early in the 19th century it fell as low as £25. Later it varied from £200 to £250; but with the decrease in whaling the article has become very scarce, and upwards of £2,000 per ton has been paid for Greenland whalebone.

WHALE FISHERIES. The dangerous craft of whaling undoubtedly occurred in times too early for systematic record. The Eskimos traded the "bone" to the Greenland whalers, having apparently attacked the whales when they rose to breathe in the narrow water-lanes among the ice—a position the great whaling fleets of the Antarctic to-day find favourable for their operations. In the 9th century whaling was carried out by the Northmen, as is clear from Ochthere's account of his voyage, given to King Alfred; and according to a later statement it took place off the Flanders coast in the same century. Alfric, archbishop of Canterbury, mentions whaling in the 11th century, though it is not clear that he claims it as an English fishery. The Basques also made a very early start, and by the 13th century had made whaling an important industry. At first only whales approaching close to the shore were attacked—very possibly, in the first instance, only those which accidentally had stranded. Later, watch was kept from specially built towers, and on a whale being sighted near shore the men put out in boats to the attack, armed with harpoons and lances, killed the whale and towed it to shore. The whales becoming more inaccessible, either from lessening numbers or from increased wariness, or from both these causes, and the possibility of boiling down (or "trying out") the blubber on a ship having been demonstrated, ships of as much as 100 tons burden were built for whaling, ships of a specially seaworthy type, and the whalers went further afield. They reached Newfoundland waters, apparently, before the end of the 14th century, and later those of Greenland, where they took a different whale, evidently the right Greenland whale, *Balaena mysticetus*, and not the Biscay whale, *B. biscayensis* of their own coasts.

Early Whaling.—The next important whaling was that of Spitsbergen. The English were the first participants in the fishery, which arose from observations made in 1557 by voyagers of the Muscovy company. They were shortly followed by the Dutch, with whom they shared (and contested) the industry throughout the first part of the 17th century, though Biscayan, Danish and other ships took part. A whaler about the opening of this period was of 200 tons burden, with a crew of 55 men, and was provided with five pinnaces (for which 48 oars were carried). The whales, of which eight kinds are mentioned, were taken at first in the bays, and one of the reasons for the Dutch predominance, which was well developed by about 1650, was that when the whales disappeared from the coast they followed them along the ice more constantly than did the British ships. The boats carried 300 fathoms of rope for their "harping irons" or harpoons. On shore the boiling vats were built in, with a stokehold below. Extensive stations grew up in the islands; Smeerenburg or "Blubbertown," a Dutch station had bakeries, traders in spirits and tobacco, and a church, and was visited by a thousand whalers annually. Early in the 18th century the whaling had spread as far as Davis straits, and over 350 ships took part in it.

The Dutch predominance continued until the middle of the century, whose latter half witnessed a recrudescence of British whaling, assisted by bounties, which at first did much for American (then colonial) whaling also. Hull, Liverpool, Whitby, became whaling ports, and Leith, Dunbar and Dundee participated. The whaling vessels were of some 350 tons burden, carried 50 men and six whaleboats. They used to barrel the blubber for trying out on return; but later the Scottish brought it back in bulk in large tanks; the whalebone was brought whole, as was, for its oil, the jawbone. The rest of the carcase was abandoned. The high price of whalebone, reaching at times £500 per ton, was a material factor in the success of whaling during this period, particularly in America. The fishing was prosecuted vigorously; at times as many as 50 ships being in sight of one another on the grounds. Before the middle of the 19th century, however, it had begun to wane, owing apparently both to the growing scarcity of right whales and the use of substitutes for whale products, particularly of coal gas as an illuminant. Hull, the last English port for the Greenland grounds, ceased whaling in 1868; Dundee and Peterhead, owing in part to a strong local demand in the jute factories for whale oil, continued to a later date, but, in spite of the introduction of whalers with auxiliary steam power, and the capture of seals and other animals as well as whales, their fleets decreased and ultimately disappeared.

Whaling in the main Atlantic, the Pacific and the Antarctic was developed chiefly from the Newfoundland posts, Nantucket and Bedford in particular. Before 1700 the industry had passed through most of the coastal stages. Part was taken in the Greenland fishery, and from the capture of a sperm whale (*Physeter catodon*) offshore in 1712, American whaling spread down the whole length of the Atlantic, and before 1800 had reached the Pacific. The industry grew rapidly and was well established by the Revolution. Notwithstanding the vicissitudes of wars, from which American whaling suffered, perhaps, even more than did the European industry, a marked power of recovery was always shown. Shortly before 1850 the fleet numbered 680 sail in all; and all but 40 odd ships were employed in the Pacific in the pursuit of sperm and right whales. About the same date the right whales found in the neighbourhood of Bering strait, the bowheads, were hunted for the first time. The value attached to sperm oil, which was used for both ointments and candle making, had much to do with this development. A similar recovery followed the American Civil War; but the use of petroleum for lighting, and the more constant prospects offered to capital in other industries, caused American whaling to dwindle away. By 1900 the sperm whaling was nearly entirely dead, and the main whaling that of the small fleet following the bowhead. The grey whale, *Rhacinactes glaucus*, was also hunted in the lagoons of the western coast, but did not long endure the destruction. In the fisheries of the open sea mentioned above (all south of the Arctic) Great Britain took an active part. They were first in the Pacific and predominated for a time in the Indian ocean; their participation, however, began in 1775 and lasted less than a century. The hardships of these fisheries, known collectively as the Southern Whaling, must have been extreme. The ships were away three or more years and provisioned accordingly. Their crews must endure and work in tropical conditions, and in the rigorous climate of South Georgia and even of more southern latitudes. The attack by open boats (though usually four worked together) in mid ocean, with the added possibility of being towed out of sight of the mother ship, and the risk of fire in such whalers as tried out the blubber on board, must have made the calling hazardous in the extreme.

WHALES AND WHALING

1. School of whales feeding and spouting. The spouting is caused by forcing heated air from the lungs after long periods of holding breath
2. Whaling ship nearing a school of whales. Gunner preparing to fire harpoon gun. The harpoon has a pointed bombhead which explodes on impact. Wide barbs open with the explosion and hold harpoon firmly in flesh of whale
3. Whale "buoyed" for towing in. The carcass with seal birds swimming about it, has been inflated by forcing a sharp perforated steel tube into the stomach and pumping it full of steam and air. The company flag is planted in the body. This method is used only when the whale is to be taken to a shore factory
4. Towing home the catch. The dead whale, with flukes removed to prevent their wearing the vessel, has been made fast alongside
5. A second shot showing the explosive effect of the bomb attached to the harpoon head. In rough weather, three or more shots are often necessary before the whale is struck in a vital spot
6. A whale catcher. These ships, 90–140 tons burden, are seaworthy, easily handled and capable of making 15 knots per hour. The harpoon gun is mounted high on the fore-castle. The crow's nest for the look-out is unusually high. The ships are fitted with steam winches fixed to the bedplates in the forward hold where the whaling gear is stowed

WHALES AND WHALING

1. Right whale or whalebone whale being drawn on shore to flensing plane. This species yields true baleen (whalebone) and attains a length of 65 feet
2. Flensing a humpback whale, Durban, Natal. The humpback has black-and-white markings with white splotches on its under surface. The latter are probably scars left by barnacles and parasites. Large catches of this species are made in the Mozambique Channel and off the Cape of Good Hope
3. Flensers beginning to strip blubber from fin whale. The longitudinal slits are made with flensing knives and the blubber is then stripped off by means of steam winches
4. Cutting up whale carcasses after blubber has been stripped. The carcasses are used in the manufacture of oil and fertilizer, and in some countries, as Japan, for food. Blood of the whale is dried and used for fertilizer
5. View on board a floating blubber factory. Captured whales are stripped and dissected in the water and the pieces heaved on the deck of the ship where they are cut into smaller pieces for trying out
6. Westfold Whaling Station on South Georgia Island, which is the centre of the South Atlantic and Antarctic whale fisheries

whales, being taken near shore, were towed back to harbour for flensing and extraction of oil. The harpoon, which weighs over 100 lb., is some 4 ft. long. The cap contains an explosive and a time fuse, which sets it off three seconds after striking. The head behind the cap has four hinged 12 in. barbs, which open out in the body of the whale. The warp is attached to a ring, which is free to slide along a groove running nearly the whole length of the shank;

BY COURTESY OF OLD DARTMOUTH HISTORICAL SOCIETY AND WHALING MUSEUM

IMPLEMENTS USED IN WHALE FISHING. ABOVE, A BLUBBER FORK; CENTRE, DARTING GUN; BELOW, A HARPOON OF LATE TYPE WITH SWIVEL HEAD

when ready for use, the head, forepart of the shank and ring are in front of the gun-barrel, and the first part of the warp is coiled on a plate projecting over the ship's bows and immediately below the gun. A charge of 220 grammes of explosive such as ballisite or of black powder is used, in a cotton bag which is fastened to an hourglass-shaped wooden buffer, ended with rubber discs, and fitting the barrel. This buffer acts as tamping, and disappears on discharge. With the explosive named the barrel remains clean. The guns used are mostly muzzle loaders, though breech loaders are available. The range is usually 30 to 40 yards. The first discharge is sometimes immediately fatal, and slaughter is, in many cases, quicker than with the older methods.

The "catchers" have grown in size, power and speed. They can now, though not without difficulty, travel from the Cape to South Georgia under their own power. Essentially they are small steamers with fore-foot much cut away for facility in turning, with a high bow on which the gun is mounted, built with a pronounced flare to minimize the shipping of water at the gun. A first class boat will exceed 200 tons gross, and is about 130 ft. long. She has a powerful winch, and to reach it the warp passes from the bows over a sheave or pulley on the mast, which in turn is suspended by a warp which communicates with two powerful accumulator springs lying along the keel of the ship; excessive and sudden strain on the warp is in this way minimized. The main length of warp is not on the winch drums, but in bins on each side of the hold, from which it is paid out to them. A good catcher will have a speed of 14 knots and a complement of 11 men, under the gunner, who is also the master. Several catchers, usually from three to six, work in co-operation with one factory.

Factory Processes.—Parts of the tail flukes of the dead whale are removed to reduce resistance, and a chain is passed round the shank, by which the carcase is towed to the factory. Steam power is much used at the factory. By it the whale is drawn up the slope or ramp to the flensing stage. Here skilled flensers cut a V-shaped flap at the head, and secure in it a hook; a warp to which this is attached is then taken to a winch, by which a strip of blubber the whole length of the whale is peeled off. It is cut into "hook" pieces of some 20 kg., and dragged to the intakes of the boilers. After the blubber, the best of the meat is selected and removed (at such stations as the meat is utilized for food). The remainder of the carcase is then cut into pieces for the meat and bone boilers, steam saws being employed very largely. The material is more finely divided by revolving knives and, in some cases mincers, before boiling down. All modern boilers are pressure boilers, the heat being supplied by steam, usually at 65 lb. pressure, acting in closed vessels. The boiler is fitted internally with removable platforms, fitted gradually as it is filled. This prevents blocking, and provides channels for the steam and oil. Usually one boiler can give about 20 barrels of oil (3¾ tons) a day. A factory, however, possesses batteries of such boilers. There are various improved types, designed to speed up production or to economize fresh water, of which a great supply otherwise is necessary; the Hartmann plant, for instance, in which the material is inside a rotating horizontal cylinder pierced by sharply bevelled holes, can yield 150 barrels a day from mixed material, or 225 barrels from blubber. It should be added that extensive use is made of mechanical transport, the meat, etc., being raised in large hoppers working up inclined runners outside the factory to the level of the boiler top. All oil is now brought to post in bulk in large tanks. The material taken from the boilers after oil has been extracted is specially dried as whole meal or as guano. The most recent development is the use of large ships furnished with a ramp in the hull, usually at the stern, up which the whale can be drawn bodily for treatment. Such ships, if need be, work in the open sea, whereas the factory alongside which the whale is flensed must be in the shelter of shore or ice. Old Atlantic liners have been adapted for the work, and 17,000 tons burden is a not uncommon size. A vessel of 12,500 tons, to take an instance, is furnished with seven Hartmann boilers, one especially for bone and 12 ordinary boilers. With her three catchers, she has a complement of 180 men, and can deal with 12 whales a day. Shore stations are temporary settlements, with hospital, cinema, etc.

Products.—Whale meat is used in Japan. On Norwegian stations it is utilized fresh. Cut into 20 kg. blocks, it is refrigerated for shipment by special railway cars. It is sold at about half the price of beef. Only the best meat is used, but in a 50 ft. whale this will reach 2½ tons. Whalebone, though less valuable and in the whales now hunted less abundant, is still useful, that from the fin whale being used mainly for brushes. Oil, however, is the chief product of modern whaling. (*See* WHALE OIL.)

Ambergris, which is used as a fixative for perfumes, is found in a small percentage of sperm whales, and is a pathological product; it is never abundant, and is usually searched for owing to its great value. Whale meal is a valuable constituent of both cattle and chicken food, and whale guano has general utility as manure.

Spread and Extent of Modern Whaling.—The Svend Foyn gun was used first for whales off the Norwegian coast; and finnus (*Balaenoptera physalus*), bottlenose (*Hyperoodon rostratus*), and sei (*Balaenoptera borsalis*) are still taken there. Its use spread to Scottish and other waters, and in 1904 Capt. Larsen founded the first company for Antarctic whaling. This whaling rapidly grew to be the chief part of the industry. Norwegian, British and Argentine companies are at work, though the main part of the operations are in all cases carried out by Norwegian. The chief bases are in the dependencies of the Falkland Islands—South Georgia, South Orkneys, South Shetlands and South Sandwich, and these in recent years have (excluding Japan) accounted for nearly two-thirds of the world's productions. In the 1927–28 season, possibly owing to unusually favourable conditions due to ice distribution, whaling showed a tendency to spread from the more southerly stations along the ice edge; in that season the total production of these dependencies was 804,000 barrels, or 136,000 tons. Since 1925 the Ross sea has been laid under contribution.

The tendency to employ pelagic whalers, *i.e.*, those capable of embarking and treating the whale in the open ocean, is undoubtedly increasing, and great sums of money have already been invested in these craft. Apart from the Antarctic, they have been employed on the African coast, where the humpback (*Megaptera nodoza*) is the chief species taken. Evidently the extension of whaling far from land bases will greatly increase the destruction entailed, already immense. A large (89 ft.) blue whale (*Balaenoptera musculus*) may yield nearly 28 tons of oil, but this, though now the chief species hunted, is far above the average of even that large species; the catch probably represents over 12,000 whales.

Regulation.—It is natural that a destruction so rapid should awaken fears that the rate of destruction is greater than the stock of whales can replace. Whales breed slowly, the females giving birth to young (as a rule one only) probably once in two years at most. It has been said that the discovery of the Greenland whale alone saved the Biscay whale from extinction. The Norwegians, the greatest whaling nation, took in all seas 51,400 barrels of oil

in 1904; in 1927 they took 704,000 barrels. The need of some regulations is felt almost universally, and some are in force. The Falkland Islands Government prohibits the capture of right whales and, except by permit, of humpbacks. This and other Governments prohibit the shooting of calves and cow whales with calves. Many authorities insist on the total utilization of the carcase as far as practicable, and the Falklands permit whaling only under licences which prescribe the number of catchers to be employed. None of these regulations deal with operations in the open ocean.

About the year 1926, a well-equipped marine laboratory at South Georgia, the R.R.S. "Discovery," and a vessel ("William Scoresby"), specially built for marking whales for the purpose of tracing their movements began investigating these problems. A cruise to study conditions along the ice edge was projected by Christiansen of Sandefjord. Attempts are made at co-ordinating all results by a committee of the International Council for the Exploration of the Sea, which works in touch with the Economic committee of the League of Nations.

WHALE OIL. The oils derived from whales fall into two sharply defined classes: *Sperm oil,* obtained from the head cavity of the sperm whale or cachalot, *Physeter catodon,* and the oils obtained from the right whales (genus *Balaena*) and the rorquals (genera *Balaenoptera* and *Megaptera*). Sperm oil is not a true fatty oil, inasmuch as it usually contains only traces of glycerides; it consists mainly of fatty acids in combination with higher monohydric aliphatic alcohols, and is therefore included in the category of liquid waxes.

Sperm whales, when fully grown, may yield up to 145 barrels of oil each; on the average the cows yield about 25 barrels, and the bulls from 75 to 90 barrels (each barrel containing about 230lb. of oil). Large amounts of spermaceti are present in the crude oil, especially in that from the head, which is clear and liquid immediately after removal from the animal, but soon solidifies. In the refineries the oil is allowed to stand in refrigerators for several days at a temperature of 32° F. and pressed in hydraulic presses. The oil so obtained (about 75% of the crude) will not deposit stearine at 38° F. ("cold test"), and is known as *winter sperm oil.* Oils having a cold test of 32° F. have also been prepared, the yield being 67%. The press residues are twice re-pressed, first at a temperature of 50° to 60° F. yielding about 9% of *spring sperm oil* and secondly at 80° F., yielding a further 5% of oil. The press cake (about 11% of the crude oil) consists of crude spermaceti. Spermaceti, which consists principally of cetyl palmitate, also occurs in smaller proportions in the oils from other Cetacea. (For uses *see* SPERMACETI.)

Sperm Oil.—Sperm oil is a pale yellow oil with a slightly fishy smell: it may be recognized by the low specific gravity, 0·875 to 0·880, the low saponification value, 125 to 130, and the high proportion of unsaponifiable matter (about 40%).

Sperm oil is largely used for the lubrication of spindles and other light machinery. It is valued on account of its freedom from gumming tendencies, and also because the viscosity decreases less with increase of temperature than is the case with mineral oils.

Arctic sperm oil, a kindred oil closely resembling sperm oil in its constitution, is obtained from the bottlenose whale, *Hyperoödon rostratus.* Each animal yields about eight barrels of the oil, which has a distinctly lower value than true sperm oil, owing to its more pronounced tendency to gum.

The oil obtained from the blubber, that is, the layer of fat immediately beneath the skin, from all species of whales other than the two mentioned above, is a true fatty oil, consisting almost entirely of glycerides. It was formerly known as "train oil" (German "Tran"). The amount of oil obtainable from the fully-grown animal varies with the species, as is shown in the following table:—

Whale	Yield in barrels of 31·5 gallons
Right whale, Pacific	25 to 250
" " Atlantic	25 " 150
Humpback whale, Pacific	10 " 110
" " Atlantic	10 " 100
Finback whale, Pacific	10 " 70
" " Atlantic	20 " 60
Californian grey whale	15 " 60
Orca or killer whale	1 " 6
Beluga or white whale	1 " 3

Treating the Blubber.—The "sulphur-bottom" whale is stated to yield 6 tons of oil, 3½ tons of guano and 3 cwt. of whalebone. The first quality oil is that yielded by the right whale, the "southern oil" being of lower quality. The "finner whale oil" is a still lower grade. Some whalers still "try" the blubber on board ship, although this practice has been almost superseded by the modern procedure of rendering the blubber in central stations on shore. In these stations the blubber is stripped clean from every particle of flesh as soon as possible after the capture of the whale, and cut into strips, which are then further divided in chopping machines. The mass is then placed in large pans and boiled with open steam. The oil which first runs off varies in colour from pale yellow to almost water-white. This oil has a very slight fishy smell and is known as "whale oil No. 0." "Whale oil No. 1," the oil obtained on further boiling the comminuted mass, is slightly darker in colour and possesses a more pronounced odour. These two oils are stored in large vessels in the cold, and the deposited stearine or "whale tallow" (consisting largely of palmitin) is removed by pressing in a hydraulic press. After removal of oil No. 1, the mass is subjected to steam in digesters at a pressure of from 40 to 50lb. per sq.in., whereby "whale oil No. 2" is obtained, which is brown in colour with a strong odour. A still darker oil, "whale oil No. 3," is obtained by adding the flesh, cut into rough lumps, together with the bones, and again digesting under steam pressure. Finally, "whale oil No 4" ("carcase oil") is obtained after the mass has putrefied; in some cases the bones are worked up separately, yielding "Whale Bone Oil." The better qualities of oil contain only small amounts of free fatty acids, and can be bleached by treatment with fuller's earth. The lower qualities of oil, however, may contain upwards of 50% of free fatty acids, and cannot always be bleached successfully. In common with other marine oils, whale oil contains considerable amounts of highly unsaturated fatty acids, including members of the clupanodonic acid group, in which the molecule contains four pairs of doubly-linked carbon atoms.

It has yet to be seen whether blubber oils contain, as do cod-liver and some fish body oils, any notable proportion of the fat-soluble vitamins.

The best quality whale oils are used as burning oils and for soap-making. When the margin of price between liquid and solid fats permits, large quantities of pale whale oil are hydrogenated (hardened), producing a white tallow-like fat suitable for edible purposes. Whale oil is also used for batching jute and other vegetable fibres, for quenching steel plates and for leather-dressing. It figures as an ingredient of lubricants for screw-cutting machines. The magnitude of the whaling industry may be gauged from the following figures: for the years 1925 and 1926 the production of whale oil was 1,072,000 and 1,120,000 barrels respectively. The United Kingdom imported nearly 51,000 tons in 1926. (*See* also OILS AND FATS.) (E. L.; G. H. W.)

WHALLEY, EDWARD (*c.* 1615–*c.* 1675), English regicide, was the second son of Richard Whalley, who had been sheriff of Nottinghamshire in 1595, by his second wife Frances

Cromwell, aunt of Oliver Cromwell. On the outbreak of the Civil War he took up arms for the parliament, became major of Cromwell's regiment of horse, and fought with distinction in the campaigns of 1643 to 1647. When the king was seized by the army, he was entrusted to the keeping of Whalley and his regiment at Hampton Court. Whalley refused to remove Charles's chaplains at the bidding of the parliamentary commissioners, and treated his captive with due courtesy, receiving from Charles after his flight a friendly letter of thanks. In the second Civil War, Whalley again distinguished himself as a soldier, and when the king was brought to trial he was chosen to be one of the tribunal and signed his death-warrant. He took part in Cromwell's Scottish expedition, was wounded at Dunbar, and in the autumn of 1650 was active in dealing with the situation in north Britain. Next year he took part in Cromwell's pursuit of Charles II. and was in the fight at Worcester. He followed and supported his great kinsman in his political career, presented the army petition to parliament (August 1652), approved of the protectorate, and represented Nottinghamshire in the parliaments of 1654 and 1656, taking an active part in the prosecution of the Quaker James Naylor. He was one of the administrative major-generals, and was responsible for Lincoln, Nottingham, Derby, Warwick and Leicester. He supported the "Petition and Advice," except as regards the proposed assumption of the royal title by Cromwell, and became a member of the newly constituted House of Lords in December 1657. On the Protector's death, at which he was present, he in vain gave his support to Richard; his regiment refused to obey his orders, and the Long Parliament dismissed him from his command as a representative of the army. In November 1659 he undertook an unsuccessful mission to Scotland to arrange terms with Monk. At the Restoration, Whalley, with his son-in-law, General William Goffe, escaped to America, and landed at Boston on July 27, 1660, living successively at New Haven and at Hadley, Massachusetts, the government at home failing to procure his arrest.

AUTHORITIES.—An account of Whalley's life is in Mark Noble's *Lives of the English Regicides*, and also of his family in Noble's *Memoirs of the Protectoral House of Cromwell*, vol. ii. (1787, 2nd ed.); *see* besides Gardiner's and Clarendon's histories of the period; Peck's *Desiderata curiosa* (1779; Whalley's account of the king's flight); Ezra Stiles's *History of three of the Judges of Charles I.* (1794, etc.). The article by C. H. Firth in the *Dict. Nat. Biog.* is an admirable summary. Whalley's sojourn in America is dealt with in numerous papers published by the Massachusetts Historical Society, and in the Hutchinson Papers published (1865) by the Prince Society; *see* also *Atlantic Monthly*, vi. 89–93; *Pennsylvania Mag.*, i. 55–66, 230, 359; F. B. Dexter's Memoranda concerning Whalley and Goffe, *New Haven Col. Hist. Soc. Papers*, ii. (1877); *Poem commemorative of Goffe, Whalley and Dixwell*, with abstract of their history, by Philagathos (Boston, 1793); Palfrey's *Hist. of New England*, ii. (1866); *Notes and Queries*, 5th series, viii. 359 (bibliography of American works on the regicides).

WHARTON (FAMILY). The Whartons of Wharton were an old north of England family, and in 1543 THOMAS WHARTON (1495–1568) was created a baron. The fifth baron, THOMAS WHARTON (1648–1715), was created in 1706 earl and in 1714 marquess of Wharton. The 1st marquess is famous as the author of the political ballad, *Lilliburlero*, which "sang James II. out of three kingdoms." Wharton was lord-lieutenant of Ireland in Anne's reign, and incurred the wrath of Swift, who attacked him as Verres in the *Examiner* (No. 14), and drew a separate "character" of him, which is one of Swift's masterpieces. Addison dedicated to him the fifth volume of the *Spectator*, giving him a very different "character" from Swift's. His first wife, ANNA WHARTON (1632–1685), was an authoress, whose poems, including an *Elegy on Lord Rochester*, were celebrated by Walter and Dryden. His son, PHILIP WHARTON (1698–1731), duke of Wharton, succeeded to his father's marquessate and fortune, and in 1718 was created a duke. But he earned for himself, by his profligacy and reckless playing at politics, Pope's satire of him as "the scorn and wonder of our days" (*Moral Essays*, i. 179). After spending his large estates he went abroad and gave eccentric support to the Old Pretender. He was outlawed in 1729, and at his death the titles became extinct.

For the history of the family *see* E. R. Wharton's *Whartons of Wharton Hall* (1898).

WHARTON, EDITH NEWBOLD (1862–), American writer, the daughter of George and Lucretia Jones, was born in New York city, and was educated at home, but spent most of her later life in Italy and France. In 1885 she married Edward Wharton, a Boston banker, and a few years later she began her literary career by contributing poems and short stories to *Scribner's Magazine*. The *House of Mirth* (1905) definitely established her reputation. The very brief novel *Ethan Frome* (1911) is comparable only to the work of Hawthorne in the grimness of its tragedy of New England love and frustration. Her splendid sense of character, her cutting irony, her technique—in which she shows a decided kinship to Henry James—have secured for her a high place in American literature. Mrs. Wharton's long residence in Europe has caused her to write a number of books of travel, such as *Italian Villas and Their Gardens* (1904), but her reputation rests chiefly on her novels and short stories. Among these are: *Crucial Instances* (1901); *The Fruit of the Tree* (1907); *Xingu and Other Stories* (1916); *The Age of Innocence* (1920); *A Son at the Front* (1923); the four volumes portraying the life of old New York: *False Dawn*, a story of the '40s, *The Old Maid*, the '50s, *The Spark*, the '60s, and *New Year's Day*, the '70s, published together in 1924; *Twilight Sleep*, a novel (1927), and *The Children*, a novel (1928). She discusses her own method and point of view in *The Writing of Fiction* (1925).

See L. M. Melish, *Bibliography of the Collected Writings of Edith Wharton* (1927) and R. M. Lovett, *Edith Wharton* (1925).

WHARTON, FRANCIS (1820–1889), American legal writer and educationist, was born in Philadelphia, Penn., March 7, 1820. After holding various professional and ecclesiastical posts, he settled in Washington, D.C., where in 1885–88 he was lecturer and professor of criminal law at Columbian (now George Washington) university and solicitor of the Department of State. Wharton wrote many legal treatises and was a leading American authority on international law. He died in Washington, D.C., Feb. 21, 1889.

See the *Memoir* (Philadelphia, 1891) by his daughter, Mrs. Viele, and several friends; and J. B. Moore's "Brief Sketch of the Life of Francis Wharton," prefaced to the first volume of the *Revolutionary Diplomatic Correspondence;* Asa W. Russell, "Francis Wharton, L.L.D., D.D., Lawyer, Publicist, Editor, Professor, Author and Clergyman," *Case and Comment*, vol. 18 (1911).

WHARTON, HENRY (1664–1695), English writer, was descended from Thomas, 2nd Baron Wharton (1520–1572), born at Worstead on Nov. 9, 1664, studied at Gonville and Caius college, Cambridge. In 1687 he was ordained deacon, and Sancroft, archbishop of Canterbury, made him one of his chaplains and appointed him in succession to two Kentish livings. He died on March 5, 1695, and was buried in Westminster abbey.

Wharton's most valuable work is his *Anglia sacra*, a collection of the lives of English archbishops and bishops, which was published in two volumes in 1691. In the Lambeth library there are 16 volumes of Wharton's manuscripts. A life of Wharton is included in George D'Oyly's *Life of W. Sancroft* (1821).

WHATELY, RICHARD (1787–1863), English logician and theological writer, archbishop of Dublin, was born in London on Feb. 1, 1787. He was educated at a private school near Bristol, and at Oriel College, Oxford. In 1811 he was elected fellow of Oriel, and in 1814 took orders. During his residence at Oxford he wrote his *Historic Doubts relative to Napoleon Bonaparte*, a very clever *jeu d'esprit* directed against excessive scepticism as applied to the Gospel history. After his marriage in 1821 he settled in Oxford, and in 1822 was appointed Bampton lecturer. The lectures, *On the Use and Abuse of Party Spirit in Matters of Religion*, were published in the same year. In August 1823 he removed to Halesworth in Suffolk, but in 1825, having been appointed principal of St. Alban Hall, he returned to Oxford. His treatise on *Logic* (1826), originally contributed to the *Encyclopaedia Metropolitana*, gave a great impetus to the study of logic throughout Great Britain. A similar treatise on *Rhetoric*, also contributed to the *Encyclopaedia*, appeared in 1828. In 1829 Whately became professor of political economy at Oxford, but lectured only for two years, as he was appointed archbishop of Dublin in 1831. One of his first acts was to endow a chair of

political economy in Trinity College out of his private purse.

In 1837 he wrote his well-known handbook of *Christian Evidences,* which was translated during his lifetime into more than a dozen languages. At a later period he also wrote, in a similar form, *Easy Lessons on Reasoning,* on *Morals,* on *Mind* and on the *British Constitution.* Among his other works may be mentioned *Charges and Tracts* (1836), *Essays on Some of the Dangers to Christian Faith* (1839), *The Kingdom of Christ* (1841). He also edited Bacon's *Essays,* Paley's *Evidences* and Paley's *Moral Philosophy.* His cherished scheme of unsectarian religious instruction was defeated by the opposition of the new Catholic archbishop of Dublin, and Whately felt himself constrained to withdraw from the Education Board. From the beginning Whately was a keen-sighted observer of the condition of Ireland question, and gave much offence by openly supporting the state endowment of the Catholic clergy as a measure of justice. During the terrible years of 1846 and 1847 the archbishop and his family were unwearied in their efforts to alleviate the miseries of the people. Whately died on Oct. 8, 1863.

Whately may be said to have continued the typical Christianity of the 18th century—that of the theologians who went out to fight the Rationalists with their own weapons. It was to Whately essentially a belief in certain matters of fact, to be accepted or rejected after an examination of "evidences." Hence his endeavour always is to convince the logical faculty, and his Christianity inevitably appears as a thing of the intellect rather than of the heart. Whately's qualities are exhibited at their best in his *Logic,* which is, as it were, the quintessence of the views which he afterwards applied to different subjects. He wrote nothing better than the luminous Appendix to the work on *Ambiguous Terms.*

In 1864 his daughter published *Miscellaneous Remains* from his commonplace book and in 1866 his *Life and Correspondence* in two volumes. The *Anecdotal Memoirs of Archbishop Whately,* by W. J. Fitzpatrick (1864), enliven the picture.

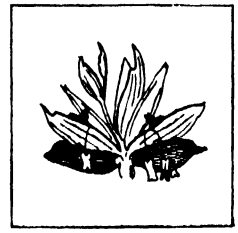
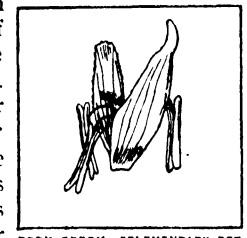
WHEAT. Among the three or four most important cereals utilized as food by man wheat (*Triticum*) occupies the first place. It is the cereal above all others from which good bread can be made and in this form is consumed by the most highly civilized nations of the world.



FROM GROOM, "ELEMENTARY BOTANY" (G. BELL & SONS)

FIG. 1.—INFLORESCENCE OF WHEAT

The grain from which the plant is grown is a caryopsis or nut-like fruit containing a single seed. The thin shell or pericarp of the fruit and the coat of the seed are so closely united when ripe that they cannot be separated. The colour of the grain is usually a pale creamy tint or some shade of red but in certain Abyssinian wheats it is purple. The surface is smooth except at the tip which is covered with hairs; the dorsal side is convex, the ventral side having a longitudinal furrow. At the base of the grain on the dorsal side is an oval wrinkled patch which covers the embryo of the seed. The embryo possesses several rudimentary rootlets and a terminal bud, or plumule, from which the stem and leaves of the future plant develop. Its position, relative size and parts, as well as the structure of the rest of the grain are shown in the longitudinal section given in fig. 2. Beneath the epidermis are a few layers of cells belonging to the pericarp; within these is the seed coat which surrounds the embryo and the endosperm or floury part of the seed. The outer layer of the endosperm consists of cubical cells containing minute aleuron grains composed of protems. The rest, which makes up the bulk of the endosperm, is a mass of thin-walled cells within which are vast numbers of starch grains imbedded in a matrix of proteins from which the gluten so essential to the manufacture of good porous bread is derived.



Life-history.—Germination of the grain occurs in a few days when sown in warm soil; the rootlets, breaking out first, are soon followed by the plumule leaves. The main axis or stem extends a little and the lateral buds upon it grow into short stems upon which buds also arise, and these in turn produce short stems and buds; such branching of the young plant, termed "tillering," which occurs close to the ground, continues for a variable length of time dependent on the variety of the wheat, the time of sowing, condition of the soil and other factors. The many short stems produced are at first hidden by the leaves; later they rapidly elongate or "shoot" upwards forming the straws of the crop. The much branched axis of a strongly "tillered" plant may thus give rise to 5, 10, 20 or even 100 straws and ears, all of which have come from the embryo of a single grain.

FROM GROOM, "ELEMENTARY BOTANY" (G. BELL & SONS)

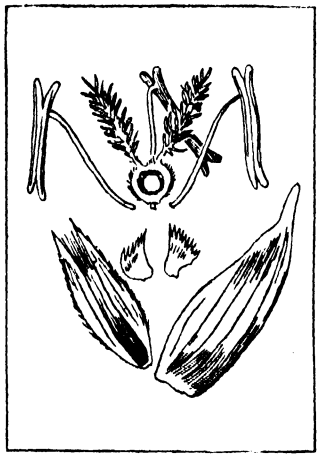
FIG. 2.—A SPIKELET OF WHEAT

The inflorescence or ear of wheat consists of a notched axis or rachis which bears on alternate sides from 18–25 flattened spikelets, one at each notch. Each spikelet has a thin central axis—the rachilla. At the base are two boat-shaped chaffy scales, the empty glumes; then follow a number of flowers arranged alternately along the rachilla, each enclosed between a flowering glume and palea, the former of which may or may not terminate in a long beard or awn. The flower is very simple, consisting of three stamens and a feathery-styled ovary, at the base of which are two minute membranous scales termed lodicules. The number of flowers in a spikelet varies in different races of wheat, but in ordinary bread wheat is 4–6 or more, of which usually not more than two or three develop into grain, the rest being abortive.

FROM GROOM, "ELEMENTARY BOTANY" (G. BELL & SONS)

FIG. 3.—FLOWER OF WHEAT

After the ear escapes from the upper leaf sheath flowering takes place in five or six days, when the glumes surrounding the flowers are pushed apart by the lodicules which swell and become turgid at this period. The filaments of the flower lengthen rapidly and the anthers dehisce at their tips. Some of the abundant pollen falls on the feathery stigmas, often before the flower opens, the rest being shed into the air. Normally the glumes remain separated about 15–20 minutes and then close; self-pollination and self-fertilization is the rule, but crossing from pollen brought to the flower by air currents before the glumes close is common in warm climates and not infrequent in Britain in some seasons. Flowering goes on throughout the day. The lowest flower of each spikelet opens first, the rest following in succession upwards. The first spikelet to flower lies in the middle third of the ear, and flowering progresses upwards and downwards from this point, the last to open being those of the terminal and basal spikelets respectively. The whole ear completes its flowering in five or six days in warm weather, but is prolonged to six or eight days when the sky is overcast.

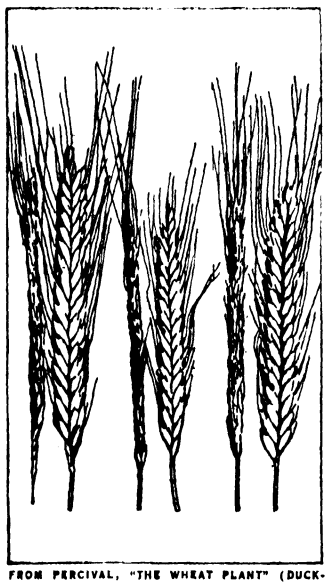


FROM GROOM, "ELEMENTARY BOTANY" (G. BELL & SONS)

FIG. 4.—DIAGRAM OF FLOWER

After fertilization the grain begins to develop, its volume increasing day by day. The pericarp expands as the seed within enlarges, and reaches its maximum size in four or five weeks, when the water content is about 70% of the weight of the grain. Later the dry weight increases, the water content gradually decreasing to 12–14% when the grain is ripe. At the time of maximum volume the grain is green, the embryo almost completely formed and the cells of the endosperm contain a large amount of water. At this stage the grain is said to be "milk ripe;" on squeezing it yields a white liquid in which float vast numbers of starch grains. In the "yellow ripe" stage which follows, the grain has assumed its creamy or reddish tint,—the chlorophyll of the cells of the pericarp having disappeared,—and the endosperm now kneads like

wax or dough. In two or three days the "ripe" stage is reached when the characteristic colour of the grain is clearly marked, its endosperm becomes harder and the flinty or mealy character is established.

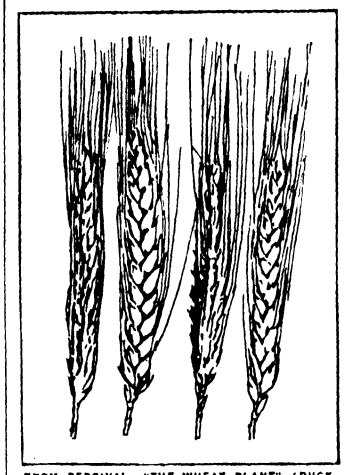


The time taken in the ripening process depends on the variety of the wheat, and the climate of the locality in which it is grown; in the south of England the time elapsing between the date of appearance of the ear from the leaf-sheath and the production of ripe grain is from 8–9 weeks for most wheats.

FROM GROOM, "ELEMENTARY BOTANY" (G. BELL & SONS)

FIG. 5.—DISSECTED PART OF FLOWER

Species and Races. — The classification of the vast number of forms of wheat presents numerous difficulties, and many attempts have been made by botanists since the time of Linnaeus (1753) who recognized five species. Most of these schemes are based upon differences in the morphology of the ear, and the majority refer to a comparatively few of the known forms and these chiefly herbarium specimens. The most comprehensive classification based upon the study of living plants of practically all known kinds growing under similar conditions is that given in Professor Percival's monograph, *The Wheat Plant*. In this work are recognized eleven cultivated species or races, which fall into three groups as follows:—Group I. Einkorn (*Triticum monococcum* L.). Group II. Emmer (*T. dicoccum* Schüb.); Macaroni wheat (*T. durum* Desf.); Rivet wheat (*T. turgidum* L.); Egyptian Cone wheat (*T. pyramidale* Perciv.); Khorasan wheat (*T. orientale* Perciv.); Polish wheat (*T. polonicum* L.). Group III. Bread wheat (*T. vulgare* Host.); Club wheat (*T. compactum* Host.); Indian Dwarf wheat (*T. sphaerococcum* Perciv.); Spelt or Dinkel (*T. Spelta* L.). The chromosome number of the wheats of group I. is 14, that of group II. is 28, while that of group III. is 42.



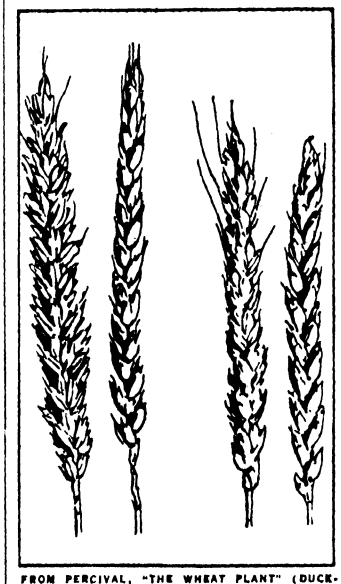
FROM PERCIVAL, "THE WHEAT PLANT" (DUCKWORTH)

FIG. 6.—SMALL SPELT

Einkorn (German, one grain); *Engrain* (French; Small spelt). The wheats of this race have bearded, thin flat ears from 5–9 cm. long. The spikelets generally contain only a single grain. The rachis of the ear when ripe is brittle and disarticulates at each node or joint when thrashed. The grains are small, laterally compressed and pointed at each end. It is an ancient race cultivated only by primitive peoples in Europe, Asia Minor and Morocco, and chiefly used as food for cattle and horses.

Emmer.—The ears of this race are bearded and flattened, the spikelets containing two grains which are narrow and generally pointed at each end. In the typical Emmer the rachis is brittle, and the grain firmly held between the sharply keeled glumes can only be obtained free from the latter with difficulty. Archaeological evidence shows that Emmer is one of the most ancient of the wheats; it was extensively grown by Neolithic peoples of Central Europe and was the only wheat cultivated in Egypt in predynastic and early dynastic times. At present it is grown for human food by primitive races in India, Persia, the Caucasus, Abyssinia and Morocco, and a small quantity in South Germany and the Basque districts of Spain. Small amounts are also grown in other parts of the world for horse and cattle food.

Macaroni wheats are tall solid-strawed kinds with bearded ears and sharply keeled glumes. The grain is narrow, pointed at each end, with hard translucent endosperm specially suitable for the manufacture of macaroni and other similar pastes. These wheats have glabrous leaves and resist drought well, giving good crops of grain in districts with a low rainfall. They are cultivated throughout the Mediterranean region, in Central Asia, India, South Africa and the warmer regions of North and South America.



FROM PERCIVAL, "THE WHEAT PLANT" (DUCKWORTH)

FIG. 7.—MACARONI WHEAT

Rivet or *Cone* wheats are tall solid-strawed forms with heavy, bearded ears, sharply keeled glumes and large, plump, blunt-tipped grains with a characteristic dorsal hump. The endosperm of of the grain is soft and starchy, more suited to the biscuit-maker than the baker of bread. Some varieties of rivet, often named mummy, miracle or seven-headed wheats, have branched ears. The rivet wheats have soft, velvety leaves and require a warm climate for full development. They are grown chiefly in countries along the northern side of the Mediterranean from Portugal to the Caucasus, though small amounts of some varieties are met with in the warm parts of other countries.

In addition to the three races of wheat mentioned above and belonging to the Emmer group, are three comparatively small uncommon races, viz.—Egyptian cone, Polish and Khorasan wheats.

The *Egyptian cone wheats* are endemic in Egypt; they resemble the rivet wheats in their velvety leaves, and dorsally-humped grain, but have short straw, comparatively short dense ears and are early.

FROM PERCIVAL, "THE WHEAT PLANT" (DUCKWORTH)

FIG. 8.—BREAD WHEAT

Polish wheat is a tall-strawed kind endemic in Spain and sporadically found in other countries along the Mediterranean; the origin of the name Polish is obscure. The empty glumes are of extraordinary length (1–1½ in.); the grains of the common varieties which are very long and narrow, are used for the manufacture of macaroni. Some Abyssinian forms have short grains somewhat like those of Emmer wheats with which they appear to have relationship.

Khorasan wheat is a small race found only in limited amounts in Khorasan and parts of 'Iraq and Egypt. The ears are bearded and lax, with elongated, sharply keeled empty glumes and long narrow grain.

Bread Wheat.—This is by far the most important and most widely distributed race of wheats; included in it are all the kinds from which the bread supply of the world is derived. Both bearded and beardless varieties are found and among the many hundreds of forms which are known there is seen the greatest variation in length and density of ear, form of empty glume, habit of growth, period of ripening, resistance to disease, adaptability to various climatic conditions, and cropping capacity. The gluten of the flour of these wheats is superior to that of all other

races in the physical qualities upon which the manufacture of a large spongy loaf depends. So far as the bread-making qualities are concerned millers and bakers divide wheat into "strong" and "weak" varieties. To the former belong those in which the gluten is highly elastic, the bread made from them being especially porous and digestible; similar amounts of flour of "weak" wheats give smaller, denser and less easily digested loaves.

The great bread wheat countries are the United States, Canada, Russia, Argentina, India and Australia, but larger or smaller amounts are grown in all countries wherever wheats of any race can be cultivated.

Club Wheat.—This race is closely related to the preceding, resembling it in grain qualities and general morphological characters. The chief differences are seen in the ears which are very short—often not more than two inches in length—with densely packed spikelets. Club wheats are widely distributed in mixture with the bread wheats, pure crops of them being uncommon except in Central Asia, China and the northern Pacific States of America.

Indian Dwarf Wheat.—A remarkable race of few varieties, sometimes erroneously classified with the club wheats from which they are quite distinct. The straw is short and stiff, and the ears dense with inflated empty glumes in which are enclosed small round grains. These wheats are almost entirely confined to northern India, where they are found to resist drought well.

Spelt or Dinkel.—The term "spelt" has unfortunately been employed in two different senses by botanists. It is given to all wheats in which the ear has a brittle rachis; in this sense it includes Einkorn, Emmer and Dinkel as well as the wild wheats mentioned below. It is also applied in a special sense to the Dinkel race alone (*T. Spelta*).

Typical Dinkel or Spelt (German, *Spelz*) has long lax ears, which may be bearded or beardless. On thrashing, the rachis breaks at the nodes, a single spikelet remaining attached to each internodal portion of the rachis. The spikelets usually contain two grains tightly enclosed in the glumes from which they can only be freed by special milling machinery. The empty glumes are tough, keeled and have a broad truncate apex.

Dinkel is a hardy wheat grown chiefly in south Germany, the Tyrol, parts of Switzerland and northern Spain. The naked grains are used in soups and to a lesser extent ground into flour for confectionery.

Origin of the Wheats.—The cultivation of one race or another of wheat extends far back into prehistoric times. In the earliest historic periods wheat growing was already an ancient industry and the origin of the crop a matter of tradition only. Obscurity still prevails and the ancestry of many of the races of wheat remains problematical. There is, however, no doubt that the cultivated Einkorn has been derived from *Triticum aegilopoides* Bal., a wild species of grass found in hilly districts in south-eastern Europe and Asia Minor; the differences between the cultivated and wild plants are very small and their botanical relationships obvious.

The brittle-eared emmer closely resembles *Triticum dicoccoides* Körn, a wild species of wheat found in the mountainous parts of Syria, and has doubtless descended from it. The other wheats of the emmer group have probably arisen by mutation and crossing within the group.

It is in regard to the origin of the wheats of the bread wheat group that the greatest obscurity and uncertainty exists, and no plant has yet been discovered which resembles any of these wheats. Some botanists have suggested that the wild ancestor has become extinct, others hope that it may possibly be found by further search in south-western Asia. From a prolonged study of many hundreds of forms Professor Percival concludes that the bread wheat group with its vast number of varieties has arisen by hybridization of a wheat of the emmer group with *Aegilops ovata* and *A. cylindrica*, two wild species of grass found in southern and eastern Europe and western Asia. Both these cross readily with emmer and bread wheats, and although the hybrids are usually sterile a few fertile hybrids have been obtained.

From very early times attempts have been made to improve the wheat crop, either in yield, quality of grain, earliness, disease resistance or some other desirable character. Among the ancient Romans mass selection was practised, a number of the best ears or largest grains being chosen annually from the crops and the produce used as seed for the succeeding crop; in this manner a high average yield was maintained.

Some of the world's most famous improved wheats have been selections of single ears or plants exhibiting superior characters, such individuals being picked out of an ordinary crop, or found growing casually on roadsides, in hedges, or among other crops on cultivated ground.

Hybridization has also been practised with a view of obtaining improved wheats. At first crossing was carried out in order to secure a greatly varying offspring, from which it was hoped to select plants of superior merit. Since the discovery by Mendel of the laws of inheritance (*see* HEREDITY, MENDELISM), interest in hybridization has been greatly stimulated, and in all wheat-growing countries the crossing of wheats is being extensively pursued, the aim being to combine in one plant the good qualities found in two or more separate individuals. The most important character from the point of view of the farmer is total yield of grain, a hereditary quality largely influenced by environment. Attempts to combine this character with earliness, baking quality, winter hardiness, disease resistance and other desirable qualities have been only partially successful.

Wheat is one of the most widely distributed of the cereals, and is grown in almost all countries of the world, except those in the hot and humid regions of the tropics. The great areas from which the world's supplies of wheat are derived lie in the northern hemisphere between 30–60 N. latitude, but crops are grown near the equator in the mountainous parts of Africa and South America, and their cultivation extends as far north as the Arctic Circle, or slightly beyond it in certain parts of Europe, Asia and North America.

Wheat may be grown at sea level or at elevations up to 10,000 feet or more in Tibet, Abyssinia and the highlands of Ecuador and Colombia.

Some varieties will withstand a temperature of 20 C below freezing point without injury, if the plants are protected by a covering of snow. In countries with severe winters spring kinds are cultivated; the more prolific autumn sown varieties of western Europe being only adapted to districts with comparatively mild winters.

Wheat will thrive in almost any kind of soil except dry sands and wet peaty soils; it succeeds best, however, upon deep, well drained loams and clays.

The yield of grain per acre depends on a number of independent factors, such as the variety of wheat, climate and soil, time of sowing, amount of seed and other conditions, the maximum return being only obtained when all the conditions named are favourable and exerting their influence simultaneously—an extremely rare occurrence. In ordinary farm practice the yield of grain varies from about 10–20 bushels (600–720 lb.) in the warm countries of southern Europe, North Africa, Argentina, India and Australia, to 30 or 40 bushels (1,800–2,400 lb.) per acre in the United Kingdom and the adjacent countries of north-western Europe. The average yields of the United States and Canada is about 15–20 bushels (900–1,200 lb.) per acre. In exceptional circumstances small areas of a few acres in extent have given up to 100 bushels (6,000 lb.) per acre.

Diseases and Parasites.—Like other crops, wheat is subject to the attacks of parasitic fungi which cause diseases. Among those most feared by the wheat grower is the disease known as black stem rust, annual losses from which amount to many millions of pounds.

In early summer are seen narrow elongated rust coloured pustules on the stems and leaves; these are the sori of the rust fungus, *Puccinia graminis*, from which are shed vast numbers of reddish-yellow uredospores. When placed on the leaf or stem of the wheat plant the spores germinate and penetrate its tissues giving rise in a short time to another sorus; in this manner the disease is spread rapidly through the crop during summer. Later

in the season the sori are almost black, producing dark-brown teleutospores which do not germinate until the following spring, when they give rise to small secondary spores; these cannot infect wheat but readily attack the leaves of the barberry (*Berberis vulgaris*). Within the leaves of the new host the fungus grows and bears aecidia or cluster-cups, which break through the epidermis and shed large numbers of aecidiospores; the latter are unable to re-infect the barberry, but when carried to a wheat plant germinate and penetrate the young leaves producing there an internal mycelium from which uredospores like those first mentioned are given off.

Several biological species of the black stem rust fungus are known, which though similar in morphological characters are different in their parasitism. One biological species attacks wheat, barley, rye and several wild grasses; another is parasitic only on oats and certain grasses, a third lives upon rye and barley and will not infect wheat or oats, while three or four are only capable of using certain grasses as hosts.

In districts or countries from which barberry is absent successive crops of wheat are often very seriously infected with rust; the explanation usually given for the prevalence of the disease under these circumstances is that the parasite persists from one season to another in the uredo stage upon stray wheat plants or wild grasses. There is still, however, considerable obscurity regarding the origin of attacks of black stem rust in barberry-free regions.

No specific remedies for rust diseases are known, but black stem rust is less prevalent in areas from which the barberry host has been eradicated. Varieties of wheat differ considerably in their susceptibility to these parasites, and it is hoped that by selection of immune kinds or the production of resistant hybrids, the damage to crops may be checked or largely reduced.

Another disease of serious import to the wheat grower is bunt or stinking smut, *Tilletia tritici*. Bunted grains produced by diseased plants have a disagreeable odour of decaying fish, and are filled with a mass of black spores which are set free during the threshing process, becoming attached to the coats of the healthy grains. Germination of the bunt spores and the contaminated grains occur at the same time when sown, and the fungus infects the young plant soon after it makes its exit from the grain. The parasite lives in the wheat plant without seriously affecting its growth, progressing upwards in the stem and finally entering the developing grain where the mycelium of the fungus is transformed into a mass of bunt spores. The disease can be checked by steeping the seed grain in solutions of copper sulphate, formalin or other fungicides which destroy the spores on the contaminated grains without damaging the embryos within them.

Allied to bunt is common smut of wheat, *Ustilago tritici*, a parasite having a life-history similar to that of bunt, but it gains an entrance into its host through the flowers.

For further knowledge consult *The Wheat Plant: a Monograph*, by J. Percival (Duckworth and Co., 1921). (J. P.)

PRODUCTION AND TRADE

Great Britain.—In 1929 wheat occupied only about one-seventh of the arable acreage in England and Wales as a whole and little more than one-twentieth of the total cultivated area. These proportions are somewhat lower than those which obtained in the decade immediately preceding the World War; and while the proportion of the arable land devoted to this crop has become almost constant—varying mainly with soil and weather conditions at the time of sowing—there is still an annual shrinkage of arable acreage, and with it a reduction in the wheat crop.

Although, from its present position in British agriculture, wheat would hardly appear to be a crop of prime importance, yet the fluctuations in acreage must be observed with great interest; they largely indicate the prosperity or adversity of arable cultivation on heavy clay soils, particularly in the eastern and southern portions of England, where climatic conditions favour the ripening and harvesting of a good sample of grain. Wheat is the principal source of revenue from arable crop production on heavy land. This class of soil is unsuitable for other cash crops, such as potatoes, sugar beet or barley, which enable the light land farmer to continue arable cropping with more or less satisfactory financial results. The conversion of arable land to permanent grass in Great Britain has been closely associated with the abandonment of wheat cultivation on heavy soils; and it may be suggested that the revival of tillage in England can come about only with the return of more renumerative prices or less costly production of the wheat crop.

The close connection between wheat prices and the area under tillage may be illustrated by the fact that in the years 1871–75, when wheat averaged 12s. 9d. per cwt., there were 14,766,000 acres of arable land in England and Wales, of which nearly 25% were devoted to wheat. With the decline in price to 6s. 6d. per cwt. in 1901–05, however, the arable area had diminished to 11,914,000 acres, and of this less than 14% was cropped with wheat. The percentage devoted to wheat in 1871–75 and 1901–05 respectively indicates that it is the wheat-growing class of land that has gone out of arable cultivation.

Wheat is regarded as a heavy land crop more because it excels the other cereals on strong soils than because of its preference for this class of land. By suitable manurial treatment heavy yields can be obtained from light soils also, as is the case in Norfolk, parts of Lincolnshire, Lancashire and the Lothians, where wheat occupies a regular place in light loam farming. Although her average yield is very high, Denmark has no land sufficiently strong to comply with the English conception of typical wheat and bean soil.

In Britain, wheat cultivation is conducted under the most favourable climatic conditions on the drier eastern side of the country. While conditions on the western side are favourable to the vegetative development of the plant, wet weather in August and September frequently impedes the harvesting of the crop and injures the milling quality of the grain. As regards temperatures the warmer summer conditions of the southern counties of England cause the crop to ripen a little earlier there than in the Lothian counties of Scotland; and while this does not ensure a higher yield per acre, it produces a better quality of grain for milling or for seed, and the earlier removal of the crop favours autumn tillage operations.

Little wheat is grown in Britain as far north as Aberdeen, although in Scandinavia and Russia this cereal is cultivated in latitudes beyond that of the Shetland islands. High altitudes in Britain, being associated with heavy rainfall and late ripening, are not favourable to wheat growing. In Derbyshire, for example, this crop is rarely cultivated at elevations higher than 600 ft., except on southern slopes where the limit may be 800 ft. In the more southern latitudes of the Alps, however, wheat is grown at altitudes exceeding 3,000 ft. Provided that sufficient moisture is available, wheat in one or other of its several forms can be grown in any latitude between the northern limits above mentioned and that of about 5° from the equator.

Comparative Wheat Yields.—As indicating the comparative yields in various countries it may be said that, on the basis of figures averaged for 1923–26, the yields per unit of area were as follows:—

Country	*Yield*
United Kingdom	22 quintals per hectare
Denmark	28 " " "
Holland	27 " " "
Belgium	26 " " "
Germany	18 " " "
France	14 " " "
Canada	12 " " "
United States	10 " " "
Australia	9 " " "
India	8 " " "
Argentina	8 " " "
Russia	7 " " "

As regards the intensity of cultivation it seems to be impossible to get any more adequate test than the yield per unit of area, for the nearer and more real test is related to the annual outlay on the crop per unit of area and per unit of yield, and this can hardly be available for many years.

The fact that more than 80% of the wheat consumed in th

United Kingdom comes from overseas has been frequently stated to be a weakness in British defence organisation, but is not at present looked upon as liable to incur shortage of bread corn in peace times. Except for a short period during and immediately after the World War, it has not recently been part of the national policy to induce the British farmer to grow wheat instead of grass. Although the possibility of serious competition with other countries similarly dependent on imported supplies of bread stuffs is commonly regarded as too remote for consideration, it is nevertheless deserving of notice that Eastern races are tending more and more to replace rice by wheat in the national ration.

For the five years 1909–13 the world's wheat crop was approximately 100,000,000 tons. The crops of the years 1923, 1924 and 1925 were 103,- 92,- and 105,000,000 tons, respectively, indicating little change in total output. Of the wheat harvested in 1925, the United States of America contributed 18·1 million tons, Russia 15·7, Canada 11·2, France 9·0, India 8·8, Italy 6·6, Argentina 5·2, Spain 4·4, Germany 3·2, Australia, North Africa and Rumania each 2·9, and Hungary 2·0. The most important changes in the output since 1909–13 were a decrease of 3,000,000 tons in Russia, an increase of nearly 6,000,000 tons in the Canadian production, and an increase of about 1,000,000 tons in that of the Argentine.

Some of the most important producing countries, however, are large consuming centres, and either have little surplus to export or actually import wheat for home consumption. The greater part of the wheat upon which importing countries depend for their supplies is produced in North America, Argentina and Australia. On the average of the three years 1924–27, the quantities *exported* from various sources were as follows:—Canada 7,000,000 tons, United States 5, Argentina 3¼, Australia 2¾, other countries, 2½; total 20¼ million tons. "Other countries" includes Hungary, the Balkans, Russia, North Africa, India, Chile and Uruguay.

The chief *importing* countries and the quantities received by each, on the average of the three years 1924–27 were as follows:—Great Britain and Ireland 6,000,000 tons, Italy 2½, Germany 2, France 1½, and Belgium 1. The remaining 7¾ million tons were imported by the following countries:—Holland, Czechoslovakia, Scandinavia, the Baltic States, Austria, Poland, Switzerland, Japan and Egypt. There are, however, other importing countries including Hungary, the Balkans, Russia, North Africa, India, Chile and Brazil.

Wheat Supply.—The question of when the production of food stuffs will begin to lag behind the increasing needs of the swelling population of the world is not a new one. Since Malthus issued his warnings in the 18th century, the world population has increased from 850,000,000 to 1,750,000,000 without apparent danger of general food scarcity. Sir Daniel Hall, however, in his presidential address to the agricultural section of the British Association at Oxford in 1926, questioned the possibility of providing for any much greater increase in the number of people by the same method as had been adopted during the past century, viz., by bringing new land under agriculture. On the basis of 2½ acres per individual, the increase of 5,000,000 in white population alone would require an additional 12,500,000 acres of land brought into cultivation each year—an area one-third the size of England and Wales—and he contended that it is difficult to find land at that rate. The conclusion to which his argument led was that it would be necessary to intensify the production of the land already under cultivation. At the same time, it is highly probable that very considerable areas of hitherto unutilized land will be brought under cultivation as mankind realizes the need for it.

Although no statistical survey of the potential wheat growing possibilities of the world has been made, it is evident that there are still vast areas of uncultivated or semi-cultivated land available for future development. At the above mentioned Oxford meeting Lord Bledisloe stated that Canada had a total of 300,000,000 acres fit for growing wheat—including the recently-discovered frost-resistant variety. The present area of wheat in Canada is about 23,000,000 acres. Argentina is another country with great possibilities in wheat production, and Australia has many millions of acres awaiting development. Rapid as has been the expansion of wheat cultivation in Australia, from 3,500,000 acres in 1895 to 11,500,000 acres in 1926, only a small portion of the available area has yet been brought into service. It is estimated that the area of land in Australia with climate and soil suitable for wheat growing is not less than 150,000,000 acres.

While the above figures do not cast the possibility of land shortage into the remote future, they do indicate that there is little likelihood of such a cause affecting the acreage of wheat grown in Britain for many years. Without the addition of new areas and without the full exploitation of intensive production on existing wheat lands, a considerable surplus of wheat is already produced in the chief exporting countries that never leaves the country in which it has been grown. In the years 1926–27, according to the statistics of the International Institute, about 3,300,000 tons available for export were not actually sold for that purpose. On the other hand, it must be recognised that the appearance of over production (*circa* 1928) is due in part to the fact that large sections of people are not able to exercise their pre-war demand for food, but owing to poverty are living at a lower level of consumption.

The British Wheat Position.—Although the larger proportion of the wheat consumed in Great Britain is imported, the quantity of home-produced wheat is fairly considerable. It is officially estimated that 75% of the total home crop is marketed, so that British farmers sell 1,000,000 to 1,100,000 tons of wheat per annum, to the value of about £12,500,000. Marketings are much the heaviest in the autumn and winter, so that as a rule three-fourths of the total sales take place in the six months September to February, and there is very little British wheat on the market in the summer. Farmers offer their grain at the local markets throughout the country, the sales being by private treaty to millers and corn merchants. Formerly the grain was taken to the markets in bulk, but nowadays the usual practice is to show samples only. Of the wheat purchased from farmers by corn merchants the bulk is ultimately made into flour, but there is a growing demand for British wheat for feeding to poultry, and individual farmers find this a useful market. With the increasing efficiency of the large mills, the smaller country mills become steadily fewer, so that an increasing proportion of home-grown wheat passes through the hands of merchants on its way to the larger mills.

About half the wheat produced in Great Britain is grown in the eastern counties, and it is in these counties that the most important markets for this grain are to be found. In 1926 over 23,000 tons of British wheat were sold on the Norwich market, and nearly as much in Lincoln, while about 37,000 tons were sold at Hull. From 10,000 to 15,000 tons were sold at each of the following towns in the eastern counties: Cambridge, Chelmsford, Colchester, Boston, Spalding, Peterborough and Ipswich. Sales in London totalled 24,000 tons, and in Bristol and Manchester rather over 20,000 tons. Leeds and Salisbury were the only other towns in the country at which as much as 10,000 tons of British wheat were sold.

The quantity of wheat imported is approximately 5,000,000 tons per annum, to the value of about £60,000,000 sterling. The imports in the five years 1922–26 were practically the same in quantity as in the ten years before the World War, when their value averaged £40,000,000 sterling per annum. Forty years earlier, in the 'sixties of the 19th century, imports of wheat were only about 1,500,000 tons, so that they were increased more than threefold during that period.

Of the total imports of wheat into Britain about one-half comes from Empire countries, Canada being now the chief source of supply within the empire. More wheat is received from the United States than any other non-British country, so that North America supplies 60% of the total imports. In the five years 1922–26 imports from Empire countries averaged 2,481,000 tons per annum, Canada furnishing over 60% of this quantity, Australia about 23% and India about 13%. In the same period imports from other countries averaged 2,593,000 tons, of which the United States supplied 60% and Argentina 34%, with Ger-

many and Russia the next most important suppliers. These last two countries sent rather over 100,000 tons each in 1926.

Since immediately before the World War there has not been any very appreciable change in the proportion of the total British imports obtained from the Empire and other countries, respectively, but there have been appreciable changes in the proportions obtained from individual countries. In the five years 1909–13 the average annual imports from India were larger than from any other country, but in 1922–26 India took only the fifth place, supplies from that country having declined by two-thirds. Supplies from both Canada and the United States, on the other hand, have increased by about two-thirds, while Russia, which in 1909–13 supplied about 15% of the total imports, in 1922–26 furnished less than 1%.

The average annual British imports of wheat have been as follows:—

Countries from which consigned	1909–13	1922–26
	Tons	Tons
Argentina	835,000	877,000
Chile	38,000	29,000
Germany	13,000	44,000
Russia	789,000	44,000
United States	934,000	1,567,000
Total non-British countries*	2,678,000	2,593,000
Australia	588,000	574,000
Canada	908,000	1,555,000
India	969,000	328,000
Total British countries*	2,488,000	2,481,000
Total	5,166,000*	5,074,000*

*Includes imports from countries not named.

The trade in wheat is worldwide, prices in practically all countries being affected as much by the total world supplies as by the yields of local crops. In the latter half of the year the trade is chiefly influenced by the yields or prospective yields in Europe and North America, whereas in the early months of the year the crops of Argentina and Australia have an important effect on the trade. It is to be remembered that the trade is worldwide; that in every month of the year wheat is being harvested in some part of the globe; and that in very many countries wheat is sown in the autumn, so that the crop is subject to the good and bad influences of weather for long periods. For these reasons prices fluctuate daily according to the reports received on the markets regarding the changing prospects of the yields and the actual results of the harvests in different countries. Important changes in price levels, however, most often take place in the British summer and early autumn, when the crops of the northern hemisphere, which produces much the larger proportion of the world's yield, are being harvested. (H. C. L.; J. R. B.)

WHEAT PRODUCTION IN AMERICA

Wheat was introduced to the infant English colonies in Virginia and Massachusetts soon after their settlement in 1607 and 1620, respectively. It had been introduced to Mexico by the Spanish, however, probably as early as 1530. Strangely enough, however, it was not wheat but maize, or Indian corn, that became the staple meal of these English colonists in America, and more than once saved them from starvation.

There were good reasons for the superiority of corn over wheat on the Atlantic coast. The soil and climate were better suited to it. Maize was much easier to plant, cultivate, and harvest in the rough clearings, among stumps and stones. Maize was more easily ground and cooked with primitive kitchen utensils.

Wheat production developed commercially with the westward progress of settlement to better wheat soils and climates, with the increasing of towns and cities, and with improved facilities for handling the crop in field and mill. The first American wheat belt stretched from Delaware and Maryland to central New York. This district still grows much wheat. The States of the Ohio valley were the next centre of commercial wheat production. They are to-day a centre for the production of the soft red winter wheats. The opening of canals in the Potomac valley and New York enabled the movement of this wheat to the more populous eastern seaboard, and the building of railroads greatly speeded and extended the process.

The most rapid expansion of American wheat production took place immediately after the Civil War, and occupied the period from 1866 to about 1890. It was due to three principal factors. First, the development of large-scale harvesting and threshing machinery, which had been the goal of inventors for years prior to the war. Secondly, the advance of settlement from the rolling forested lands of the East to the relatively level open prairies and plains of the great West, with their better wheat soils, and suitability to machine operations. Thirdly, the release of a large body of adventurous young spirits from the armies, with a desire for the strenuous life of the new frontiers.

Wheat was the dominant crop in this new inland empire. Favourable soil and climate, level open fields, and large machinery units made production profitable on low-priced land, much of it homesteaded. Wheat was a concentrated crop, readily storable under frontier conditions, and haulable by team for relatively long distances in summer or winter. Being a staple food crop, it always was readily saleable.

Distinct wheat-growing areas have developed, based on differences in the kinds of wheat grown, or in the methods of growing them. Most of the country grows winter wheat, but two classes of spring wheat are grown near the northern boundary. The five great commercial classes of wheat in America are: (1) Soft red winter, (2) hard red winter, (3) hard red spring (common), (4) durum (hard amber spring), and (5) white wheat, which consists of both winter and spring wheats, both club and common, but all having white kernels.

The soft red winter wheats occupy the humid eastern United States from the Atlantic Ocean westward to about the line of 30-inch rainfall, which runs from eastern Texas to north-western Iowa, and thence eastward to the Great Lakes. They are used primarily for making pastry flours, and for blending with the stronger hard wheats in the manufacture of bread flour.

The hard red winter wheats occupy the southern two-thirds of the Great Plains area, and also eastern Montana and some dry-land areas in Idaho and Oregon. These wheats are used directly for making bread flour for domestic use and for export as wheat or flour, or for blending with soft wheats for both domestic and export purposes.

The hard red spring wheats predominate in Minnesota, the Dakotas, eastern Montana, and far northward into Canada, where an isolated production district is found in the Peace River valley at about latitude 56° N. They are used for blending with the soft wheats in the making of bread flours and command premium prices when of high quality.

The durum wheats are found in western Minnesota and the adjacent eastern portions of the Dakotas. These extra hard wheats are grown primarily for the making of semolina, a fine meal from which are manufactured the various edible pastes such as macaroni, spaghetti, vermicelli, and noodles. Some is milled and manufactured in America and some is exported.

The white wheats occupy a small district in New York and adjacent Ontario, and larger districts in the Pacific Northwest and in California. They are used for making pastry flours and for blending with harder wheats in the making of bread flours. Large quantities are exported.

The wheat-growing areas of the United States may be divided climatologically into humid (more than 30 inches of precipitation), semi-arid (15–30 inches), and arid (less than 15 inches). In the humid areas, soft red winter wheat is grown in a rotation with corn and hay or pasture. In the semi-arid Great Plains area, the hard red winter wheat and the hard red and durum spring wheats are grown in rotation to some extent with corn or sorghums, and to a small extent with legumes, such as alfalfa, sweet clover, and red clover. In the arid region west of the Rocky Mountains the precipitation of two years is necessary to produce one crop of wheat. The land is bare-fallowed in the alternate season to con-

serve moisture for the succeeding crop. Very little rotation of crops can be practiced.

In general, wheat is a cool-weather plant. About two-thirds of the American wheat crop is of winter varieties, germinating and making vigorous root growth with diminishing temperatures in the fall, and vigorous shoot growth with the slowly increasing temperatures in the spring and early summer. Spring wheats must be sown as early as possible, just as soon as the frost is out and the land can be worked, so that their early growth may be in cool weather. Ripening occurs in warm to hot weather.

The northern limit of successful production of winter wheat has been moving steadily northward during the last fifty years. North Dakota is now the only one of the wheat-growing States of the northern boundary which does not produce winter wheat. The production of hard red winter wheat extends across the Canadian boundary from Montana into southern Alberta. The northern limit of spring wheat production also is moving north with the development of earlier varieties and better methods.

Wheat grows best on relatively heavy soils, such as clays, clay-loams, and loams, but does not do well on sandy loams, and sands, to which rye is much better adapted. In general, the higher the fertility of the soil the better the wheat yields.

The wheat crop is subject to many hazards during its growth and harvesting. Some are climatic; others are biologic. The chief climatic hazard is winterkilling, due to one or more of several causes, including fall drought, winter drought, alternate freezing and thawing, soil blowing, low temperatures without snow cover, and smothering by ice. Other causes of climatic injury are spring or summer drought, hot winds, hail storms and wind storms. Among the chief biologic factors are rodents, insects and fungous diseases. Rodents usually are not very destructive to wheat, although squirrels, rabbits and prairie dogs take their annual toll. Insects often cause heavy losses. The most destructive are Hessian fly, joint worms, aphids ("green bugs"), grasshoppers, white grubs and wire worms. Fungous diseases, individually and collectively, may be tremendously destructive to the wheat crop. The heaviest losses are caused by two stinking smuts, loose smut, stem rust, leaf rust, seedling blights, scab and foot-rots.

Average yields of all wheat in the United States vary around 14·5 bushels per acre. This often is cited against America because yields in England and Germany are rather more than double this quantity. There is no fair comparison. England and Germany are both wholly in the cool humid climate so favorable to wheat. The United States, with its enormous area, covers much territory which is relatively hot and dry, and where yields naturally are low. American farmers, using large-scale machinery and much land, produce enormously more wheat per man than the farmers of Europe, where land is scarce, wages are lower, and much hand labour is used.

Consumption of wheat per capita increased in America until about the end of the last century. This was due to increasing prosperity, abundance of cheap wheat, improved milling and baking, and increasing population in cities where bread was largely used in a somewhat restricted dietary. More recently per capita consumption seems to be decreasing. Among the causes are (a) increasing buying power of the workers in industry, (b) broadening dietary due to greater production of truck crops around cities, refrigerator transportation, cold storage, and household refrigeration, (c) campaigns against white bread (probably a temporary influence), and (d) relatively higher price of wheat. While the influence of these different factors may vary in the future, it is doubtful if the per capita consumption ever will rise to its former level. On the other hand, many peoples in other lands, now subsisting chiefly on millets, grain sorghums, and rice, may eat more wheat when it is economically possible. (C. R. Bl.)

Wheat Trade of the United States.—About two-thirds of the wheat crop of the United States enters into domestic trade and a little more than one-fifth of the crop is exported. In the past five seasons (1923–27) production has averaged a little more than 810,000,000 bushels. The total supply has been utilized about as follows: seed, 85,000,000 bushels; feed, 60,000,000; flour for domestic use, 485,000,000 bushels and wheat, including flour for export, 180,000,000. A large part of the wheat used in making flour for domestic use and small quantities of the grain used for feed and seed enter into trade. Between 1923 and 1927 about 560,000,000 bu. were shipped annually from wheat-growing districts of the United States.

Most of the wheat entering into trade is produced west of the Mississippi river. The Great Plains States from Texas north and Oregon, Washington and Idaho produce large quantities of wheat in excess of local requirements. Most of the surplus of the northern Great Plains moves to Minneapolis, a large milling centre, or to Duluth for shipment to eastern mills or to the Atlantic Coast ports for export. Much of the grain from the central Great Plains moves through Chicago, St. Louis and Milwaukee for eastern milling centres and for export, and from the central and southern Great Plains to Kansas City or smaller primary markets for milling, or to New Orleans and Galveston for export. The most important primary market or concentration point on the Pacific Coast is Portland.

The diversity of the wheat of the United States is an important factor in its marketing. Each of the five leading commercial classes of wheat is produced within a reasonably well defined region from which it is regularly marketed. Most of the hard red spring is produced in the northern States, Minnesota, North Dakota, South Dakota and Montana. Most of the durum is produced in North Dakota, South Dakota and Montana. The hard red winter wheat is the product of the southern and central Great Plains, whereas the soft red winter wheat is the product of the more humid southern and eastern parts of the United States.

There are two chief centres of white wheat production, the eastern lake states, the Pacific Coast states and Idaho. A very large part of the hard red spring wheat is marketed through Minneapolis or Duluth and practically all of it is annually consumed within the United States. A large proportion of the durum is marketed through Minneapolis and Duluth and a large part of the durum marketed is for export, mostly through Duluth. The most important hard red winter wheat market is Kansas City but large quantities of this wheat also move through Chicago, St. Louis, New Orleans and Galveston. There is nearly always a surplus of this wheat for export. A large proportion of the soft red winter wheat is consumed within or near the areas of production. St. Louis is the most important primary market for this kind of wheat. Considerable quantities are distributed through eastern markets and small quantities are exported. On the average, however, there is very little soft red winter wheat available for export. Small quantities are normally produced for export from the Pacific Coast states. Most of the white wheat produced in the eastern states is used locally while considerable quantities of western white wheats are exported. In years of normal production in all classes considerable quantities of hard red winter, durum and white wheats are exported, but only small amounts of soft red winter and hard red spring wheats.

Wheat: Exports from the United States, by classes, 1922-27

Year	Hard red spring	Durum	Hard red winter	Soft red winter	White	Total*
	1,000 bushels	1,000 bushels	1,000 bushels	1,000 bushels	1,000 bushels	1,000 bushels
1922	17,046	41,837	58,891	23,243	13,945	154,951
1923	3,152	16,546	26,002	13,395	19,698	78,793
1924	37,143	31,278	107,520	7,820	11,729	195,490
1925	3,159	30,331	10,742	2,528	16,429	63,189
1926	1,562	21,875	75,000	31,250	26,563	156,250
1927†	6,806	21,780	63,979	13,613	29,948	136,126

United States Department of Agriculture, Bureau of Agricultural Economics, Foreign News on Wheat, F. S.-WH-18, June 14, 1928.

*Totals reported by the Department of Commerce. Distribution by classes made on basis of inspections for export and Canadian inspection of United States wheat.

†Ten months.

Small quantities of wheat are annually imported from Canada, most of it to be mixed with United States domestic wheat to produce flour for foreign markets. This wheat is imported and

ground in bond. In years when the hard red spring wheat crop of the United States is very short small quantities may be imported, duty paid, for domestic consumption.

Futures exchanges are important in the marketing of the wheat crop, much of the future trading being negotiated at Chicago and some at Minneapolis and Kansas City. The United States has exported a surplus of wheat in every year of its history except 1836. The first great stimulus to exports was the repeal of the British Corn laws which went into effect in 1850, but the greatest expansion came after the Civil War, from 1866 to 1880. Exports reached a high point in the World War period and then declined, but continued in large volume. A large proportion of the exports of both wheat and flour are for northern Europe, with the United Kingdom the most important buyer. Central and South America furnish a stable market and shipments to the Orient are increasing. (O. C. S.)

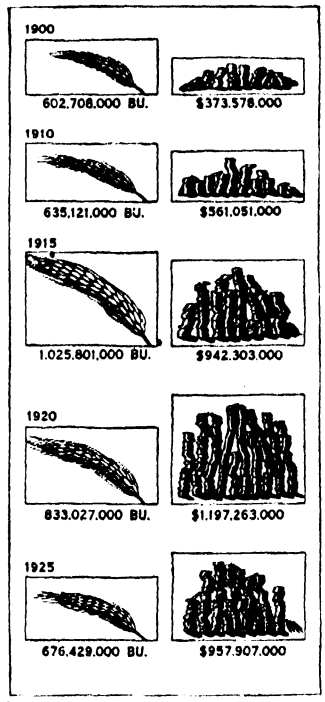


CHART SHOWING HOW THE VALUE OF THE WHEAT CROP IN THE UNITED STATES CHANGES ACCORDING TO THE SUPPLY

WHEATEAR, *Oenanthe aenanthe*, one of the earliest spring migrants, often reaching England by the end of February. The cock bird, with his bluish-grey back and light buff breast, set off by black ear-coverts, wings, and part of the tail, is rendered conspicuous in flight by his white rump. When alarmed both sexes have a sharp monosyllabic note that sounds like *chat*. The nest is placed underground; a large amount of soft material is collected, and on it from five to eight pale blue eggs are laid. Wheatears were formerly trapped for the table in enormous numbers on the Downs. The wheatear ranges throughout the Old World, extending in summer far within the Arctic circle, from Norway to the Lena and Yana valleys, while it winters in Africa beyond the equator and in India. It also breeds in Greenland and some parts of North America. About eight species are included in the European fauna; but the majority are inhabitants of Africa. Several of these are birds of the desert.

Amongst allied genera is *Saxicola* which includes two well-known British birds, the stonechat (*q.v.*) and whinchat (*q.v.*). The wheatear and its allies belong to the family *Turdidae*, the thrushes (*q.v.*).

WHEATLEY, JOHN (1869–), British statesman, was born on May 18, 1869. Educated in village schools in Lanarkshire, he worked in the coal mines till 1891. After serving two years on the Lanarkshire county council, he was elected to the Glasgow city council in 1912, becoming a baillie, and acting as leader of the Labour group. He was also chairman of the Scottish National Housing Council. In 1922 he was elected M.P. for the Shettleston division of Glasgow. A member of the Independent Labour party from 1908, he was on its administrative council in 1923 and 1924. As minister of health in the Labour Government he was responsible for the Housing Act of 1924, which provided for a continuous building programme over a period of 15 years, designed to secure the erection of 2,500,000 houses to be let at rents within the means of the working class population.

WHEATON, HENRY (1785–1848), American lawyer and diplomat, was born at Providence, R.I., on Nov. 27, 1785. He graduated at Brown University in 1802, was admitted to the bar in 1805, and, after two years' study abroad, practised law at Providence (1807–12), and at New York city (1812–27). He was a justice of the marine court of the city of New York from 1815 to 1819, and reporter of the United States supreme court from 1816 to 1827. In 1825 he was a reviser of the laws of New York.

His diplomatic career began in 1827, with an appointment to Denmark as chargé d'affaires, followed by that of minister to Prussia, 1837 to 1846. During this period he had published a *Digest of the Law of Maritime Captures* (1815); twelve volumes of *Supreme Court Reports*, and a *Digest;* a great number of historical articles, and some collected works; *Elements of International Law* (1836), his most important work, of which a 6th edition with memoir was prepared by W. B. Lawrence and an eighth by R. H. Dana (*q.v.*); *Histoire du Progrès du Droit des Gens en Europe*, written in 1838 for a prize offered by the French Academy of Moral and Political Science, and translated in 1845 by William B. Lawrence as *A History of the Law of Nations in Europe and America;* and the *Right of Visitation and Search* (1842). The *History* took rank at once as one of the leading works on the subject of which it treats.

Wheaton's general theory is that international law consists of "those rules of conduct which reason deduces, as consonant to justice, from the nature of the society existing among independent nations, with such definitions and modifications as may be established by general consent." He died at Dorchester, Mass., on March 11, 1848.

WHEATON, a city of Illinois, U.S.A. Pop. (1920) 4,137 (88% native white); estimated locally at 8,000 in 1928. The city was founded in 1837, and incorporated in 1859.

WHEATSTONE, SIR CHARLES (1802–1875), English physicist and the practical founder of modern telegraphy, was born at Gloucester in Feb. 1802. Wheatstone was educated at several private schools. He became a musical instrument maker and carried out a number of experiments in acoustics. Wheatstone was so excessively shy that he was unable to lecture in public and many of his inventions were first described by Faraday in his Friday evening discourses at the Royal Institution. By 1834 his originality and resource in experiment were fully recognized, and he was appointed professor of experimental philosophy at King's College, London, in that year. About this time Wheatstone made his determination, by means of a revolving mirror, of the speed of electric discharge in conductors, a piece of work leading to enormously important results. The great velocity of electrical transmission suggested the possibility of utilizing it for sending messages; and, after many experiments and the practical advice and business-like co-operation of William Fothergill Cooke (1806–1879), a patent for an electric telegraph was taken out in their joint names in 1837.

Wheatstone's best work was in the invention of complicated and delicate instruments. He was interested in cryptography; he deciphered a number of the mss. in the British Museum, and invented a cryptographic machine. He wrote papers on the transmission of sound in solids, the explanation of Chladni's figures and the invention of new musical instruments, *e.g.*, the concertina (*q.v.*). He invented the kaleidophone which presented visible the movements of a sounding body and the stereoscope. He also wrote papers on the eye, the physiology of vision, binocular vision and colour. Wheatstone showed that the electrical sparks from different metals give different spectra. His most important inventions are in electricity; he played a prominent part in the development of telegraphy on landwires and carried out the first experiments with submarine cables. He devised the "A.B.C." telegraph instrument, an automatic transmitter, and various forms of electrical recording apparatus.

Wheatstone became F.R.S. in 1837; and in 1868, after the completion of his masterpiece, the automatic telegraph, he was knighted. He died on Oct. 19, 1875.

Wheatstone's *Scientific Papers* were collected and published by the Physical Society of London in 1879. Biographical notices of him will be found in the *Proc. Inst. C.E.*, xlvii. 283, and *Proc. Roy. Soc.*, xxiv., xvi. For his connection with the growth of telegraphy, see *Nature*, xi. 510, and xii 30 *seq.*

WHEATSTONE'S BRIDGE, a network of six conductors of which four, AB, BC, CD and DA form a closed circuit

while the others, AC and BD, contain a battery and a galvanometer respectively. When the resistances of the first four are so adjusted that no current from the battery in AC flows through the conductor BD containing the galvanometer it follows that the resistance of AB : that of BC :: the resistance of AD : that of DC. Hence the resistance of DC is determined if the ratio of the first pair (the "ratio arms") is known together with the exact magnitude of the third (AD). This is the principle of the Post Office Box, the Metre Bridge, the Carey Foster Bridge, the Callendar-Griffiths Bridge, and of many other devices for the comparison of resistances, inductances, and capacitances. The arrangement was devised by S. H. Christie in 1833, and used by Sir Charles Wheatstone in 1847 (*Scientific Papers*, p. 129, or *Phil. Trans.* 1847). (*See* INSTRUMENTS, ELECTRICAL.)

WHEEL, a circular frame or solid disc revolving on an axis, of which the function is to transmit or to modify motion. *See* MECHANICS. Vehicular wheels in the earliest times were circular discs, either cut out of solid pieces of wood or formed of separate planks of wood fastened together and then cut into a circular shape. Such may be still seen in use among primitive peoples to-day. The ordinary wheel consists of the nave (O. Eng. *nafu; cf.* Ger. *Nabe*, allied with "navel"), the central portion or hub, through which the axle passes, the spokes, the radial bars inserted in the nave and reaching to the peripheral rim, the felloe or felly. (O. Eng. *felge*, Ger. *Felge*, properly that which fitted together, Teut. *felhan*, to fit together.)

See also CARRIAGE; CHARIOT; HORSE-DRAWN VEHICLES; MOTOR-CAR; MOTOR-CYCLE; BICYCLE.

WHEEL, BREAKING ON THE, a form of torture (*q.v.*) or of execution formerly in use in France and Germany, where the victim was placed on a cart-wheel and his limbs stretched out along the spokes. The wheel was made to revolve slowly, and the man's bones broken with blows of an iron bar. Sometimes it was mercifully ordered that the executioner should strike the criminal on chest or stomach, blows known as *coups de grâce*, which at once ended the torture, and in France he was usually strangled after the second or third blow. A wheel was not always used. In some countries it was upon a frame shaped like St. Andrew's cross that the sufferer was stretched. The punishment was abolished in France at the Revolution. It was employed in Germany as late as 1827. A murderer was broken on the *row* or wheel at Edinburgh in 1604, and two of the assassins of the regent Lennox thus suffered death.

WHEELER, JOSEPH (1836–1906), American soldier, was born at Augusta, Ga., in 1836, and entered the U.S. cavalry from West Point in 1859. He resigned to enter the Confederate service. In a short time he became colonel of infantry and took part in the desultory operations of 1861 in Kentucky and Tennessee. He commanded a brigade at the battle of Shiloh, but soon afterwards he returned to the cavalry arm, in which he won a reputation second only to Stuart's. After the action of Perryville he was promoted brigadier general, and in 1863 major general. Thenceforward throughout the campaigns of Chickamauga, Chattanooga and Atlanta he commanded the cavalry of the Confederate army in the west, and when Hood embarked upon the Tennessee expedition, he left Wheeler's cavalry to harass Sherman's army during the "March to the Sea." In the closing operations of the war, with the rank of lieutenant general, he commanded the cavalry of Joseph Johnston's weak army in North Carolina, and was included in its surrender.

At the outbreak of the Spanish-American War, in 1898, President McKinley commissioned Wheeler as major general of United States volunteers. He commanded the cavalry in the actions of Guasimas and San Juan, was afterwards sent to the Philippines in command of a brigade, and in 1900 was commissioned a brigadier general in the regular army. He died on Jan. 25, 1906. He wrote *The Santiago Campaign* (1898).

See John Witherspoon Du Bose, *General Joseph Wheeler and the Army of Tennessee* (1912); W. C. Dodson, *Campaigns of Wheeler and his Cavalry (1899), from material furnished by Wheeler.*

WHEELER, WILLIAM ALMON (1819–1887), vice president of the United States from 1877 to 1881, was born at Malone, N. Y., June 30, 1819. He studied at the University of Vermont for two years and in 1845 was admitted to the bar. First as a Whig, and then, after 1856, as a Republican, he was prominent for many years in State and national politics. He was a member of the State assembly in 1849–50, a member and president *pro tempore* of the State Senate in 1858–59, and a member of the national House of Representatives in 1861–63, and again in 1869–1877. He was the author of the so-called "Wheeler Compromise," by which the difficulties between contending political factions in Louisiana were adjusted in 1875. Nominated for vice president by the Republicans in 1876 on the ticket with President Hayes, he was installed in office through the decision of the Electoral Commission. He died at Malone, June 4, 1887.

See biographical sketch in W. D. Howells, *Sketch of R. B. Hayes* (1876).

WHEELER, WILLIAM MORTON (1865–), American zoologist, was born at Milwaukee March 19, 1865. He graduated from the German-American Normal College in 1884; received the Ph.D. degree, 1892, from Clark University; Sc.D. from the University of Chicago, 1916. He was assistant professor of embryology, University of Chicago, 1896–99; professor of zoology, University of Texas, 1899–1903; curator of invertebrate zoology, American Museum of Natural History, 1903–08. In 1908 he was made professor of economic entomology and dean of Bussey, and in 1926 professor of entomology, at Harvard. He is a member of the National Academy of Sciences and is associate editor of the *Biological Bulletin, Journal of Morphology* and of the *Journal of Animal Behaviour*. His publications include: *Ants, Their Structure, Development and Behaviour* (1910); *Social Life Among the Insects* (1923); *Foibles of Insects and Men* (1928), and monographs on numerous species of ants. He also translated and annotated *The Natural History of Ants*, from the French of René Antoine F. de Réaumur (1926).

WHEELING, a city of West Virginia, U.S.A. Pop. 56,208 in 1920, 87% native white; estimated locally at over 70,000 in 1928. The city's area of 11·8 sq.m. comprises a narrow strip of bottomland (640 ft. above sea-level), hills rising behind it on the east and an island over a mile long. Bridges connect with Bellaire, Bridgeport and Martins Ferry, Ohio. In addition to several parks and 20 playgrounds within its limits, the city has a country recreation centre of 750 ac., bequeathed by E. W. Oglebay. There is a municipal market, combined with a large auditorium. The city operates under a council-manager.

Wheeling is surrounded by vast coal-fields, and is plentifully supplied with natural gas and steam-generated electric power. It has over 200 diversified manufacturing plants, with an output in 1927 of $85,000,000 including iron, steel, tin plate, proprietary medicines, hand-rolled stogies, china and porcelain, nails, glass and paper. Bank debits in 1926 aggregated $567,631,000. The assessed valuation for 1927 was $121,540,963.

Wheeling was founded in 1769 by Col. Ebenezer Zane (1747–1811) of Virginia, and two brothers. In 1774 a strong stockade was built at the top of Main street hill, and named Ft. Fincastle in honour of the then governor of Virginia, but after 1776 called Ft. Henry, after Patrick Henry. Attacks from hostile Indians were frequent. During one of them (Sept. 1, 1777) when the ammunition in the fort failed, Elizabeth Zane, an 18 year old sister of the founder, faced the fire of the enemy to bring a keg of powder from a cabin 60 yd. away. In Sept. 1782, the fort was successfully defended by 42 inhabitants against a detachment of British soldiers and 250 Indians. The town was laid out by Col. Zane in 1793, incorporated in 1806 and chartered as a city in 1836. The national road was completed to this point in 1818, and for some years Wheeling was its western terminus as later it was for some years of the Baltimore and Ohio railroad. Wheeling was the headquarters of the Virginians opposed to secession, was the capital of the new State until 1869 and again from 1875 to 1885. The old capitol is now the city hall.

WHEELOCK, ELEAZER (1711–77), American educator, born at Windham, Conn., April 22, 1711. He graduated at Yale in 1733, studied theology, and in 1735 became a Congregationalist preacher at Lebanon, Conn. He also took young men into his

house to fit them for college. One of these was a Mohegan Indian, Samson Occum, who made such excellent progress, that Wheelock decided to found a free school where both whites and Indians could be educated. With aid from various sources he conducted such a school at Lebanon from 1754–67, but without a large attendance. Desiring a more favourable location, Eleazer accepted the offer of Gov. Wentworth of New Hampshire of a township of land on the Connecticut river. Thither he went with some 30 students in 1770, and with other settlers, they founded the town of Hanover. In recognition of the patronage of Lord Dartmouth the new college was named Dartmouth College. He died at Hanover, April 24, 1777.

His son, John Wheelock (1754–1817), succeeded him as president of Dartmouth.

WHELK, the name given to a large number of marine gastropod molluscs (*see* GASTROPODA, MOLLUSCA) with solid spiral shells, and in particular to the members of the genus *Buccinum* in which the common whelk (*Buccinum undatum*) is placed. *Fusus antiquus*, the "hard whelk" of British fishermen, is another common form of whelk. The rock whelks (*Murex*) and dog-whelks (*Purpura*) are allied forms. All these molluscs are placed in the sub-order Rachiglossa of the streptoneurous Gastropoda and are distinguished by their carnivorous and aggressive habits and the modification of their mouth-parts as an eversible proboscis. The *radula* (rasping tongue) is simple as compared with that of the plant-eating gastropods, and consists usually of three large teeth suited for tearing animal tissues. The nervous system is condensed by the approximation of the constituent ganglia and the shortening of the commissures. The eggs are deposited in horny capsules which are usually aggregated in clusters.

The common whelk has a wide distribution in the North Atlantic and ranges from the eastern seaboard of North America to the coast of Siberia. On the east side of the Atlantic the southern limit of its distribution seems to be the south end of the Bay of Biscay. It is found at all depths from low water mark down to about 100 fathoms and on many kinds of bottom. Certain varietal forms are said to occur at greater depths. It is a carnivore, eating both living animals and carrion, especially other molluscs, *e.g.*, clams and scallops. Indeed Petersen considers that in Danish waters the whelks prey on the plaice when caught in nets. Danish fishermen have estimated that one-third of the year's catch is lost in this way. In the British Isles the whelk is caught by the use of wicker crab-pots baited with living crabs, by dredging and by "trotting" (line-fishing with crabs tied together as bait).

See W. J. Dakin, "Buccinum," *Proc. and Trans. Liverpool Biological Society* (1912). (G. C. R.)

WHETSTONE, GEORGE (1544?–1587?), English dramatist and author, was the third son of Robert Whetstone (d. 1557). In 1572 he joined an English regiment on active service in the Low Countries, where he met George Gascoigne and Thomas Churchyard. Gascoigne was his guest near Stamford when he died in 1577, and Whetstone commemorated his friend in a long elegy. He wrote: *Rocke of Regarde* (1576), tales in prose and verse adapted from the Italian; *The right excellent and famous Historye of Promos and Cassandra* (1578), a play in two parts, drawn from the 85th novel of Giraldi Cinthio's *Hecatomithi; Heptameron of Civill Discourses* (1582, reprint in Hazlitt's *Shakespeare's Library*, vol. iii. 1875), a collection of tales which includes *The Rare Historie of Promos and Cassandra*. From this prose version apparently Shakespeare drew the plot of *Measure for Measure*, though he was doubtless familiar with the story in its earlier dramatic form. Whetstone accompanied Sir Humphrey Gilbert on his expedition in 1578–79, and the next year found him in Italy. The Puritan spirit was now abroad in England, and Whetstone followed its dictates in his prose tract *A Mirour for Magestrates* (1584), which in a second edition was called *A Touchstone for the Time*. In 1585 he returned to the army in Holland, and he was present at the battle of Zutphen.

His other works are a collection of military anecdotes entitled *The Honourable Reputation of a Souldier* (1585); a political tract, the *English Myrror* (1586), numerous elegies on distinguished persons, and *The Censure of a Loyall Subject* (1587). *See* the edition of *Promos and Cassandra* by J. S. Farmer, 1910, in *Tudor Facsimile Texts*.

WHEWELL, WILLIAM (1794–1866), British philosopher and Master of Trinity, historian of science, was born on May 24, 1794, at Lancaster. He was an exhibitioner of Trinity college, Cambridge, second wrangler in 1816, became fellow and tutor of his college, and, in 1841, succeeded Dr. Wordsworth as master. He was professor of mineralogy from 1828 to 1832, and of moral philosophy (then called "moral theology and casuistical divinity") from 1838 to 1855. He died on March 6, 1866.

Whewell was a famous Cambridge figure of his day, and there are many amusing stories about him. His first work, *An Elementary Treatise on Mechanics* (1819), co-operated with those of Peacock and Herschel in reforming the Cambridge method of mathematical teaching; to him in large measure was due the recognition of the moral and natural sciences as an integral part of the Cambridge curriculum (1850). In general, however, especially in later years, he opposed reform: he defended the tutorial system, and in a controversy with Thirlwall (1834) opposed the admission of Dissenters; he upheld the clerical fellowship system, the privileged class of "fellow-commoners," and the authority of heads of colleges in university affairs. He opposed the appointment of the University Commission (1850), and wrote two pamphlets (*Remarks*) against the reform of the university (1855). He advocated as the true reform, against the scheme of entrusting elections to the members of the senate, the use of college funds and the subvention of scientific and professorial work.

His philosophical reputation rests mainly on his *History of the Inductive Sciences, from the Earliest to the Present Time* (1837), which was intended as an introduction to the *Philosophy of the Inductive Sciences* (1840).

Whewell's other works include *Elements of Morality, including Polity* (1845); the essay, *Of the Plurality of Worlds* (1854), in which he argued against the probability of planetary life; the *Platonic Dialogues for English Readers* (1859–61); *Lectures on the History of Moral Philosophy in England* (1852); an edition and abridged translation of Grotius, *De iure belli et pacis* (1853), and an edition of the *Mathematical Works* of Isaac Barrow (1860).

Full bibliographical details are given by Isaac Todhunter, *W. Whewell: an Account of his Writings* (2 vols., 1876).

WHICHCOTE (or WHITCHCOTE), **BENJAMIN** (1609–1683), English divine and philosopher, was born at Whichcote hall, Stoke, Shropshire, and educated at Emmanuel college, Cambridge, where he became fellow in 1633. In 1644 he became provost of King's college, Cambridge, in place of Samuel Collins who was ejected. In 1650 he was vice-chancellor of Cambridge university. Cromwell in 1655 consulted him over extending tolerance to the Jews. His Puritan views lost him the provostship of King's college at the Restoration of 1660, but on complying with the Act of Uniformity he received the living of St. Anne's, Blackfriars, London and in 1668, of St. Lawrence Jewry, London. He is regarded as the founder of the school of Cambridge Platonists. He died in May 1683.

See John Tulloch, *Rational Theology*, ii. 59–84 (1874); and *Masters in English Theology*, edited by A. Barry (1877).

WHICKHAM, urban district in Durham, England. Pop. (1921) 19,155. The church of St. Mary has Norman and Transitional portions, and in the neighbourhood is the mansion of Gibside (17th century).

WHIG and **TORY,** the names used to denote two opposing political parties in England, were nicknames introduced in 1679 during the heated struggle over the bill to exclude James, duke of York, from the succession to the Crown. The term "Whig"—whatever be its origin in Scots Gaelic—was used of cattle and horse thieves and was thence transferred to Scottish Presbyterians. Its connotations in the 17th century were therefore Presbyterianism and rebellion; and it was applied to those who claimed the power of excluding the heir from the throne when they deemed it desirable. "Tory" was an Irish term suggesting a Papist outlaw and was applied to those who supported the hereditary right of James in spite of his Roman Catholic faith. The names were party badges until the 19th century. The Tories placed reliance on the Crown; the Whigs on the greater nobility. It may

be fanciful to trace this cleavage as far back as Magna Carta; but at least it must be remembered that the later ideals of popular or democratic government are entirely irrelevant to the creeds of Whig and Tory. The revolution of 1688–89 changed the position, forcing a majority of Tories to recognize allegiance to other than hereditary right to the Crown; and for a time they were thrown back on their opposition to religious toleration and to foreign entanglements, the expression of two cardinal principles of the older Toryism. Again in 1714 the failure of the Tory ministers to act together and themselves to determine who should succeed Anne, and the subsequent flight of their leader, Bolingbroke, discredited the Tories as Jacobites, and gave 50 years of political power to the Whigs. During this period the Whig landowners, with no effective king to fear, secured their hold on parliament by controlling a large proportion of the borough representation; and the Tories came to advocate, not only an effective balancing force in the Crown, but also the safeguard of a wider franchise and a purified electoral system.

When George III. came to the throne in 1760 the name of Whig covered many personal factions, for their long prosperity had brought disunion; and the new king, attempting to restore the monarchy to influence, could easily attach to himself some of these groups. The following 25 years were complicated by the formidable body of "king's friends," who cannot properly be called by either name. Even the American revolution cannot be considered in terms of the two parties. The nation emerged from the mixing bowl in 1784, with a new Toryism, led by the younger Pitt and a new Whiggism, leavened by the industrial interests and by the beginnings of a Radicalism which took up the demand for electoral and philanthropic reform. In contrast to Whig changes, the Tory party began to acquire the reputation of resistance to change; but the Reform Bill of 1832 and the willingness of Canning and Peel to face change, even through party disunion, led to the transformation of Toryism into the Conservatism of Disraeli, which while retaining its devotion to the Crown and the Established Church, expanded its fervent nationalism into a wider imperial outlook, a legacy from those Chathamite Whigs who were rarely at ease within the ranks of their nominal allies. Meanwhile, the commercial and radical wing of the great Whig party, abandoned by its more conservative members, became the main body of the Liberal Party, and Whiggism ceased to have any important political meaning. (*See* also CONSERVATIVE PARTY; LIBERAL PARTY.) (G. H. G.)

WHIG PARTY, a political party prominent in the United States from about 1824 to 1854. The name had been in use immediately before the Revolution and during that war to designate those who favoured the colonial cause and independence. The first national party system of the United States came to an end during the second war with Great Britain. The destruction of the Federalist Party (*q.v.*) through a series of suicidal acts which began with the alien and sedition laws of 1798, and closed with the Hartford convention of 1814–15, left the Jeffersonian Republican (Democratic) Party in undisputed control. Soon, however, the all-inclusive Republican Party began gradually to disintegrate and a new party system was evolved, each member of which was the representative of such groups of ideas and interests, class and local, as required the support of a separate party. Each new party, disguised during the early stages of organization as the personal following of a particular leader or group of leaders, kept on calling itself Republican. Even during the sharply contested election of 1824 the rival partisans were known as Jackson, Crawford and Calhoun, or as Clay and Adams Republicans (*see* DEMOCRATIC PARTY). It was not until late in the Administration of John Quincy Adams (1825–29), that the supporters of the President and Henry Clay, the secretary of State, were first recognized as a distinct party and began to be called by the accurately descriptive term National Republicans. But after the party had become consolidated, in the passionate campaign of 1828 and later, in opposing the measures of President Jackson, it adopted in 1834 the name Whig, which, through memorable associations both British and American, served as a protest against executive encroachments, and thus facilitated union with parties and factions, such as the Anti-Masonic Party (*q.v.*). The new name announced not the birth but the maturity of the party, as the inaugural address and the messages to Congress of President J. Q. Adams had set forth clearly its nationalizing, broad-construction programme.

The ends for which the Whigs laboured were: first, to maintain the integrity of the Union; second, to make the Union thoroughly national; third, to maintain the republican character of the Union; fourth, while utilizing to the full the inheritance from and through Europe, to develop a distinctly American type of civilization; fifth, to propagate abroad by peaceful means American ideas and institutions. Among the policies or means which the Whigs used in order to realize their principles were the broad construction of those provisions of the Federal Constitution which confer powers on the National Government; protective tariffs; comprehensive schemes of internal improvements under the direction and at the cost of the National Government; support of the Bank of the United States; resistance to many acts of President Jackson as encroachments on the legislative branch of the Government and therefore hostile to republicanism; coalition with other parties in order to promote national as opposed to partisan ends; resort to compromise in order to allay sectional irritation and compose sectional differences; and the expression of sympathy with the liberal movement in other lands.

The activity of the Whig Party together with the activities of the disparate elements which preceded their formation into a party, covered a period from the election of 1824 to the repeal of the Missouri Compromise in 1854. In two respects, namely, the rise of the new radical democracy under Andrew Jackson, and the growth of sectionalism over the slavery issue, this period was highly critical. In view of these events the most difficult task of the Whigs, under the patriotic and conservative leadership of Henry Clay and Daniel Webster, was to moderate and enlighten, rather than antagonize, the new democracy and to attempt to overcome the disrupting influence of the slavery issue.

The election of 1828 gave to Andrew Jackson the Presidency, and to the people, in a higher degree than ever before, the control of the Government. Opposition to Jackson's radical policy brought about, under Whig leadership, a coalition of parties which influenced deeply and permanently the character, policy and fortunes of the Whig Party. It became the champion of the bank, of the right of Congress, and of the older and purer form of the civil service. In strict accord with their own principles, however, the Whigs supported the President during the nullification controversy (*see* NULLIFICATION). The majority of the Northern Whigs, with the entire Southern membership of the party, disapproved the propaganda of the Abolitionists on the ground of its tendency to endanger the Union, and many from a like motive voted for the "gag rules" of 1835–44 (*see* ADAMS, J. Q.), which in spirit, if not in letter, violated the constitutional right of petition. In the election of 1832 Clay was the nominee of the National Republican Party for the Presidency. Gen. W. H. Harrison was nominated by the anti-Jackson groups in 1836, and in 1840 purely on the grounds of expediency he was the nominee of the Whig Party. The election of Gen. Harrison in the "log cabin and hard cider" campaign of 1840 proved a fruitless victory; the early death of the President and the anti-Whig politics of his successor, John Tyler (*q.v.*), shattered their legislative programme.

In 1844 Clay was the Whig candidate, and the annexation of Texas, involving the risk of a war with Mexico, was the leading issue. The Whigs opposed annexation and the prospect of success seemed bright, until an injudicious letter written by Clay turned the anti-slavery element against him and lost him the Presidency. The triumph of Polk in 1844 was followed by the annexation of Texas and by war with Mexico. The Whigs opposed the war largely for political reasons, but on patriotic grounds voted supplies for its prosecution. The vast territorial expansion, at the cost of Mexico, brought to the front the question of slavery in the new domain. The agitation that followed continued through the presidential election of 1848 (in which the Whigs elected Gen. Zachary Taylor), and did not subside until the passage of the "Compromise Measures of 1850" (*q.v.*). To its

authors this compromise seemed essential to the preservation of the Union; but it led directly to the destruction of the Whig Party.

In the North, the fugitive slave law grew daily more odious, but a committal of the party to the repeal of the law would have driven the Southern Whigs into the camp of the Democrats. In an endeavour to allay sectional strife, the national Whig convention of 1852, the last that represented the party in its entirety, gave to the Northern Whigs the naming of the candidate—Gen. Winfield Scott—and to the Southern the framing of the platform with its "finality" plank which committed the party to an acceptance of the laws regulating slavery as final. Two years later the repeal of the Missouri Compromise by the Kansas-Nebraska Act demonstrated that "finality" could not be maintained, and that in committing the Whig Party to the policy of its maintenance the convention of 1852 had signed the death-warrant of the party.

Cole, *The Whig Party in the South* (1913). Much valuable material can be obtained from the biographies, works, memoirs, etc., of the public men of the period.

WHINCHAT (*Saxicola rubetra*), a bird allied to the wheatear (*q.v.*) and stonechat (*q.v.*). The whinchat is a summer migrant, somewhat larger than the stonechat and preferring enclosed land. It ranges over Europe and West Asia, wintering in Africa.

WHIP, in English parliamentary usage, denotes a member, chosen by the leader or leaders of a political party for the special duty of securing the attendance of the other members of that party on all necessary occasions, the term being abbreviated from the whipper-in of a hunt. The name is also given to the summons urging members of the party to attend. Political party whips are always members of parliament, and for the party in power (*i.e.*, the government) their services are essential, seeing that the fate of an important measure, or even the existence of the government itself, may depend upon the result of a division in the House. The urgency or importance of the notice sent by the whips to their following is indicated by the number of lines underscoring the notice, a four-line whip usually signifying the extremest urgency. The chief government whip also holds the office of patronage secretary to the treasury, so called because when offices were freely distributed to secure the support of members, it was his chief duty to dispose of the patronage to the best advantage of his party. He is still the channel through which such patronage as is left to the prime minister is dispensed. He is assisted by three junior whips, who are officially appointed as junior lords of the treasury; their salaries are £1,000 a year each, while the patronage secretary has a salary of £2,000. The parties not in office have whips who are unpaid. The whips also arrange for the "pairing" of such of the members of their party as desire to be absent with those members of the opposition party who also desire to be absent. The chief whips of either party further arrange in consultation with each other the leading speakers in an important debate, and also its length, and give the list of speakers to the speaker or chairman, who usually falls in with the arrangement. They take no part in debate themselves, but are constantly present in the House during its sittings, keeping a finger, as it were, upon the pulse of the House, and constantly informing their leader of the state of the House. When any division is regarded as a strictly party one, the whips act as tellers in the division.

An interesting account of the office of whip is given in A. L. Lowell's *Government of England* (1908), vol. i. c., xxv.

WHIPPING: *see* FLOGGING.

WHIP-POOR-WILL (*Antrostomus vociferus*), so called from its cry, is an American bird about a foot long, allied to the nightjars (*q.v.*), which it resembles in habits. It is common in the eastern United States.

WHISKY or **WHISKEY,** a potable alcoholic liquor distilled from cereal grains. The term is derived from the Celtic *uisque-beatha* afterwards contracted to *usquebaugh* meaning water of life. The distillation of alcoholic beverages from fermented liquors became general throughout the whole of Europe during the 16th and 17th centuries, but, whilst in the southern grape producing countries wine is the liquor which is subjected to distillation, various types of grain are used in the north. It is of interest that in all cases, doubtless owing to their stimulating properties, the same significance attaches to the terms generally applied to strong alcoholic liquors, e.g., *eau de vie* and *aqua vitae*, and Robert Burns uses these terms synonymously. At first *usquebaugh* referred not only to the plain spirit derived from grain but also to compounded beverages prepared by the addition to the spirit of sugar and flavourings such as saffron and nutmeg.

Whiskies are sometimes classified according to their geographical origin:—Scotch, Irish and American, but the chief differences are due to the secondary products—higher alcohols, esters, aldehydes, etc.

Manufacture.—The process of manufacture may be divided into three stages:

(1) Mashing or the preparation of the liquor known as wort.
(2) The fermentation of the wort to produce the wash.
(3) Separation of the spirit from the wash by distillation.

The wort is prepared by mixing various grains with malt, the nature and proportion being subject to considerable variation. In Irish pot-still distilleries malted and unmalted barley, oats, wheat and rye are generally used, whilst for Scotch pot stills malted barley is practically the only material. In the patent still distilleries in both countries, the wort usually consists of maize, barley, rye (malted and unmalted) and oats, the first, which is seldom used in the pot still whiskies, being the principal ingredient.

The malt or mixture of malt and grain is crushed and raised to a suitable temperature with hot water, the diastase of the malt thus converting the starch into sugar. During this process other substances, the exact nature of which is not thoroughly understood, are obtained in solution. From these are derived the secondary constituents already referred to which impart to the various brands their distinctive flavour. The Scotch pot still or malt whiskies fall into four main types. (1) The Highland malts produced chiefly in the Speyside or Glenlivet district constitute one of the most popular. They possess a full ethereal flavour which affords evidence of the fact that the malt has been cured over peat fires. (2) The Lowland malts of the south, although possessed of an excellent full flavour, are not so distinctive as those produced in the north and approximate more closely in taste and smell to the patent still spirit. (3) Those produced in Islay have a particularly strong flavour, due in part to the "peated" malt, and are used to a considerable extent for blending purposes. (4) Those produced in Campbeltown are similar to the Islays but their flavour is more pronounced.

The patent still spirits do not display the great range and variety of flavour and bouquet observed in spirits of pot still origin. This is due in part to the fact that the patent stills render possible a much higher degree of rectification and also to the employment of malt which has not been cured over peat fires.

Pot Stills.—The pot stills used are not of standard design. In their most simple form they consist of a vessel in which the wash is boiled and to which is attached a pipe or "still head" to carry the vaporized ingredients of the wash to a condenser whence the distilled liquor falls into a receiver. The heat is supplied directly from a fire, or, in the more elaborate types, by means of steam coils or jackets. The neck was originally made long to prevent the boiling wash being mechanically carried over into the receiver by frothing or spraying. In effect it has a certain rectifying action condensing and returning to the retort the ingredients boiling at a higher temperature. This rectification is in many instances increased by the addition of baffle plates in the tube or small condensers so arranged that liquid condensed therein shall be returned to the retort and not passed into the receiver. This is often effected by an additional pipe or "lyne arm" connecting the rectifier with the retort. In Ireland the stills are usually larger than in Scotland, having a capacity up to 20,000 gallons. The method usually adopted, while varying in detail, is more complicated than that followed in Scotland. Three distillations take place. Strong low wines, weak low wines, strong feints and weak feints (*see* SPIRITS) are collected and the re-

sultant whisky fraction has a higher strength, viz., 24 to 30 overproof.

The still usually known as the "patent still" was in its original form devised by Aeneas Coffey in 1831. (*See* SPIRITS.) It consists essentially of two columns, the "rectifier" and the "analyser." Each column is subdivided horizontally into a series of chambers by means of perforated copper plates. The columns are filled with steam passed in at the bottom of the analyser. The wash is pumped from the "still charger" through a pipe which passes from the top of the rectifier to the bottom and then to the analyser, where it is discharged on to the first plate. In its course through the rectifier the pipe traverses each chamber twice by means of a double bend. In this way the wash is heated almost to boiling point before it is discharged, the ascending steam and vapours in the rectifier being cooled at the same time by the descending wash. The wash cannot pass through the perforations of the plates in the analyser owing to the pressure of the steam and, by an ingenious device of a safety valve and a drop pipe fitted to each plate, an inch of wash accumulates on the plates before any can be discharged to the chamber below. By the continuous upward discharge of steam through the wash the latter is gradually deprived of its alcohol and other volatile constituents which are carried with the steam back to the rectifier where they are condensed. The temperatures of the chambers of the rectifier are successively cooler from bottom to top resulting in a separation of the condensed liquor into various fractions. At one point the temperature is approximately that at which strong ethyl alcohol condenses and the chamber at this point is fitted with a special arrangement for carrying off the liquor condensed therein. In the first and last stages of the distillation the spirit collected is not of sufficient strength and is returned to the still, whilst a further device facilitates the collection of the fusel oil, which is of use in commerce. Its value has been enhanced in recent years by the demand for solvents used in cellulose lacquers. Its composition varies considerably. One examined by Dr. Bell for the royal commission on whisky contained

Amyl Alcohol	43·2%
Butyl Alcohol	33·4%
Propyl Alcohol	17·9%
Ethyl Alcohol	5·5%

Composition.—As already indicated the proportion of secondary constituents is higher in the pot still than in the patent still spirits. This is particularly the case with the "higher alcohols" and "furfural." The latter is almost invariably absent from the patent still product immediately after distillation, although a trace may be found after long storage. The proportion of these two ingredients may therefore be accepted as a basis for differentiation between the two types of spirit. The age of the spirit is an important factor.

The following values expressed in grammes per 100 litres of absolute alcohol are a summary of an extensive examination by Schidrowitz and Kaye of various types of whisky.

	Total acid	Esters	Higher alcohols	Aldehydes	Furfural	Total
Scotch pot still, average of 100 samples	30·9	60·6	143	18·6	3·2	256·3
Irish pot still, average of 6 samples	38	49	200	26	4·2	317·2
Scotch patent still, average of 4 samples	25	29	60	4·5	0·05	118·55
Irish patent still, average of 6 samples	10	28	47	2·6	trace	87·6
Irish pot still, new	6	28	233	8	4·1	279·1
The same type 13 years in plain wood cask	32	47	264	21	4·4	368·4
Scotch patent still, new	4	25	65	2	..	96
The same type 2 years in plain wood	14	25	100	5	trace	144
The same type 2 years in sherry wood	58	40	44	7	0·15	149·15

American rye whisky is prepared in Canada from rye and malt only. The following is a summary of results of analyses made by Wiley of the United States Department of Agriculture.

	Total acid	Esters	Higher alcohols	Aldehydes	Furfural	Total
New, average of 19 samples	11·4	50·6	266·4	17·8	2·4	348·6
Old, average of 76 samples	147·6	137	352	27·6	4·6	668·8

Maturation.—The alterations which take place in the character of a spirit during storage may be attributed to (*a*) the type of cask and method of storage, and (*b*) the interaction of various ingredients.

(*a*) The secondary constituents most affected by ageing—particularly in the pot still whiskies—are the volatile acids and the aldehydes. Pot still whisky is usually stored in sherry casks or in well seasoned casks which have formerly contained spirit. The wine or spirit in the cask slowly diffuses into the wood, the ethyl alcohol passing through and evaporating, whilst such ingredients as higher alcohols and esters are held. When the cask is emptied the alcohol remaining absorbed is transformed by oxidation into acids, aldehydes and esters. On the cask being refilled with the new spirit the constituents thus formed are partially extracted, particularly during the earlier period of storage. Whisky stored in bottle and commercial spirit of high strength stored in metal containers are not subject to the same alterations.

(*b*) The reactions which take place within the spirit are much more complex and difficult of explanation. They may in part be attributed to the unintentional presence of small quantities of impurities derived from external sources during the process of manufacture and dependent upon the varying conditions. Thus Thorpe found pyridine bases, allyl alcohol and allyl aldehyde probably derived from the peat, and acrolein due either to the oil extracted from the grain or to the soap which is occasionally added to the contents of the still to prevent frothing. In new pot still spirit Schidrowitz found evidence of the presence of pyrrole and phenolic and sulphurous bodies all of which would interact with the natural ingredients of the spirit to produce substances which would not otherwise be present.

Artificial maturing of spirit is sometimes attempted and various methods have been adopted, the object being to reduce the proportion of secondary ingredients, particularly aldehydes, and thus to eliminate the harshness of new spirit.

Blending.—During the past fifty years the practice of blending has gradually extended, particularly in Scotland and now very little "self-whisky" or unblended whisky is sold. It serves two purposes. (1) To produce a brand of standard flavour. This is particularly the case in the products of the pot still, the flavour of which owing to the differences in the grains of successive seasons is liable to considerable variation. (2) To meet the popular demand for a cheap mild flavoured spirit.

The best brands usually consist of approximately half Highland and Lowland malts, a small quantity of Islay and the remainder patent still spirit.

Consumption.—In common with other alcoholic beverages the consumption of whisky in Great Britain has shown a marked decline in the last few years, due partly to the increased duty on spirits and doubtless also to the change in the popular taste and habits. The following table shows the quantity in proof gallons of home made spirits retained for consumption in each part of the United Kingdom, excluding spirits delivered for methylation and other commercial uses.

	England	Scotland	Ireland	Total
1913–14	17,890,592	6,173,453	2,730,694	26,794,739
1919–20	12,548,385	3,546,247	1,731,239	17,825,871
1923–24	9,941,823	2,641,323	313,749*	12,896,895
1926–27	8,397,592	2,099,235	215,175*	10,712,002

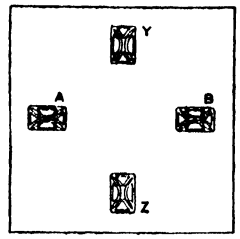
*Northern Ireland only.

During the same period the quantity per head of population fell from 0·58 to 0·24 proof gallons. The number of distilleries in Great Britain and Northern Ireland has also shown a tendency to decline, falling from 140 in 1923 to 121 in 1926. In Canada, rye whisky forms the greater proportion of the potable spirits, of which 3,924,100 proof gallons were produced in 1925 and 4,179,442 proof gallons in 1926. (F. G. H. T.)

WHISKY INSURRECTION, THE, an uprising in western Pennsylvania in 1794 against the Federal Government, occasioned by the attempted enforcement of the excise law (enacted by Congress, March 1791) on domestic spirits. The common prejudice in America against excise in any form was felt with especial strength in western Pennsylvania, Virginia and North Carolina where many small whisky stills existed. Albert Gallatin (*q.v.*) took a leading part in expressing resentment in a constitutional manner, but under the agitator David Bradford the movement soon developed into excesses.

The Federal revenue officers in, some cases were tarred and feathered; but in Sept. 1794, President Washington, using the new powers bestowed by Congress in May 1792, despatched a considerable force of militia against the rebellious Pennsylvanians, who thereupon submitted without bloodshed, the influence of Gallatin being used to that end. Bradford fled to New Orleans; some of his more prominent supporters were tried for treason and convicted, but promptly pardoned.

In American history this so-called "rebellion" is important chiefly on account of the emphasis it gave to the employment by the Federal Executive of the new powers bestowed by Congress for interfering to enforce Federal laws within the States. It is indeed inferred from one of Hamilton's own letters that his object in proposing this excise law was less to obtain revenue than to provoke just such a local resistance as would enable the central government to demonstrate its strength.



WHISPERING BELLS (*Emmenanthe penduliflora*), a North American herb of the water-leaf family (Hydrophyllaceae), known also as California yellow bells, native to mountain slopes from central California to Utah and southward to Mexico. It is a low, much-branched, sticky-hairy annual, 10 in. to 20 in. high, with deeply-cut leaves and bell-shaped, cream-coloured or yellow flowers, ½ in. long, borne on slender, pendulous stalks in loose clusters. This characteristic plant of the chaparral (*q.v.*) is grown in gardens for its showy, persistent flowers. When dry after fruiting these give forth a slight rustling sound.

WHIST, a game of cards of English origin gradually evolved from several older games which succeeded each other under the name of triumph, trump, ruff and honours, whist and swabbers, and finally whist. Whist was so called because of its requiring silence and close attention. It is believed that the earliest mention of whist is by Taylor, in 1621. In the middle of the 18th century Edmund Hoyle and others published rules and maxims for playing. However, it remained for Dr. Henry Jones, of London, whose pen name was Cavendish, to work out a complete system for scientific play. His first code was published under the title of *Whist Development* in 1863. He further improved the game and published several editions of his *Laws and Principles of Whist* and finally several editions of *Cavendish on Whist*, the 22nd being published shortly before he died.

Forming the Game.—Whist is played by four persons, two sides of two partners each, with a full pack of 52 cards, equally distributed. The partners are determined by cutting; the highest two play against the lowest two, and the lowest has the choice of cards and seats. In cutting, ace is the lowest card. There should be two packs of cards of different coloured backs, one pack being shuffled while the other is being dealt. All must cut from the same pack. Before every deal the cards must be shuffled. The dealer must present the pack to his right hand adversary to be cut; the adversary must take a portion from the top of the pack and place it toward the dealer. At least four cards must be left in each portion; the dealer must unite the two by placing the one not removed in cutting upon the other.

When the pack has been properly cut and reunited, the dealer must distribute the cards one at a time to each player in regular rotation, beginning at his left. The last card, which is the trump, must be turned face up before the dealer, where it must remain until it is his turn to play to the first trick. This card is known as the trump card and the suit to which it belongs is the trump suit; the other three suits are known as the plain suits.

The eldest hand or player on the left of the dealer opens the game by placing one of his cards face upward upon the table. The three other players each play a card to it in rotation, commencing with the second hand, or player to the left of the leader, the dealer being the last to play. Each player must follow suit, that is, play the suit that was led, if he can. If he is void of that suit he may discard or trump. The four cards thus played constitute a trick. The highest card of the suit led, or the highest trump takes the trick. The trick is taken in by the partner of the winner and placed face downward at his left hand on the table. The winner of the first trick becomes the leader to the next, and this routine is continued until all the cards are played, there being 13 tricks in all. The deal then passes to the next player on the left, and so on to each player in turn.

POSITIONS OF PLAYERS AT A WHIST TABLE, A & B BEING PARTNERS AGAINST Y AND Z, Z BEING THE DEALER

A game consists of seven points, each trick above six counting one upon the score. The cards in each suit are divided into two classes: "high" cards and "small" cards. The five high cards are ace, king, queen, jack and ten; the eight small cards are the nine to deuce inclusive.

The English Leads.—Under the English system the high cards were led without regard to the number of cards in the suit. The king was led when accompanied by the ace or queen, or both. The queen was led from the top of sequence of queen, jack and ten, and the ten was led from the combination of king, jack, ten and small cards. Having no combination in hand from which a high card could be led, the hand was opened with a small card, the smallest from a suit of four, the penultimate from a suit of five, and the antepenultimate from a suit of six or more.

The American Leads.—One of the foremost authors and players of America was Nicholas B. Trist of New Orleans. He corresponded with Cavendish (Dr. Jones) a great deal about the game, and in the course of the correspondence suggested to Jones that instead of the penultimate and antepenultimate, when opening the game with a low card, the fourth best, counting from the top, be led, and then when the card or cards smaller than the fourth best were played the number of cards originally held in that suit could be counted. Trist further suggested that they revise the high card leads to show the number in suit by the original leads as follows: from ace, king and others lead the king to show four, but lead the ace to show five or more; from king, queen and others still lead the king to show four; but lead the queen to show five or more. Cavendish approved these changes and named this new system the "American leads" in honour of the American author who suggested them. The American leads thus formulated and accepted on both sides of the Atlantic became the standard of play for all whist clubs.

Following the rules for the leads, in opening the game came the rules for the "conventional plays."

Second Hand Play.—The old English idea that second hand has nothing to do but to "play low" is not a rule of modern whist. The proper play may be a high card or a low card, depending entirely on the card led, the inferred combination from which led, the cards of that suit held, the strength or weakness of trumps. There are three things for second hand to do of importance in the order named: (*a*) Win the trick as cheaply as possible; (*b*) prevent third hand from winning too cheaply; (*c*) retain command of opponent's suit as long as advisable.

(1) On a high card led, play the lower one of any two higher cards in sequence, or ace alone on an honour led. (2) On a low card led, play a high card if holding any combination of that suit from which you would lead a high card, otherwise play low.

Third Hand Play.—In the play of third hand the main point

to have in mind is that the suit led is your partner's and you are to assist in establishing it as follows: (1) Win the trick if necessary and as cheaply as possible; (2) prevent fourth hand from winning too cheaply, thus forcing out the adverse high cards; (3) get rid of the high cards of that suit as soon as possible to prevent blocking your partner's long suit; (4) with four exactly of your partner's suit retain the lowest one to return to him when his suit is established, which will enable him to re-enter and bring in his long suit.

Fourth Hand Play.—It is the duty of fourth hand, with few exceptions, to win the trick as cheaply as possible, unless already won by your partner. Exceptions occur during the progress of the hand, when it becomes desirable to win or not to win, according to the position of the cards, either to get the lead, or to throw it for advantage.

The Trump Suit.—The trump suit has been very aptly termed the artillery of the hand, and the proper manoeuvring with this ordnance requires the greatest courage and generalship on the part of the players. However, the student will gain a sufficient knowledge of the elementary tactics required from a careful study of the following rules:—

(1) Lead trumps from six or more without regard to value.

(2) Lead trumps from five if they include two honours, or if you hold one good plain suit.

(3) Lead trumps from four if you have two strong suits, or if your own or partner's long suit is established.

(4) Lead trumps from three or less to stop an actual or impending cross-ruff (meaning that each partner is ruffing or trumping the other's suits, led alternately for that purpose) or when you can draw two of your opponent's trumps for one of yours, your partner having none.

(5) When strong in trumps give the trump signal, which is made by the high-low play, at first opportunity.

(6) With four or more trumps echo your partner's call or lead.

(7) Always return your partner's trump lead, or lead to his trump call at first opportunity.

(8) With four or more do not trump a doubtful trick. Your passing and discard will give your partner valuable information.

(9) With three trumps or less trump freely, using your short trumps to make all the tricks possible.

(10) Do not force your partner if weak in trumps yourself, but always force the adverse strong hand.

(11) Being the commanding suit there is no necessity for anxiety in "making" the high cards, as in plain suits, and you play a more backward game, generally leading fourth-best.

(12) The rule for leading is this: If the trump suit contains at least three honours or the ten with two face cards, or any seven cards, lead as in plain suits; otherwise lead fourth-best.

General Rules.—(1) Open the game by leading trumps if strong enough. If not strong enough in trumps, lead from your best long suit. If your only long suit was opened by right opponent, lead from your best short suit.

(2) Never lead a singleton as an original lead. It is more important to give correct information to your partner than to try to deceive opponents. A singleton may be led later if weak in trumps.

(3) Always lead from the top of a sequence.

(4) It is advisable to lead through the strong hand and up to the weak hand.

The Discard.—(1) The first discard should be from your weakest suit unless trumps are led or declared against you, in which case the first discard should be from your best protected suit.

(2) The discard after the first should be made to protect and strengthen the hand as much as possible.

(3) The discard of the best card of a suit signals that you hold entire command of that suit.

(4) The discard of the second best signals that you have no more of that suit.

The Finesse.—(*a*) The finesse belongs to the higher order of play and consists in the attempt to take a trick with a card lower than your highest card and not in sequence with it, trusting that no intermediate card may lie on your left.

(*b*) It is not proper to finesse in your partner's long suit, with one exception. Holding the ace and queen of his suit, play the queen on a low card led, and if it wins the trick, the ace may be returned later.

(*c*) The expediency of finessing or not can only be determined by practised players from careful observation of the cards.

The Eleven Rule.—Acting on the theory of the fourth-best led, when leading a small card, R. F. Foster, of New York, worked out and published a useful convention known as his "eleven rule," which has become the most popular addition to the rules of the game. This rule enables all players to know at once how many cards are held by the other three players that are superior to the fourth best card led, and is thus explained: By numbering all the cards of a suit from deuce to ace, the 13 would number a total of 14 (2 to 14 inclusive). When any player leads his fourth best, he has remaining in his suit just three cards higher than the one led; deduct these three from 14, the remainder is 11, being the whole number in suit, exclusive of the three known to be in the leader's hand. Therefore, to ascertain the number of cards superior to the fourth best led that are out against the leader, we have only to deduct the face value of the card led from 11, and the remainder will be the number of higher cards held by the other hands. Then the dealer's partner from his hand can tell how many cards are held by the two opponents that are superior to the card led, and by noting them as they fall, can tell when the suit is established. This valuable rule is used by all good players of both whist and auction bridge.

The Laws of Whist.—The laws are made for the comfort and convenience of all persons who want to play a good game and in the best form. The strict observance of the laws will prevent disputes and add much interest to the play. The player who is not acquainted with the laws and rules is often at a serious disadvantage and liable to commit petty errors for which the penalties are severe. The penalties are taken from the code of the laws.

The Penalties.—If dealer reshuffles the pack after it has been properly cut, he loses his deal.

There must be a new deal by the same dealer—(1) If any card except the last is placed face up in the pack; (2) if during the deal or during the play of the hand the pack is proved incorrect or imperfect. It is a misdeal:—

(1) If the dealer omits to have the pack cut.

(2) If he deals a card incorrectly and fails to correct the error before dealing another card.

(3) If he counts the cards on the table or in the remainder of the pack.

(4) If he does not deal to each player the proper number of cards and the error is not "discovered" before all have played the first trick.

(5) If he places the trump card face downward upon his own or any other player's cards.

A misdeal loses the deal unless during the deal either of the adversaries touch a card or in any other manner interrupt the dealer.

The following cards are liable to be called by either adversary.

(1) Every card faced upon the table otherwise than in the regular course of play.

(2) Every card thrown with the one led or played to the current trick.

(3) Every card so held by a player that his partner sees any portion of its face.

(4) Every card named by a player holding it.

All cards liable to be called must be left face upward upon the table. A player must lead or play them when they are called, provided he can do so without revoking.

Leading Out of Turn.—If any player leads out of turn, a suit may be called from him or his partner the first time it is the turn for either of them to lead.

Revoking.—To revoke is to renounce in error without being corrected in time. A player revokes if when holding one or more cards of the suit led, he plays a card of a different suit. The penalty for revoking is the transfer of two tricks from the revoking

side to their adversaries.

Whist or Bridge.—The game of auction bridge has become very popular all over the world in the last 25 years, and has far surpassed the game of whist, especially with the young people and in the domestic circles. Whist still holds its own, however, with the older clubs and players. The American Whist League has met in annual congress every year since its organization in 1891, meeting alternately in cities east and west.

Solo or Solo Whist is a modification of whist, the chief distinctive feature being that a single player generally has to oppose the other three. The game in America adheres to the English rules in the larger Eastern cities, but it is played very little. In the west a variation, "Slough," has superseded "Solo."

The literature of the game is now limited to *Cavendish on Whist,* in England and the *Gist of Whist,* by Charles E. Coffin, in America.

(C. E. Co.)

WHISTLER, JAMES ABBOTT McNEILL (1834–1903), painter, was born at Lowell, Mass., U.S.A., in 1834, of Irish-American parents. His grandfather emigrated to America. He belonged to a family of soldiers. At the age of 17, after spending some time in St. Petersburg (Leningrad), where his father was acting as an engineer, the painter was entered at West Point Military academy, but left because his studies proved quite unsatisfactory. After trying to enter the Navy he became a draughtsman in the Coast Survey Department at Washington. The precision of the work was, however, more than he could bear, so in 1854 he sailed to England and thence to France, in 1855, where he studied for two years in the Paris *atelier* of the then prominent painter, Charles Gabriel Gleyre. He then came to the conclusion that nothing further could be learned in such academic surroundings. Gleyre, who maintained the Ingres traditions, was accounted by Whistler a "bourgeois Greek" and when, later, the pupil offered a picture for the judgment of the official Salon, it was promptly refused. Nothing daunted in his independent spirit, he sent it to the Salon des Refusés, where it scored an unqualified success. Recognition of his genius came very tardily, England especially being extremely unsympathetic, an attitude provoked by the American's delight in mystifying the English painters, critics and public and in returning their ridicule. His contempt for the prevailing fashion was reflected in his dress, which was immaculate almost to dandyism, whilst his unpunctuality was a source of exasperation.

In painting, Whistler was closely affiliated to the French Impressionist movement. Sentiment and anecdote are nearly always absent from his work, which relies for its effect upon the sacrifice of minute detail and brilliant colouring to the exquisite arrangement of tones and upon the emphasis on the musical quality of colour. A study of his pictures will reveal the fact that, far from justifying Millais' description as "a man who had never learned the grammar of his art," he had invented a grammar more simple yet more capable of expression than anything known in the Western hemisphere, a contrast to the more favoured pre-Raphaelites.

The art of Whistler was subjected to various influences, among them those of Courbet, Velasquez, Puvis de Chavannes, Hogarth and Tintoretto, but his own personality is always uppermost. The shops of Amsterdam provided the blue and white porcelain which before the days of eager collectors adorned his paintings. He was an admirer of Japanese colour-prints which, used as packing for other articles around the year 1860, were soon imported for their own decorative virtues. Whistler used them in such pictures as "The Balcony," "La Princesse du Pays de la Porcelaine" and "The Golden Screen." The result is the perfect modification of Eastern influences by European traditions and ideals. Here was a step towards a more abstract conception of art.

Lithography, the discovery of Senefelder, was perfected by Whistler, whilst his etchings are marvels of delicacy and bear out his own contention that the area covered should be in ratio to the strength of the means employed. His condemnation of the large plate as an abomination may be regarded as an admission of his own limitations. During the greater part of his life, he produced an average of 12 etchings or lithographs each year; yet he found time to write charming prose, reflecting the meticulous care which he bestowed upon his person and surroundings. Whistler's "Ten o'clock" lecture was a statement of his convictions concerning art, and, like his "Gentle Art of Making Enemies," acted by its very brilliance as a goad to his adversaries. In 1883 Whistler exhibited 51 etchings and drypoints at the Fine Art Society, London, and in 1896, 70 lithographs were shown. During his lifetime he produced nearly 400 etchings and drypoints and probably 150 lithographs. At the Grosvenor gallery, newly opened in 1877 by Sir Coutts Lindsay, his paintings included some "nocturnes," and of the International Society he was the first president.

Whistler took the utmost care in the tones used on the floor and walls of his studios, in the dresses worn by his sitters, and even went so far as to redecorate a room in the house, at Knightsbridge, of F. R. Leyland. This room has been transferred to the Freer Museum, Washington. In 1886, Whistler was elected President of the Royal Society of British Artists. His failure to be re-elected caused no surprise. He remarked that "the artists had come out and the British had remained."

But the British Museum bought his etchings and he was the recipient of honours from nearly every foreign Government. A deep religious sympathy is evident in his paintings of "Miss Alexander" and "Carlyle." He died in London on July 17, 1903, at the age of 69 years.

To Whistler must be credited the full realization of the analogy between music and colour in their powers of expression. He described his pictures as symphonies, harmonies, nocturnes and so forth, instead of adopting the story-telling titles or doggerel verse then usually employed. This new nomenclature caused at first much resentment and derision, but is to-day accepted as perfectly natural and appropriate. The values, or degrees of tone were, to this sensitive painter, almost the beginning and end of art. He was painfully aware of his weakness as a draughtsman, which deprived his drawing of that sureness which proclaims a master of line. Whistler held that a good arrangement of simple masses provides the most important features of a picture, and that attention to tone values ensures serenity, which a study of Velasquez, who always used a severely restricted palette, will reveal. He may also have been attracted to Vermeer of Delft, whose work possesses the same quality of quiet dignity. He considered, too, that to avoid completely any feeling of interruption, pre-Raphaelite detail must be shunned; and that, even in tone arrangements, extremes were not advisable for fear of over-accentuation. Thus many of his first paintings are executed in a middle key. Towns, where the atmosphere is often slightly thick and quiet greys prevail, have been the source of inspiration for many a "tone-painter" since Whistler produced his delightful Thames pictures.

BIBLIOGRAPHY.—Whistler's *The Gentle Art of Making Enemies* was published by the Ballantyne Press in 1890. The following catalogues of his paintings, etc., may be consulted: *Catalogue of Whistler Memorial Exhibition* (1905); H. Mansfield, *Descriptive Catalogue of Etchings and Drypoints of J. A. M. Whistler* (Chicago, Caxton Club, 1909); F. N. Levy, *Catalogue of Paintings in Oil and Pastel by J. A. M. Whistler* (Metropolitan Museum of Art, N.Y., 1910); *Catalogue of Works by J. A. M. Whistler,* with a bibliography (Victoria and Albert Museum); *Whistleriana* (Freer Gallery of Art, Washington, 1928). For biography and criticism *see:* H. Beraldi, *Les Graveurs du XIXe Siècle,* vol. xii. (1892); Sir Frederick Wedmore, *Whistler's Etchings* (1899); R. Way and G. R. Dennis, *The Art of James McNeill Whistler,* 2 vols. (1903), and *Memories of James McNeill Whistler, the Artist* (1912); Menpes, *Whistler as I Knew Him* (1904); A. Jerome Eddy, *Recollections and Impressions of James A. McNeill Whistler* (1903); T. Duret, *Histoire de J. A. M. Whistler et de son oeuvre* (1904); J. and E. R. Pennell, *The Life of James McNeill Whistler* (1908); E. G. Kennedy, *The Etched Work of Whistler* (Grolier Club, New York, 1910); Don C. Seitz, *Writings by and about Whistler: a Bibliography* (Edinburgh, 1910); A. Alexandre, "J. McNeill Whistler," *Les Arts* (Sept. 1903); A. E. Gallatin, *Whistler's Pastels, and other Modern Profiles* (1913), and *Portraits of Whistler: a Critical Study and Iconography* (1918).

WHITAKER, JOSEPH (1820–1895), English publisher, was born in London on May 4, 1820. In January 1858 he started the *Bookseller,* and in 1869 published the first issue of *Whitaker's Almanack,* the annual work of reference, which also met with

immediate success. In 1874 he published the first edition of the *Reference Catalogue of Current Literature*. Whitaker died at Enfield on May 15, 1895.

WHITBREAD, SAMUEL (1830–1915), English politician, born at Cardington, Beds., on May 5, 1830, the grandson of Samuel Whitbread, M.P. for Bedfordshire, was head of the brewery founded by his great-grandfather from 1867 to 1889, and then became chairman of the company to which it was transferred. Like his father and grandfather, he became Liberal M.P. for Bedford (1852–95). He died at Biggleswade on Dec. 25, 1915.

WHITBY, a market-town in Yorkshire, England. Pop. (1921), 12,510. The town is situated on the cliff-bound north-east coast, at the mouth of the river Esk, which follows a wooded course almost due east through the open, high-lying moors. The old town of narrow streets and picturesque houses stands on the steep slopes above the river, while the modern residential quarter is mainly on the summit of the west cliff. On the east cliff, which dominates the harbour, called of old Streoneshalh, the ruins of the famous abbey hold a commanding position. The existing ruins comprise parts of the Early English choir, the north transepts of slightly later date, and a richly Decorated nave. The west side of the nave fell in 1763 and the tower in 1830. On the south side are the foundations of cloisters and domestic buildings. Extensive excavations are being carried out in the castle ruins.

Whitby is first mentioned by Bede, who states that a religious house was founded here in about 657. It included establishments for monks and, until the Conquest, for nuns of the Benedictine order, and under Abbess Hilda it acquired considerable celebrity. In the 9th century the town was destroyed by the Danes, but was later refounded and became the centre of a Danish colony; it was the most prosperous town in the district until laid waste by the Conqueror. Henry I. made a grant of a burgage to the abbot and convent of Whitby and, towards the end of the 12th century, the abbot granted the town a free burgage to the burgesses. In 1200, King John, bribed by the burgesses, confirmed this charter, but the following year, on being bribed by the abbot, he quashed it as injurious to the dignity of the church of Whitby. The struggle continued until the 14th century, when a trial resulted in judgment against the burgesses. In 1629, Whitby petitioned for incorporation on the ground that the town was in decay through lack of good government, and received letters patent giving it self-government. But in 1674–75 the Crown restored to the lords of the manor all liberties ever enjoyed by the abbots of Whitby in Whitby and Whitby Strand, probably in gratitude for the part they played in the Civil War.

Whitby has been a port at least since the 12th century, ranking seventh in England in 1828. Here were constructed the ships for Captain Cook's voyages. The yard was used for building ferro-concrete boats during the World War. Wooden ships are still built, and rope and sail making are carried on. In mediaeval times herrings and cod from the North sea formed the only industries. Whale fishing began in 1753.

The manufacture of alum from rocks near Whitby was an important industry from the beginning of the 17th century to well into the 19th century. The Yorkshire Lias was the sole source in England. With the development of Cleveland iron, the trade declined, but alum is manufactured for medicines, tanning and dyeing. Jet was also mined.

Adjoining the abbey is Whitby Hall, built about 1580 from the materials of the monastic buildings, and enlarged and fortified about 1635. A little below the abbey is the parish church of St. Mary, originally Norman, but much altered. The geological and antiquarian museums at Whitby are famous.

WHITCHURCH, urban district, north Shropshire, England. Pop. (1921) 5,653. Whitchurch is mentioned as a borough in the 14th century. The parish extends into Cheshire. Whitchurch was famous for its turret clocks, many of those in the churches of N. Shropshire having been made there.

WHITE, ANDREW DICKSON (1832–1918), American educationalist and diplomat, was born in Homer (N.Y.) on Nov. 7, 1832. He graduated at Yale (A.B.) in 1853, studied at the Sorbonne in 1854, and at the University of Berlin in 1855–56, meanwhile serving as attaché at the U.S. Legation at St. Petersburg in 1854–55. He was professor of history and English literature in 1857–63, and lecturer on history in 1863–67 at the University of Michigan. He dreamed of a great university with professors in every field, rich libraries and museums and stately buildings, the whole free from denominational control, open to men and women alike. After approaching various men of wealth, his alliance during his State senatorship (1864–67) with Ezra Cornell, who promised to give such an institution a site and $500,000 endowment, enabled him with the addition of the New York land-grant, to establish at Ithaca (N.Y.) the present Cornell university, to which as first president and after 1885 as a member of the board of trustees and executive committee he devoted his best energies and much of his wealth. He combined in an unusual degree the qualities of scholar and man of affairs. He served on the commission to Santo Domingo, and on the commission on the Venezuela boundary, as United States minister to Germany in 1879–81 and to Russia in 1892–94, and as ambassador to Germany in 1897–1903. In 1899 he was president of the American delegation at The Hague Peace Conference. Although Dr. White listed numerous unfinished projects in his *Autobiography* (1905), his various activities did not prevent him from completing several works. The most outstanding are *A History of the Warfare of Science with Theology in Christendom* (1896), and *Seven Great Statesmen in the Warfare of Humanity with Unreason* (1910). He died at Ithaca (N.Y.) on Nov. 4, 1918. The Cornell school of history and political science appropriately bears his name, and the rich collection of books which he gave the university is housed in a special room in the main library.

WHITE, EDWARD DOUGLASS (1845–1921), American jurist, was born on a plantation in the parish of Lafourche, La., Nov. 3, 1845, his father being 7th governor of Louisiana. He was educated at Mount St. Mary's, Md., Georgetown, D.C., college, and, after the outbreak of the Civil War, at the Jesuit college in New Orleans. During the latter part of the war he served as a private in the Confederate army. He studied law in the office of Edward Bermudez, later chief justice of Louisiana, was admitted to the bar in 1868, and practised law in New Orleans. In 1874 he was elected to the State senate, and four years later was appointed associate justice of the Louisiana supreme court. In 1891 he was elected to the U.S. Senate, and before completing his term was appointed, in 1894, associate justice of the U.S. Supreme Court by President Cleveland. In 1910 he was appointed chief justice by President Taft.

Many of his notable opinions were delivered in connection with the Sherman anti-trust law. Of special importance were his opinions requiring the dissolution of the Standard Oil Company and the American Tobacco Company in 1911. As chief justice he administered the oath of office to President Wilson in 1913 and 1917, and to President Harding in 1921. He died at Washington, D.C., May 19, 1921.

WHITE, SIR GEORGE STUART (1835–1912), British field marshal, was born in County Antrim on July 6, 1835. He was educated at Sandhurst, and in 1853 joined the Inniskillings, with which regiment he served in India during the Mutiny in 1857. In the second Afghan War (1878–80) he was second in command of the Gordon Highlanders, whom he led in their charge at the battle of Charasiah, receiving the Victoria Cross. In 1881 in command of the Gordon Highlanders, he took part in the Nile Expedition of 1884–85. As brigadier in the Burmese War (1885–87) he rendered distinguished service, and was promoted major-general; when Sir Frederick (afterwards Lord) Roberts left Burma in 1887, White was left in command of the force charged with the duty of suppressing the dacoits and pacifying the country. This he accomplished with a thoroughness which earned the thanks of the government of India. He was in command of the Zhob expedition in 1890, and in 1893 he succeeded Lord Roberts as commander-in-chief in India; and during his tenure of this office directed the conduct of the Chitral expedition in 1895 and the Tirah campaign in 1897. Returning to England in 1898 he became quartermaster-general of the forces; and on the outbreak of the Boer War in 1899 he was given command of the forces in

Natal. He defeated the Boers at Elandslaagte on Oct. 21, 1899, and at Reitfontein on the 24th; but the superior numbers of the Boers enabled them to invest Ladysmith, which Sir George White defended in a siege lasting 119 days, from Nov. 2, 1899 to March 1, 1900, in the course of which he refused to entertain Sir Redvers Buller's suggestion that he should arrange terms of capitulation with the enemy. (*See* LADYSMITH, SIEGE AND RELIEF OF.) After the relief of Ladysmith, White, whose health had been impaired by the siege, returned to England, and was appointed governor of Gibraltar (1900–1904). King Edward VII., who visited the fortress in 1903, personally gave him the baton of a field marshal. In 1905 Sir George White was appointed governor of Chelsea Hospital, and decorated with the Order of Merit. He died in London on June 24, 1912.

See T. F. G. Coates, *Sir George White* (1900).

WHITE, GILBERT (1720–1793), English writer on natural history, was born on July 18, 1720, at Selborne, Hants. He was educated at Basingstoke under Thomas Warton, father of the poet, and at Oriel College, Oxford, where in 1744 he was elected to a fellowship. Ordained in 1747, he became curate at Swarraton the same year and at Selborne in 1751. In 1752 he was nominated junior proctor at Oxford and became dean of his college. In 1753 he accepted the curacy of Durley, and afterwards received the college living of Moreton Pinkney, though he did not reside there. In 1761 he became curate at Faringdon, near Selborne, and in 1784 he again became curate in his native parish. He died in his home, The Wakes, Selborne, on June 26, 1793.

Gilbert White's daily life was practically unbroken by any great changes or incidents; for nearly half a century his pastoral duties, his watchful country walks, the assiduous care of his garden, and the scrupulous posting of his calendar of observations made up the essentials of a full and delightful life. His four brothers were all interested in science, and White corresponded with the chief botanists and antiquarians of his time. In 1771 he sketched out to Thomas Pennant the project of "a natural history of my native parish, an *annus historico-naturalis*, comprising a journal for a whole year, and illustrated with large notes and observations. Such a beginning might induce more able naturalists to write the history of various districts and might in time occasion the production of a work so much to be wished for—a full and complete natural history of these kingdoms." Yet the famous *Natural History and Antiquities of Selborne* did not appear until 1789. It was well received and is constantly reprinted.

White's is the first book which raised natural history into the region of literature, much as the *Compleat Angler* did for angling. Its charm lies in the sweet and kindly personality of the author, who on his rambles gathers no spoil, but watches the birds and field-mice without disturbing them from their nests, and quietly plants an acorn where he thinks an oak is wanted, or sows beechnuts in what is now a stately row. The encyclopaedic interest in nature, although in White's day culminating in the monumental synthesis of Buffon, was also disappearing before the analytic specialism inaugurated by Linnaeus; yet the catholic interests of the simple naturalist of Selborne fully reappear a century later in the greater naturalist of Down, Charles Darwin.

The *Life and Letters of Gilbert White of Selborne*, by his great grandnephew, Rashleigh Holt-White, appeared in 1901.

WHITE, HENRY KIRKE (1785–1806), English poet, was born at Nottingham, the son of a butcher, on March 21, 1785. He was articled to a lawyer. Capel Lofft encouraged him to publish *Clifton Grove, a Sketch in Verse, with other Poems*, dedicated to Georgiana, duchess of Devonshire. The book was violently attacked in the *Monthly Review* (Feb. 1804), but White was in some degree compensated by a kind letter from Robert Southey. Through the efforts of his friends, he was entered as a sizar at St. John's college, Cambridge, spending a year beforehand with a private tutor. Close application to study induced a serious illness, and fears were entertained for his sanity, but he went into residence at Cambridge, with a view to taking holy orders, in the autumn of 1805. The strain of continuous study proved fatal, and he died on Oct. 19, 1806. He was buried in the church of All Saints, Cambridge. Much of his fame was due to sympathy inspired by his early death, but Byron agreed with Southey in forming a high estimate of the young man's promise.

His *Remains*, with his letters and an account of his life, were edited (3 vols., 1807–22) by Robert Southey. *See* prefatory notices by Sir Harris Nicolas to his *Poetical Works* (new ed., 1866) in the "Aldine Edition" of the British poets; by H. K. Swann in the volume of selections (1897) in the *Canterbury Poets;* and by John Drinkwater to the edition in the "Muses' Library." *See* also J. T. Godfrey and J. Ward, *The Homes and Haunts of Henry Kirke White* (1908).

WHITE, HUGH LAWSON (1773–1840), American statesman, was born in Iredell county (N.C.), Oct. 30, 1773. In 1787 he crossed the mountains into East Tennessee (then a part of North Carolina) with his father, James White (1737–1815). Hugh became in 1790 secretary to Governor William Blount, and in 1792–93 served under John Sevier against the Creek and Cherokee Indians, and according to the accepted tradition, killed with his own hand the Cherokee chief, Kingfisher. He studied in Philadelphia, and in 1796 he was admitted to the bar at Knoxville. He was a judge of the superior court of Tennessee (1801–07), a State senator (1807–09), and (1809–15) was judge of the newly organized supreme court of errors and appeals of the State. From 1812 to 1827 he was president of the State Bank of Tennessee, the only western bank that in the trying period during and after the War of 1812 did not suspend specie payments. In 1821–24 he was a member of the Spanish Claims Commission and in 1825 succeeded Andrew Jackson in the U.S. Senate, serving until 1840 and being president *pro tem.* in 1832–34. In the Senate he supported in general the measures of President Jackson, though his opposition to the latter's indiscriminate appointments caused a coolness between himself and Jackson. In 1830, as chairman of the committee on Indian affairs, he secured the passage of a bill looking to the removal of the Indians to land west of the Mississippi. He was opposed to Van Buren, Jackson's candidate for the presidency in 1836, was himself nominated in several States as an independent candidate, and received the 26 electoral votes of Tennessee and Georgia. About 1838 he became a Whig in politics, and when the Democratic legislature of Tennessee instructed him to vote for Van Buren's sub-treasury scheme he objected and resigned (Jan. 1840). His strict principles and his conservatism won for him the sobriquet of "The Cato of the United States Senate." He died at Knoxville, April 10, 1840.

See Nancy N. Scott (ed.) *A Memoir of Hugh Lawson White* (Philadelphia, 1856).

WHITE, STANFORD (1853–1906), American architect, was born in New York city on Nov. 9, 1853. He was the son of Richard Grant White. He worked in Boston with Henry H. Richardson, whom he helped in designing Trinity church, of that city. In 1878 he went abroad for further study, particularly of the Gothic tradition in which he found his keenest satisfaction. In 1881 he became a member of the firm of McKim, Mead and White, New York city. He designed the Washington arch in Washington Square, the Century and Metropolitan clubs, the Tiffany and Gorham buildings, New York city, and the buildings of the New York university and the University of Virginia. He designed the pedestals for several of the statues of Augustus St. Gaudens, whose close friend he was, and a number of memorial monuments and stained glass windows. He was murdered by Harry Thaw in New York city, June 25, 1906. See *American Artists* by Royal Cortissoz, p. 299; *Sketches and Designs by Stanford White:* ed. Lawrence Grant White (1920), also *Letters of Stanford White*, vol. 30, *Architectural Record.*

WHITE, SIR THOMAS (1492–1567), founder of St. John's College, Oxford, was a son of William White, a clothier, and was born at Reading. He became a merchant in London and a member, and then master of the Merchant Taylors' Company; growing wealthier he became an alderman and sheriff of the city of London. One of the promoters of the Muscovy Company, he was knighted in 1553, and chosen lord mayor. He defended the city against Sir Thomas Wyat and his followers, and took part in the trial of the rebels, as he had done in the case of Lady Jane Grey. In 1555 White received a licence to found a college at Oxford, which, dedicated to the Virgin Mary and St. John Baptist, was opened in 1560. He died at Oxford on Feb. 12, 1567, and was buried

in the chapel of St. John's College. White had some share in founding the Merchant Taylors' School in London.

WHITE, WILLIAM ALLEN (1868–), American journalist, born at Emporia, Kansas, Feb. 10, 1868. He attended the University of Kansas but left to edit the El Dorado *Republican.* In 1891 he went to Kansas City and became an editorial writer on the *Star* and in 1895 purchased the Emporia *Daily* and *Weekly Gazette.* An editorial written in 1896 entitled "What's the Matter with Kansas?", an impassioned plea against populism, made him and his paper nationally known. He refused to run for political office. Three books of short stories, *The Real Issue* (1896), *The Court of Boyville* (1899), *Strategems* and *Spoils* (1901), and a volume of sketches, *In Our Town* (1906), gave him wide reputation as an interpreter of life in the country towns of the Middle-West. In 1909 he published his first novel, *A Certain Rich Man,* which passed through many editions. Then followed *The Old Order Changeth* (1910), political essays; *God's Puppets* (1916), short stories, and *In the Heart of a Fool* (1918), another successful novel. Turning to interpretative biography, he wrote a *Life of Woodrow Wilson* (1924), *Calvin Coolidge, the Man Who is President* (1925), and *Masks in a Pageant* (1928). Many of his best editorials are collected in *The Editor and His People* (1924). He was sent to France by the American Red Cross as an observer in 1917, was a delegate to the Russian Conference at Prinkipo, 1919, and is a director of the Rockefeller Foundation, Woodrow Wilson Foundation and Walter Hines Page Foundation.

WHITE, WILLIAM HALE (1829–1913): *see* RUTHERFORD, MARK.

WHITE, SIR WILLIAM HENRY, K.C.B., 1895 (1845–1913), English naval architect, was born at Devonport on Feb. 2, 1845, and at 14 became an apprentice in the dockyard there. After spending three years at the Royal School of Naval Architecture, South Kensington, he joined the constructive staff of the Admiralty, and acted as confidential assistant to the chief constructor, Sir Edward Reed, until Reed's retirement. In 1872 White was appointed secretary to the Council of Construction at the Admiralty, in 1875 assistant constructor, and in 1881 chief constructor. In April 1883 he left the service of the Admiralty, at the invitation of Lord (then Sir W. G.) Armstrong, to organize a department for the construction of warships of the largest size at the Elswick works. In October 1885 he returned to the Admiralty as director of naval construction, retaining that post until the beginning of 1902. More than 200 vessels of various types were added to the British navy, at a total cost of something like 100 millions sterling, and for the design and construction of these ships White was ultimately responsible. In addition to his work at the Admiralty, he was professor of naval architecture at the Royal School from 1870 to 1873, and when in the latter year it was moved to Greenwich to be merged in the Royal Naval College, he reorganized the course of instruction and acted as professor for eight years more. His *Manual of Naval Architecture* is a standard text-book. White, who was elected F.R.S. in 1888, read many professional papers before various learned and engineering societies. He died in London on Feb. 27, 1913.

WHITE ANT: *see* TERMITE; SOCIAL INSECTS.

WHITEBAIT (Fr. *Blanchaille*), the name given to the fry of the herring and sprat, and formerly erroneously thought to be a distinct species, *Clupea alba.* These young fish, which are much esteemed for the table, are found in large numbers in estuaries (Firth of Forth, Thames, etc.) and at certain times along the coast, but it appears that the large concentrations which make the fishery a commercial success occur only in estuaries.

In spite of the large numbers of whitebait caught, it is improbable that this has any noticeable effect on the subsequent herring fisheries. In the year 1926, 3,127cwt. of whitebait were landed in ports of England and Wales, and sold for £3,916.

WHITEFIELD, GEORGE (1714–1770), English religious leader, was born on Dec. 16, 1714, at the Bell Inn, Gloucester, of which his father was landlord. At fifteen he was taken from school to assist his mother in the public-house, and for a year and a half was a common drawer. He then again returned to school to prepare for the university, and in 1733 entered as a servitor at Pembroke College, Oxford, graduating in 1736. There he came under the influence of the Methodists (*see* WESLEY).

In 1736 he was invited by Wesley to go out as missionary to Georgia, and went to London to wait on the trustees. Before setting sail he preached in some of the principal London churches, and in order to hear him, crowds assembled at the church doors long before daybreak. On Dec. 28, 1737, he embarked for Georgia, which he reached on May 7, 1738. After three months' residence there he returned to England to receive priest's orders, and to raise contributions for the establishment of an orphanage. As the clergy did not welcome him to their pulpits, he began to preach in the open air. At Kingswood Hill, Bristol, his addresses to the colliers soon attracted crowds, and his voice was so clear and powerful that it could reach 20,000 folk. His fervour and dramatic action held them spell-bound, and his homely pathos soon broke down all barriers of resistance. "The first discovery of their being affected," he says, "was by seeing the white gutters made by their tears, which plentifully fell down their black cheeks." He again embarked for America in August 1739, and remained there two years, preaching in all the principal towns. He left his incumbency of Savannah to a lay delegate, and was suspended for ceremonial irregularities.

During his absence from England Whitefield found that a divergence of doctrine from Calvinism had been introduced by Wesley; and notwithstanding Wesley's exhortations to brotherly kindness and forbearance he withdrew from the Wesleyan Connexion. Thereupon his friends built for him near Wesley's church a wooden structure, which was named the Moorfields Tabernacle. A reconciliation between the two great evangelists was soon effected, but each thenceforth went his own way. In 1741, on the invitation of Ralph and Ebenezer Erskine, he paid a visit to Scotland, commencing his labours in the Secession meeting-house, Dunfermline. But, as he refused to limit his ministrations to one sect, the Seceders and he parted company, and without their countenance he made a tour through the principal towns of Scotland, and was everywhere received with enthusiasm. From Scotland he went to Wales, where on Nov. 14, he married a widow named James. The marriage was not a happy one. On his return to London in 1742 he preached to the crowds in Moorfields during the Whitsun holidays. After a second visit to Scotland, June–October 1742, and a tour through England and Wales, 1742–1744, he embarked in August 1744 for America, where he remained till June 1748. On returning to London he found his congregation at the Tabernacle dispersed; and his circumstances were so depressed that he was obliged to sell his household furniture to pay his orphan-house debts. Relief soon came through his acquaintance with Selina, countess of Huntingdon (*q.v.*), who appointed him one of her chaplains.

The remainder of Whitefield's life was spent chiefly in evangelizing tours in Great Britain, Ireland and America. It has been stated that "in the compass of a single week, and that for years, he spoke in general forty hours, and in very many sixty, and that to thousands." In 1748 the synods of Glasgow, Perth and Lothian passed vain resolutions intended to exclude him from churches; in 1753 he compiled his hymn-book, and in 1756 opened the chapel which bears his name in Tottenham Court Road, London. On his return from America to England for the last time the change in his appearance forcibly impressed Wesley, who wrote in his *Journal*: "He seemed to be an old man, being fairly worn out in his Master's service, though he had hardly seen fifty years." When health was failing him he placed himself on what he called "short allowance," preaching only once every week-day and thrice on Sunday. In 1769 he returned to America for the seventh and last time, and arranged for the conversion of his orphanage into Bethesda College, which was burned down in 1773. He died on Sept. 30, 1770, at Newburyport, Mass. He was buried before the pulpit in the Presbyterian church of the town where he died.

Whitefield's printed works convey a totally inadequate idea of his oratorical powers, and are all in fact below mediocrity. They appeared in a collected form in 1771–72 in seven volumes, the last containing *Memoirs of his Life,* by Dr. John Gillies. His *Letters* (1734–70)

were comprised in vols. i., ii. and iii. of his *Works* and were also published separately. His *Select Works*, with a memoir by J. Smith, appeared in 1850. See *Lives* by Robert Philip (1837), L. Tyerman (2 vols., 1876–77), J. P. Gledstone (1871, new ed. 1900), and W. H. Lecky's *History of England*, vol. ii. (1878–90).

WHITEFISH, the name of fishes of the genus *Coregonus* of the salmon family. These are silvery fishes with rather large scales, and with a small toothless or feebly toothed mouth; they feed on minute crustaceans. Marine species, entering rivers to breed, are chiefly arctic, but a number of fresh-water species inhabit Europe and North America, especially in lakes. Few species of *Coregonus* reach a length of more than 18 inches.

For the British species *see* GWYNIAD, POLLAN and VENDACE; *see* also SALMON AND SALMONIDAE.

WHITEHALL, a village of Washington county, New York, U.S.A., at the head (south end) of Lake Champlain, 65 m. N. by E. of Albany. It is on Federal highway 4, is served by the Delaware and Hudson railway and is the northern terminus of the State Barge Canal system. Pop. (1920) 5,258 (88% native white). In 1786 the village was named Whitehall and in 1806 it was incorporated. During the War of 1812 it was fortified and was a base of supplies for operations against Canada.

WHITEHAVEN, seaport, market town, municipal borough, Whitehaven parliamentary division, Cumberland, England, 41 m. S.W. of Carlisle on the L.M.S. railway. Pop. (1921) 19,535. At the mouth of a river, the harbour is protected by two piers. It has a large dock and a tidal harbour and extensive quayage. Regular summer communications are maintained with the Isle of Man. The exports are principally coal, pig iron and ore, steel and stone. There are collieries near the town, the workings extending beneath the sea; there are also iron-mines and works, engineering works, and shipbuilding yards. From 1832 until 1918 it was a parliamentary borough returning one member.

Whitehaven (*Witofthaven*) was a possession of the priory of St. Bee which became crown property at the dissolution of the religious houses. It was acquired before 1644 by relatives of the earl of Lonsdale, who secured the prosperity of the town by working the coal-mines. From 1708 the harbour was governed by 21 trustees, whose power was extended by frequent legislation, until, in 1885, they were incorporated. In 1894 a municipal corporation was created by charter in that year. The harbour was entrusted to 15 commissioners.

WHITEHEAD, ROBERT (1823–1905), English inventor, was born at Bolton-le-Moors, Lancashire, on Jan. 3, 1823, the son of James Whitehead, owner of a cotton-bleaching business. In 1837 he was apprenticed to a firm of engineers in Manchester, and in 1844 joined his uncle at the works of Philip Taylor and Sons, Marseilles. In 1847 he set up a business of his own in Milan, later joining the staff of the Austrian Lloyd Company at Trieste, where he was manager from 1850 to 1856. In 1856 he began to work for the Stabilimento Tecnico Fiumano, building several Austrian warships, and carrying out preliminary experiments for the Whitehead torpedo, completed in 1866. In 1872 Whitehead bought the Stabilimento Tecnico Fiumano, converting the works entirely to the production of torpedoes and their accessories. (*See* TORPEDO.) In 1876 he improved his torpedoes with the "servo-motor," and gradually increased their speed. His work was perfected in 1896 by Obry's invention, subsequently acquired and improved by Whitehead, of the gyroscope, which guaranteed precision of aim.

See G. E. Armstrong, *Torpedoes and Torpedo Vessels* (1901).

WHITEHEAD, WILLIAM (1715–1785), English poet-laureate, son of a baker, was born at Cambridge, and baptized on Feb. 12, 1715. His father had extravagant tastes, and spent large sums in ornamenting a piece of land near Grantchester, afterwards known as "Whitehead's Folly." William was educated at Winchester college and Clare Hall, Cambridge. He became a fellow of Clare in 1742. At Cambridge Whitehead published an epistle "On the Danger of writing Verse" and other poems. In 1757 he was appointed poet-laureate in succession to Cibber. Whitehead's most successful play was the *School for Lovers* (Drury Lane, Feb. 10, 1762). David Garrick then made him his reader of plays. Whitehead died on April 14, 1785. He collected his *Plays and Poems* in 1774.

See memoirs by his friend William Mason, prefixed to a complete edition of his poems (York, 1788). His plays are printed in Bell's *British Theatre* (vols. 3, 7, 20) and other collections, and his poems appear in Chalmers's *Works of the English Poets* (vol. 17) and similar compilations.

WHITE HORSE, VALE OF, the name of the valley of the Ock, which joins the Thames from the west at Abingdon, Berkshire, England. The vale is flat and well wooded, its green meadows and foliage contrasting with the bald summits of the White Horse hills on the south. On the north a lower ridge separates it from the upper Thames valley; but local usage sometimes extends the vale to cover all the ground between the Cotswolds (on the north) and the White Horse hills. Wantage is the only town in the heart of the vale, but upon the hills villages are numerous. Towards the west, above Uffington, the hills reach a culminating point of 856 ft. in White Horse hill. In its northern flank, a gigantic figure of a horse is cut, the turf being removed to show the white chalky sub-soil beneath. This figure gives name to the hill, the range and the vale. It is 374 ft. long and of the rudest outline, the neck, body and tail varying little in width. Its origin is unknown. The figure, with others of a similar character elsewhere in England, is considered to be of high antiquity, dating from before the Roman occupation. Many ancient remains occur in the vicinity of the Horse. On the summit of the hill there is an extensive and well-preserved circular earthwork known as Uffington castle. Within a short distance are Hardwell castle, a square work, and, near Ashdown park, a small camp traditionally called Alfred's. A smooth, steep gully on the north flank of White Horse hill is called the Manger, and to the west of it rises a bald mound named Dragon's hill. The name, properly Pendragon, is a Celtic form signifying "chief of kings," and may point to an early place of burial. To the west of White Horse hill lies a dolmen called Wayland Smith's cave. The White Horse itself has been carefully cleared of vegetation from time to time, and the process, known as the "Scouring of the White Horse," was formerly made the occasion of a festival. A grassy track represents the ancient road or Ridge Way along the crest of the hills and other earthworks in addition to those near the White Horse overlook the vale, such as Letcombe castle above Wantage. Among interesting village churches in the vale is the fine Early English one at Uffington. The length of the vale is traversed by the main line of the G.W. railway, between Didcot and Swindon.

WHITE LEAD: *see* LEAD.

WHITELEY, WILLIAM (1831–1907), English "Universal Provider," was born at Agbrigg, near Wakefield, Yorkshire, on Sept. 29, 1831, the son of a corn-factor. In 1851 he made his first visit to London to see the Great Exhibition, and in 1852 he obtained a situation in a draper's establishment in the city. In 1863 he himself opened a small shop for the sale of fancy drapery in Westbourne Grove, Bayswater, London. He made a consistent practice of marking all goods in plain figures and of "dressing" his shop-window attractively, both unusual features in the retail trading of the time, and to this, coupled with the fact that he was satisfied with small profits, he largely attributed a success in which his own genius for organization and energy played a conspicuous part. In 1866 Whiteley added general drapery to his other business, opening by degrees shop after shop and department after department, till he was finally enabled to call himself the "Universal Provider," and boast that there was nothing which his stores could not supply. "Whiteley's" was, in fact, the first great instance of a large general goods store in London, held under one man's control. In 1899 the business, of which the profits then averaged over £100,000 per annum, was turned into a limited liability company, Whiteley retaining the bulk of the shares. On Jan. 23, 1907, he was shot dead, after an interview in his private office, by Horace George Rayner, who claimed (but, as was proved, wrongly) to be his illegitimate son and who had been refused pecuniary assistance. Rayner was convicted of murder, but the death-sentence was commuted to penal servitude.

WHITELOCKE, BULSTRODE (1605–1675), English lawyer and parliamentarian, eldest son of Sir James Whitelocke

(*q.v.*), was baptized on Aug. 19, 1605, and educated at Merchant Taylors' school and at St. John's college, Oxford, where he matriculated on Dec. 8, 1620. He was called to the bar in 1626 and chosen treasurer in 1628. He was M.P. for Stafford in the parliament of 1626 and had been appointed recorder of Abingdon and Henley. In 1640 he was chosen member for Great Marlow in the Long Parliament. He took a prominent part in the proceedings against Strafford. He drew up the bill for making parliaments indissoluble except by their own consent, and supported the Grand Remonstrance and the action taken in the Commons against the illegal canons; on the militia question, however, he advocated a joint control by king and parliament. On the outbreak of the Great Rebellion he took the side of the parliament. He was sent to the king at Oxford in 1643 and 1644 to negotiate terms, and the secret communications with Charles on the latter occasion were the foundation of a charge of treason brought against Whitelocke and Denzil Holles (*q.v.*) later. He was again one of the commissioners at Uxbridge in 1645. Nevertheless, he opposed the policy of Holles and the peace party and the proposed disbanding of the army in 1647, repudiated the claims of divine authority put forward by the Presbyterians for their Church, and approved of religious tolerance. He thus gravitated towards Cromwell and the army party. Under the Commonwealth he was nominated councillor of State and became a commissioner of the New Great Seal. In 1653 he went on a mission to Christina, queen of Sweden, to conclude a treaty of alliance and to secure the freedom of the Sound. On his return he again became a commissioner of the Great Seal, and also a commissioner of the Treasury. In 1654 and 1656 he sat as M.P. for Buckinghamshire.

As a lawyer, Whitelocke supported a bill introducing the use of English into legal proceedings, drafted a new treason law, and introduced modifications into chancery procedure. His resistance to the ill-considered changes in the court of chancery proposed by Cromwell and the council, however, led to his dismissal from the commissionership of the Great Seal. He still advised Cromwell on foreign affairs, and was chairman of the committee to urge Cromwell to accept the crown. In Dec. 1657 he became a member of the new House of Lords. He was again a commissioner of the Great Seal under Richard Cromwell, and was a member (May 14, 1659) and president (Aug. 1659) of the council of State. On the expulsion of the Long Parliament, in which he had a seat, he was included in the committee of safety which superseded the council. He again received the Great Seal on Nov. 1.

On the failure of his plan to persuade Fleetwood to forestall Monk by making terms with Charles, he retired to the country. He lived at Chilton, in Wiltshire, dying on July 28, 1675.

He was the author of *Memorials of the English Affairs from the beginning of the reign of Charles I.* . . . published 1682 and reprinted, largely a compilation from various sources, composed after the events and abounding in errors. His work of greatest value, his *Annals*, still remains in ms. in Lord Bute's and Lord de la Warr's collections (*Hist. Brit. Comm. III. Rep.*, pp. 202, 217; also Egerton mss. Brit. Mus. 997, add. mss. 4,992, 4,994); his *Journal of the Swedish Embassy* . . . was published 1772 and re-edited by Henry Reeve in 1885 (add. mss. 4,902, 4,991 and 4,995 and *Hist. MSS. Comm. III. Rep.*, 190, 217); *Notes on the King's Writ for Choosing Members of Parliament* . . . were published 1766 (*see* also add. mss. 4,993); *Memorials of English Affairs from the supposed expedition of Bruce to this Island to the end of the Reign of James I.*, were published 1709; *Essays Ecclesiastical and Civil* (1706); *Quench not the Spirit* . . . (1711); some theological treatises remain in ms., and several others are attributed to him.

See the article by C. H. Firth in the *Dict. Nat. Biog.*, with authorities there quoted; R. H. Whitelocke, *Memoirs of B. Whitelocke* (1860); H. Reeve's edition of the *Swedish Embassy;* Foss's *Judges of England; Eng. Hist. Rev.*, xvi. 737; Wood's *Ath. Oxon.*, iii. 1,042.

WHITE MOUNTAINS, the portion of the Appalachian mountain system which traverses New Hampshire (U.S.A.), between the Androscoggin and Upper Ammonoosuc rivers on the north and the lake country on the south. They cover an area of about 1,300m., are composed of somewhat homogeneous granite rocks, and represent the remnants after long-continued erosion of a region formerly greatly elevated. The geological formation is an igneous ejection of granite, burst through horizontal strata. The foundation seems to have lifted from the depths and bears upon its shoulders a huge covering of mica slate that often extends a quarter of a mile below the summit. The group is divided into two main portions by Crawford Notch, the valley of the Saco river. To the west of the notch are the Franconia mountains where Mt. Lafayette, the highest peak, stands 5,269 ft. above sea-level. To the east lies the Presidential range, so called because the chief summits are named after the U.S. Presidents. Of this group Mt. Washington is the highest peak, rising 6,293 ft. above the sea. Thirteen other summits have an elevation exceeding 5,000 feet. Some of the best known are Mt. Adams, 5,805 ft.; Mt. Jefferson, 5,725 ft.; Mt. Clay, 5,554 ft.; Mt. Monroe, 5,390 ft.; and Mt. Madison, 5,380 feet.

See the article NEW HAMPSHIRE; the *Guidebook*, part i. (Boston, 1907), published by the Appalachian Mountain Club; and *Appalachia*, (1876 *seq.*), a periodical published by the same club.

WHITE PLAINS, a city of New York, U.S.A., the county seat of Westchester county; 24 m. N.N.E. of the Grand Central station in New York city, on the Bronx river, midway between the Hudson and Long Island sound. It is served by the New York Central and electric railways and motor-bus lines. Pop. (1920) 21,031 (20% foreign-born white and 5% negroes); 1928 local estimate over 29,000. White Plains is a beautiful residential suburb, spreading over 10 sq.m. of rolling tree-clad hills and meadowlands, with the Bronx River parkway running through it and three lakes (Silver, Kensico and Rye) in the vicinity. The city's assessed valuation for 1929 was $138,634,673.

The early traders called this region "the white plains" from the groves of white balsam which covered it. In Nov. 1683, a party of Connecticut Puritans came from Rye (in the territory then in dispute between New York and Connecticut), bought land from the Indians and established a settlement. Their title was contested by the heirs of John Richbell, and the controversy was not settled until 1722. In 1759 White Plains succeeded Westchester as the county seat. In the early summer of 1776 the Third Provincial Congress of New York met here, in the old court house on South Broadway (where an armory now stands). From the steps of this building the Declaration of Independence was officially read for the first time in New York on July 11, 1776, and here New York was first declared a State and the work of drafting its first Constitution was begun. In Oct. 1776, Washington withdrew his forces from the north end of Manhattan and concentrated them near White Plains. On Oct. 28 the Americans (about 1,600) defending rude earthworks on Chatterton's hill (on the west bank of the Bronx river) were attacked by 4,000 British and Hessians, and after making a stubborn resistance retreated in good order across the river. The American loss was about 125; the British, 250. The old Miller house, in North White Plains, was occupied at intervals by Washington as his headquarters before the battle and again in the summer of 1778. In 1779 a Continental force under Aaron Burr was stationed here for some months, and in July 1781, the Heights of Greenburgh, west and south-west of the city, were occupied by parts of Lauzun's and Rochambeau's French army. White Plains was incorporated as a village in 1866 and as a city in 1916.

WHITE RUSSIA, a republic of the Russian U.S.S.R. Area 125,703 sq.km. Pop. (1926) 4,979,712. Poland lies to the west, the Ukrainian S.S.R. to the south, the provinces of Bryansk and Smolensk to the east and the Pskov district of the Leningrad Area to the north. In the north and west there are hills, the Lysaya Hills north of Minsk being the highest (over 1,000 ft.), but the south-east is a low and marshy plain sloping to the Pripet river, and the swamps and marshes lying south of it, and forming part of a great lacustrine depression. The Western Dvina flows through a morainic region and its bed is interrupted by waterfalls due to boulders and outcrops of harder rocks, as is that of the Dnieper. The Berezina canal links these two rivers and thus avoids some of these difficulties. Among the numerous streams of the Republic are the Drut, Berezina, Pripet and Sozh, tributaries of the Dnieper, and various streams flowing into the Niemen and the Western Dvina. Fishing in these streams and the numerous lakes is productive, and about 200 artificial breeding ponds exist. The chief kinds of fish are pike, bream, sandre, perch, dace, tench, crucian-carp, silurus and ling. Fishing for export ceased

during the recent wars and did not begin again until 1923. In 1924–5 the catch was about 800 tons as against a normal yield of 9,500 tons. Steam navigation was also greatly lessened by the destruction of the war years and is still far below pre-war level; the severance of the former opening to the Baltic via the Western Dvina is another factor in the diminished freightage.

The forest wealth of the region has been markedly diminished by destructive exploitation before the World War and by the ruthless cutting of forest during 1914–21 for the conflicting armies. At present about 25% of the region is under forest, oak in the south and pine and fir in the north. Much timber is exported through Latvia for foreign markets, the rest going to the Ukraine, the Crimea and the Moscow region. In dependence on the forest there are saw-milling, wood-working, match and paper factories, but many were razed to the ground during the war period and production is much diminished. A tenth of the surface is covered with bog, and peat working is increasing. This peat and the numerous waterfalls are potential sources of electrical energy, little developed as yet in the republic; a station at Osinovich is under construction (1928). The soils in the republic are not very favourable to agriculture, being mainly of the ash-coloured forest type, with some clays and sands. The climate is less continental than that of the rest of Russia and is under the influence of the Baltic and Atlantic; the rainfall averages about 30 inches per annum. Frost lasts for 130 to 140 days, while the summer temperature averages 18·5° C.

Agriculture.—These climatic and soil conditions are favourable to stock-raising, which is carried on successfully, pig-breeding having developed lately. There is not much dairying except near the towns for local supply. Cattle diminished markedly in the war years, and their progress towards more normal numbers was sharply set back by the slaughter of 1926–7 consequent on the bad harvest. In 1924–5 manuring for meadows was introduced in some places, with great benefit to the hay crop. Agriculture is still pre-eminently of a grain character, though potato and flax cultivation began to increase in 1924. The chief crops are rye and oats. The region is, however, comparatively densely peopled and the local grain supply is altogether insufficient, 267,000 tons of imported grain being used in 1926–7. The strip system prevails, though in some places individual farms have replaced it. In spite of the devastation of the area, restoration of sowing has been more rapid here than elsewhere in Russia.

The cutting off of the western regions from Russia has altered the balance and direction of trade. In accordance with the long and tragic history of this region of struggle with difficult natural conditions and with perpetual invasions the standard of life is low and illiteracy is common. Here, as in most other places in Russia, there is insufficient accommodation in school for children and at least 40% of the present generation are receiving no education. Since 1921 a Communist University and an Institute of White Russian Culture, with a Polish and a Jewish section have been established in Minsk. The population consists of White Russians 80%, Jews 8%, Great Russians 7%, Poles 2% with some Lithuanians, Ukrainians, Letts, etc. The administrative centre is Minsk (*q.v.*). Other towns (*q.v.*) are Vitebsk, Gomel, Mogilev, Bobruisk, Borisov, Orsha and Polotsk.

The White Russians are by Leroy Beaulieu considered to be the purest of the three great Slav divisions, Great Russians, Little Russians (Ukrainians) and White Russians. They took refuge from Tatar raids in the swamps and marshes. Their dialect is akin to Great Russian, but political causes separated the two races, and the White Russians, like the Ukrainians, were for some time under non-Russian rule. In physical type they are brachycephalic, average cephalic index 85, greater than that of the Great Russians, possibly because of intermixture with the Poles. Their hair is light brown or brown, with a decided reddish tinge and their eyes light brown. Apparently they received the name "White" Russians because of their costume, white smock, bast shoes with white leggings, and a white homespun coat.

History.—After the rise of Lithuania, the region became subject to the princes of that country and when the Litva prince became king of Poland, the White Russian territory fell under Polish rule. The official documents of the Litva dukes, however, continued to be written in White Russian for some time after this. Under Ivan the Great (1462–1505), part of the White Russian territory was wrested from Poland. Under Basil III. (1505–1533), the power of Moscow extended to the Dnieper river, but during the "Time of Troubles" the territory was regained by Poland, and by the truce of Deulino, Poland retained Smolensk and all the territory west of it. The struggle between Russia and Poland continued at intervals, but White Russia remained in Polish hands until the Treaty of Vilna 1656, when Poland ceded White Russia and the Ukraine to Russia. But war broke out again between the two countries and ended disastrously for Russia, though she retained the district of Smolensk, and the Ukraine east of the Dnieper. The deep division between the Poles and the Russians on the question of religion ultimately led to further troubles, and when in 1766 the Polish diet refused to grant equal rights and full liberty of conscience to non-Roman Catholic subjects, the flame of rebellion broke out at Slutsk in White Russia.

In 1772 the first partition of Poland between Russia, Prussia and Austria made the Western Dvina and the Drut the Russian frontier, so that a portion of White Russia with 1,600,000 inhabitants came under Russian rule. By the second partition of Poland in 1793, Russia acquired all the rest of White Russia, a large part of Black Russia (the territory between the Pripet and the Niemen, west of the Berezina), and the Ukraine west of the Dnieper, and in 1795, by the third partition extended her territories to include Courland and all the rest of Lithuania and Black Russia. During this long struggle between Poland and Russia, the territory of the White Russians was repeatedly fought over and devastated, and a general low level of cultural and economic conditions in the region ensued and is still evident to-day. In 1812 the unfortunate country was crossed by Napoleon's army on its march to and from Moscow *via* Smolensk, and suffered further devastation, from which it had not recovered when war broke out in 1914. It then lay close to the war zone and shared in the disorder and disasters of the Russian retreat in 1916.

After the 1917 revolution a Committee of Workers, Soldiers and Peasants of the Western Front was formed and an attempt to establish a soviet system was thus made. But in February, 1918 Minsk and the whole region as far as the Dnieper was occupied by German troops, withdrawn in November 1918, after the revolution in Germany. The Soviet of Workers and Peasants then declared an independent White Russian Republic and efforts were made to form a joint Lithuanian and White Russian Republic. But early in 1919 war again broke out with Poland and Polish troops occupied the district. Finally, by the treaty of Riga, 1921, peace was declared between Poland, Russia and the Ukraine, the western part of White Russia passing under Polish rule. For exact details of the new boundary, see *British and Foreign State Papers, 1921,* vol. cxiv., published in 1924. The Soviet government in 1924 and 1926 extended the boundary of White Russia eastwards, and the towns of Vitebsk and Gomel, with a strip of territory on the east bank of the Sozh, are now included in it.

WHITE SLAVE TRAFFIC. The movement for the suppression of the international traffic in women and children for immoral purposes may be said to some extent to date from the attempt, in the middle of the 19th century, to introduce what may be described as a system of State regulation of vice into England. This system owed its introduction to the remarkably high incidence of venereal disease at that period among soldiers and sailors, and as a result, in 1864, the first of the Contagious Diseases Acts was passed. There were then, and still are, two bodies of opinion; in some cases the State recognized prostitution as a necessity which could not be overlooked, but which called for control by registration and sanitary supervision; in other countries a strong body of opinion favoured no such recognition. In 1875 a meeting was called by Josephine Butler in Geneva to consider white slave traffic from its international aspect and in its relation to state regulation, and as a result the International Federation for the Abolition of State Regulation of Vice was formed. In 1898 and 1899 William Alexander Coote, the secretary of the National Vig-

ilance Association of Great Britain, visited Germany, Holland, Belgium, France, Russia, Switzerland, Spain, Austria and the Scandinavian countries, and in the capital of each organized a national committee for the suppression of white slave traffic. An international congress was therefore held in London in June 1913, and at that congress the International Bureau for the Suppression of White Slave Traffic was constituted to co-ordinate the work of the national committees. The French Government had called an official conference in Paris in 1904, and an international agreement was drafted, under which the signatory powers undertook to appoint a central authority in each country charged with the co-ordination of all information relative to the traffic. The signatories undertook to ensure vigilance at ports and railway stations, to notify the arrival in each country of suspected persons, to take declarations from alien prostitutes, to protect and maintain the victims of the traffic pending repatriation (for which they also took the responsibility) and to supervise registry offices or agencies engaged in finding employment for women and girls abroad.

In 1910 a second governmental conference was called in Paris. A convention drawn up after this conference provided for the punishment of procurers for immoral purposes of girls and women, either minors or of full age, in whatever country the various acts constituting the offence might be committed. It provided also for the enactment, in those countries where needed, of the necessary legislation. In addition to the official conferences mentioned, the International Bureau was instrumental in calling together conferences and congresses in various parts of Europe.

The names of four persons will always be remembered for their active association with the early movement for abolition of the traffic in women and children: Josephine Butler and W. A. Coote (England), Senateur Beranger (France), and Alfred de Meuron (Switzerland).

Work of the League of Nations.—Such was the preliminary work done before the League of Nations came into existence on Jan. 10, 1920. Article 23 (c) of the Covenant states that members "will entrust the League with the general supervision over the execution of agreements with regard to the traffic in women and children." On the decision of the first assembly of the League, a questionnaire was sent to all Governments to ascertain the measures taken or proposed in the various countries to put an end to the traffic. The Council of the League was also invited to convene an international conference. Thirty-four States were represented at this conference, which was held in Geneva from June 30 to July 5, 1921. To it were invited, not only States parties to the previous international engagements, but all States willing to take part, and the meetings were open to the public. The conference examined the replies to the questionnaire, and a Final Act was adopted containing a number of recommendations requiring action by Governments. This Final Act was approved by the Council and, in Sept. 1921, the Assembly invited all Governments to authorize their delegates to sign forthwith a convention submitted by the British Government in which many provisions of the Final Act were given conventional form. This convention was open for signature on Sept. 30, 1921; it has been signed by 34 States, 28 of which (including the British Empire, the Dominions of Australia, Canada, New Zealand and South Africa and India) have ratified the convention. Twenty-seven British colonies and dependencies and the territory of 'Iraq (British mandated territory) have adhered.

The new convention was not intended to replace the earlier instruments, but to supplement them, and it is for that reason that the first article prescribes that the high contracting parties, if not already parties to the agreement of 1904 and the convention of 1910, shall ratify or adhere to them without delay. Other new provisions in the convention are that the punishments prescribed under the convention of 1910 for those who traffic in women and girls are made applicable to those who engage in the traffic of children of either sex. The punishment is required not only of those guilty of offences committed, but of attempts to commit the offence and, within legal limits, of acts preparatory to the committing of such offence. The minimum age under which it is an offence to procure a woman for immoral purposes, even with her consent, previously fixed at 20, is raised to 21. In addition, the provisions of the convention of 1921 relating to extradition go further than those of the convention of 1910, the parties agreeing that in cases where no extradition convention exists between two countries, they will take all measures in their power to extradite or provide for the extradition of persons accused or convicted of certain offences specified under the convention of 1910. They also undertake to prescribe such regulations as are required for the protection of women and children seeking employment in another country, if they have not already done so.

The Advisory Committee.—Another outcome of the conference of 1921 was the setting up of an advisory committee to the Council on all matters relating to the traffic in women and children. This committee sat for the first time in June 1922. It was composed of delegates of Governments, and of assessors appointed by international voluntary organizations. During its six meetings it had under special consideration the questions of employment of women abroad by theatrical, variety, concert and cinema agents, the moral welfare of women and children on emigrant ships; the consideration of the system of licensed houses; the employment of women police, and the consideration of the laws and regulations in force in various countries for suppressing the traffic.

Of these questions, one which has been given much importance is that of the system of the licensed house. Though it may be maintained that the regulation of vice in any country is purely an internal and national question, it was the opinion of a large number of members on the advisory committee that the licensed-house stimulates immorality and encourages an international trade to supply a certain market. The committee gave special attention to the subject, and as a result of its investigations, the Council "recognizing the connection which may exist between a system of licensed houses and the traffic in women and children," invited States which had abandoned the system to explain the motives of their decision in abandoning it, in so far as they concern the traffic; and States which still maintain the system to indicate whether their experience leads them to believe that the system encourages the international traffic or otherwise.

The majority of answers received appear to indicate a strong movement for the abolition of the licensed house system, which some of the new States created by the Treaty of Versailles adopted and subsequently abandoned. The reasons given by these States and others for this abolition are various. It is said, for example, by some that the system has not justified expectation, and has tended to disseminate rather than diminish venereal disease. It is the opinion given by more than one State that the licensed brothel has proved itself to be a permanent factor in the traffic in women and children, in fact that the traffic owes its very life to the existence of the licensed brothel. The Dutch Government, in giving the reasons for the abolition of the system of regulation in that country, state that experience has shown that the traffic depends on the existence of the licensed brothel and that its abolition has almost killed the traffic. On the other hand certain countries, in replying, say that they maintain the system in the interests of public health. This is sometimes qualified by the statement that there is an obvious contradiction existing between the system of tolerance and the higher end of the State, or that the State has decided to give the matter serious attention in view of the growing public opinion in favour of abolition, and in other reports it is said that although the system is maintained, a scheme is in course of preparation for its suppression.

The Expert Investigation, 1924–1926.—To ascertain the extent of the world's traffic, the routes which it follows and the individuals or organizations connected with it, a small body of experts was nominated to make a world investigation on the spot with the consent of and in conjunction with the Governments concerned. This investigation was financed by the American Bureau of Social Hygiene.

The experts were chosen on the ground of special knowledge and qualifications, irrespective of nationality, the Social Section of the League of Nations supplying the secretarial assistance.

The principles laid down in conducting the enquiry were as follows:

(a) The enquiries must be carried on only by trained and experienced persons;
(b) Each enquiry should relate to a limited area;
(c) Each enquiry should be detailed and thorough;
(d) The enquiries should be begun, as far as possible, in cities and countries to which women are alleged to have been sent for purposes of prostitution.

The investigators visited some of the chief cities in 28 countries, including countries in Europe, countries in northern Africa bordering on the Mediterranean, countries in North America, Central America and countries on the Atlantic coast of South America.

In March 1927, the committee of experts presented the report of their investigations into the extent of the traffic in women and children to the Council. This report shows that a traffic in women and children exists beyond a doubt. They name those countries which appear to them to be the chief countries of demand or supply. The report lays special stress on the necessity for closer international co-operation and a more widespread knowledge of the position with the idea of creating a sound and vigilant public opinion. It recommends that increased penalties should be enforced for the person making a profit out of the moral degradation of another and it closes with a statement to the effect that "the difficulty of eliminating the third party element becomes greater in countries where the keeping of brothels is legal, where licensed houses exist and where the system of registering prostitutes is maintained." "The existence of licensed houses," say the experts, "is undoubtedly an incentive to traffic, both national and international." "It behooves all governments," the report goes on to say, "which place reliance on the older system of preventing the spread of venereal diseases to examine the question thoroughly in the light of the latest medical knowledge and practice and to consider the possibility of abandoning a system which is fraught with such dangers from the point of view of international traffic." (*See* PROSTITUTION.)

WHITE STAR LINE, the name by which the world knows the ships of the Oceanic Steam Navigation Company (the shares of which are owned by the White Star Line, Limited), founded by T. H. Ismay in 1869. Ismay's first steamer, the "Oceanic," sailed from the Mersey for New York in March, 1871. In 1874–75 the "Britannic" and "Germanic," each of 5,000 gross tons, were built.

In 1874 the company had extended its operations, by agreement with the Occidental and Oriental Steamship Company of San Francisco. Ten years later the joint service of the White Star Line and Shaw Savill and Albion Company to New Zealand was begun.

The last of the company's single-screw steamers were built in 1888 for the live-stock trade. These were followed by the twin-screw passenger liners "Teutonic" and "Majestic." In 1899 the "Medic" inaugurated a service of twin-screw passenger and cargo steamers between Liverpool, South Africa and Australia, in which she was associated with the "Afric," "Persic," "Runic," and "Suevic," all of about 12,000 tons, and accommodating one class only of passengers.

A new "Oceanic" of 17,274 tons was placed in the New York service in 1899. She was lost in Government service during the World War. The "Celtic" and "Cedric," each over 21,000 tons, were produced, soon after the "Oceanic," and in turn were followed by the "Baltic," of 24,000 tons, and the "Adriatic," of 25,000 tons.

The company became a part of the International Mercantile Marine Company in 1902, but this in no way affected its policy. In 1907 the White Star Line transferred its New York mail service, previously operated from Liverpool, to Southampton. In 1911 the "Olympic," a triple-screw steamer of over 46,000 tons, entered the service. The "Britannic," a ship of nearly 50,000 tons built for this service, was sunk in the World War.

In 1909 the White Star Line combined with the Dominion Line in forming a joint service from Liverpool to Canada, the first steamers of this White Star Dominion Line being the "Laurentic" (triple-screw), 14,892 tons, and "Megantic" (twin-screw), 14,878 tons. During 1926 the name of the service was changed to the White Star Line Canadian Services, and in the spring of 1928 it added the "Albertic," 19,000 tons, and "Calgaric," 16,000 tons. The new "Laurentic," 18,700 tons, entered the trade early in 1928.

In 1921 the White Star Line acquired the "Majestic," 56,551 tons, and "Homeric," 34,356 tons, the former being one of the two largest vessels in the world, for its mail and passenger service from Southampton and Cherbourg to New York. The "Adriatic," "Baltic," "Cedric" and "Celtic"—the big four—operate in the Liverpool-Queenstown-New York trade.

In 1926 the shares of the Oceanic Steam Navigation Company, Limited, were purchased from the International Mercantile Marine Company, by the White Star Line, Limited, formed for the purpose, the line thus becoming once more a British concern.

The aggregate tonnage owned by the company (1928) is 546,000 and 69,000 tons are under construction, including the new "Britannic," a motor vessel for the Liverpool-New York service, 27,000 tons. The capital of the White Star Line, Limited, stood in 1928 at £9,000,000. (L. C. M.)

WHITETHROAT, a name given to two little birds belonging to the *Sylviidae* or warblers (*q.v.*). The common whitethroat or nettlecreeper, *Sylvia cinerea,* is widely spread over Great Britain, in some places common. It is a restless bird, and in spring the male often gives his song on the wing. The lesser whitethroat, *Sylvia curruca,* is less often seen. The plumage is smoky-grey above and white below. Its song is unusual, consisting of a series of repeated notes, the usual "warble" being reduced to a short preface inaudible at a little distance. The nests of each of these species are built of bents or other plant-stalks, and usually lined with horsehair; the eggs are spotted with olive-brown.

WHITGIFT, JOHN (1530?–1604), English archbishop, was the eldest son of Henry Whitgift, merchant of Great Grimsby, Lincolnshire, where he was born. He was educated by his uncle, Robert Whitgift, abbot of the neighbouring monastery of Wellow, then at St. Anthony's school, London, and finally at Cambridge, where he became a fellow of Peterhouse in 1555. Having taken orders in 1560, he became chaplain to the bishop of Ely, who collated him to the rectory of Teversham, Cambridgeshire. In 1563 he was appointed Lady Margaret professor of divinity at Cambridge, and in 1564 regius professor of divinity. He became master first of Pembroke Hall and then of Trinity. He had a principal share in compiling the statutes (1570) of the university, and in November of the same year was chosen vice-chancellor. Macaulay's description of Whitgift as "a narrow, mean, tyrannical priest, who gained power by servility and adulation," is unjust, but he was intolerant and arbitrary. Whitgift, with other heads of the university, deprived Thomas Cartwright in 1570 of his professorship, and in Sept. 1571, as master of Trinity, deprived him of his fellowship. In June of the same year Whitgift was nominated dean of Lincoln. In the following year he published *An Answere to a Certain Libel intituled an Admonition to the Parliament,* which led to further controversy with Cartwright. On March 24, 1577, Whitgift was appointed bishop of Worcester, and during the absence of Sir Henry Sidney in Ireland (1577) he acted as vice-president of Wales. In August 1583 he was appointed archbishop of Canterbury. Although he wrote a letter to Queen Elizabeth remonstrating against the alienation of church property, Whitgift always retained her special confidence. In his policy against the Puritans, and in his vigorous enforcement of the subscription test, he thoroughly carried out the queen's policy of religious uniformity. He drew up articles aimed at nonconforming ministers, and obtained increased powers for the Court of High Commission. In 1586 he became a privy councillor. His action gave rise to the Marprelate tracts, in which the bishops and clergy were bitterly attacked. Through Whitgift's vigilance the printers of the tracts were discovered and punished; and in order more effectually to check the publication of such opinions he got a law passed in 1593 making Puritanism an offence against the statute law. In the

controversy between Walter Travers and Richard Hooker he interposed by prohibiting the preaching of the former and he moreover presented Hooker with the rectory of Boscombe, Wilts., in order to afford him more leisure to complete his *Ecclesiastical Polity*, a work which, however, cannot be said to represent either Whitgift's theological or his ecclesiastical standpoint. In 1595 he, in conjunction with the bishop of London and other prelates, drew up the Calvinistic instrument known as the Lambeth Articles, which were not accepted by the church. Whitgift attended Elizabeth on her deathbed, and crowned James I. He was present at the Hampton Court Conference in Jan. 1604, and died at Lambeth on Feb. 29 of that year. He was buried in the church of Croydon. Whitgift was noted for his hospitality, and was ostentatious in his habits, sometimes visiting Canterbury and other towns attended by a retinue of 800 horsemen. His name is commemorated in the hospital for poor persons and the schools founded by him at Croydon in 1595.

Whitgift left several unpublished works which are included among the mss. *Angliae*. Many of his letters, articles, injunctions, etc., are calendared in the published volumes of the "State Paper" series of the reign of Elizabeth. His *Collected Works*, ed. for the Parker Society by John Ayre (3 vols., Cambridge, 1851–53), include, besides the controversial tracts already alluded to, two sermons published during his lifetime, a selection from his letters to Cecil and others, and some portions of his unpublished mss.

A *Life* of Whitgift by Sir G. Paule (1612, 2nd ed. 1649) was embodied by John Strype in his *Life and Acts of Whitgift* (1718). There is also a life in C. Wordsworth's *Ecclesiastical Biography* (1810), W. F. Hook's *Archbishops of Canterbury* (1875), and vol. i. of Whitgift's *Collected Works*. *See* also H. J. Clayton, *Whitgift and his Times* (1911).

WHITHORN, royal burgh and parish of Wigtownshire, Scotland, 12¼ m. S. of Wigtown by rail. Pop. (1921) 1,033. St. Ninian or Ringan, the first Christian missionary to Scotland, landed at the Isle of Whithorn, where he built (397) a stone church, which, out of contrast with the dark mud and wattle huts of the natives, was called Candida Casa, the White House. Ninian was buried in the church. A hundred years later the Magnum Monasterium, or monastery of Rosnat, was founded and in the 8th century became the seat of the bishopric of Galloway. It was succeeded in the 12th century by St. Ninian's Priory, built for Premonstratensian monks by Fergus "King" of Galloway, of which only the chancel (used as the parish church till 1822) and other fragments remain. In Roman times Whithorn belonged to the Novantae, and William Camden, the antiquary, identified it with the Leukopibia of Ptolemy.

WHITING, a city of Lake county, Indiana, U.S.A., on Lake Michigan and the Illinois State line, 17 m. S.E. of the Chicago "Loop." It is on Federal highways 20 and 41, and is served chiefly by the Baltimore and Ohio, the New York Central, the Pennsylvania and the Pere Marquette railways, and lake steamers. Pop. 10,145 in 1920; estimated locally at 12,500 in 1928. Whiting is the centre of the industrial region known as the Calumet District, and its boundaries touch those of Hammond and East Chicago. Its principal industry is the refinery of the Standard Oil Company of Indiana. The city's assessed valuation for 1927 was $27,013,080. Whiting was founded in 1881, incorporated as a town in 1895, and chartered as a city in 1903.

WHITING (*Gadus merlangus*), a silvery fish that ranges from Norway to the Mediterranean, and differs from the cod in having no barbel. It is valued as a food fish, and reaches a weight of about three pounds.

WHITLEY, JOHN HENRY (1866–), Speaker of the British House of Commons, was born at Halifax on Feb. 8, 1866, and educated at Clifton college and London university. He was elected Liberal M.P. for Halifax in 1900, and represented his native city for 28 years. From 1907 to 1910 he was junior lord of the treasury, and in 1910 became deputy chairman of ways and means. From 1911 to 1921 he was chairman of ways and means and deputy speaker. In 1916 he acted as chairman of the Reconstruction Committee on Relations between Employers and Employed, and his name has become associated with the joint industrial councils established for many industries as a result of the reports of that committee. Whitley was appointed Speaker in 1921, retiring in 1928 and declining the usual peerage. He was awarded the Order of Merit. He had an urbane manner in dealing with delinquents which was notably effective.

WHITLEY COUNCIL: *see* INDUSTRIAL RELATIONS.

WHITLOCK, BRAND (1869–), American diplomat and writer, was born at Urbana (O.), March 4, 1869. As a political reporter on the Chicago *Herald* and as assistant in the office of the Illinois secretary of state, Mr. Whitlock came in contact with John P. Altgeld, governor of Illinois who, like "Golden-Rule" Jones, mayor of Toledo, did much to develop his political idealism. He was admitted to the Illinois bar in 1894, and to the bar of Ohio in 1897. From that year until 1905 he practised law in Toledo and then as an Independent became mayor for four terms, in 1911 refusing nomination a fifth time. The record of his labours for the "Free City" of which he dreamed is told in his autobiography *Forty Years of It* (1914, new edition 1925).

In 1913 he was appointed U.S. minister (later ambassador) to Belgium. Before he had been in Belgium a year the World War broke out and the German invasion took place. Although the other diplomatic bodies followed the Belgian Court to Havre, Whitlock insisted on remaining in Brussels. It was largely due to his urgent advice that Brussels did not resist, and thus escaped devastation. In the early days of the war he gave protection to many German residents who had been unable to leave the country. By his firm attitude toward the German military officials he saved many innocent Belgians from death; but his activities on behalf of Edith Cavell were unavailing as he was misled at the last moment through false promises by the Germans. After the formation of the Commission for Relief in Belgium, its operations were placed wholly under his direction. His ceaseless work on their behalf won the gratitude of all Belgians and was rewarded by many honours. Mr. Whitlock resigned Feb. 1, 1922. An account of his experiences is given in *Belgium, a Personal Narrative* (1919).

Whitlock himself spoke of vacillating "between an interest in letters and an interest in politics," and there is no doubt that his early literary work, at least, reflected this duality of tastes. *The 13th District* (1902) revealed the insidiously corrupting influence of certain phases of politics; and *The Turn of the Balance* (1907), a poignant exposure of social injustices, was written "out of the contemplation of the misery, the pathos, the hopelessness of the condition" of the victims during his police court experiences. A fruit of his administrative work is the little monograph *On the Enforcement of Law in Cities* (1913). His later novels, such as *J. Hardin and Son* (1923) and *Uprooted* (1926), are less concerned with ethical problems. His technique at all times, however, has revealed his admiration for the ideals and methods of that gentle advocate of Tolstoism and realism, William Dean Howells.

WHITMAN, WALT (1819–1892), American poet, was born near Huntington, Long Island, on May 31, 1819. His father, of 17th century English freeholding stock long settled in Huntington township, was a farmer and later a house-builder, democratic in politics and inclined toward Quaker liberalism in religion. Of robust Dutch and Welsh farming and seafaring descent was his "perfect mother," who, though possessing as little education as her husband, deeply impressed her son through her sanity, practicality, encompassing affection and intuitive spiritual nature. The family moved to the village of Brooklyn about 1824, where Walt attended the public schools until he was twelve. His real education, however, was acquired through wide and thoughtful reading of a great mass of current, romantic, classical and oriental literature; through intimate contacts with nature and the metropolis across the East river, where he had opportunities for constant attendance at lectures, exhibitions, theatres, concerts, operas and political gatherings and for associating with "powerful uneducated persons" like boatmen and omnibus drivers, as well as politicians, literary and artistic Bohemians, and more prominent persons; through several years of country school teaching on Long Island, "boarding round" among the honest, independent bourgeoisie; through travel, especially in the West and the South, which developed in him an enduring sympathy for all sections; and finally through long association with magazines and newspapers, as journeyman compositor, contributor of conventional prose and verse

or editor, an association which awakened in him literary ambitions and encouraged a national point of view.

An earnest of his future authorship was given as early as 1846–48, when, editing the democratic *Brooklyn Daily Eagle*, Whitman expressed the religio-patriotic enthusiasm he had inherited from revolutionary ancestors. He championed the sentimental and idealistic reforms popular in the "transcendental" period of American thought and voiced the adolescent spirit of nationalism in his demand for native manners, drama, opera and literature. In politics, temperament and philosophy always a staunch individualist, he opposed the extension of slavery into the new States of the Union so uncompromisingly as to lose his editorial position on the conservative *Eagle*, though for that same opposition he was shortly afterward put in charge of the *Brooklyn Daily Freeman*.

In 1855 Whitman published *Leaves of Grass*. This was a large, thin volume as odd in format and style as it was original in mood and thought, yet in it Emerson, himself a strong influence in its creation, perceived great promise as being "the most extraordinary piece of wit and wisdom America has yet contributed." Having absorbed his country until he thought himself fundamentally typical of it, Whitman here began a lifelong attempt not only to record himself, body and soul, in poetic autobiography, but also to create a character-epic of America. "Most of the great poets are impersonal," he said, "I am personal. . . . In my poems, all revolves round, concentrates in, radiates from myself. I have but one central figure, the general human personality typified in myself. But my book compels, absolutely necessitates, every reader to transpose himself or herself into the central position, and become the living fountain, actor, experiencer himself or herself, of every page, every aspiration, every line." Such a purpose naturally led him to discard conventional poetic methods, of form, atmosphere and allusion, and to rely upon the direct address of rhythmical declamation.

The book met a varied reception. At first there were few to rate it except according to the current standards from which Whitman appealed, though Thoreau, who visited him in Brooklyn, considered him "probably the greatest democrat that ever lived." Despite general neglect and frequent abuse, Whitman continued through life to complete the record of his inner growth and changes, often publishing poems or groups of poems separately, but finally incorporating them all in the parent volume, *Leaves of Grass*. Following the insistent, arrogant, if frequently sublime, egotism of the editions of 1855, 1856 and 1860 came a treatment of democracy *en masse*, a socializing result due to Whitman's personal contact with the armies in the national capital.

For ten years, 1863–73, Whitman lived in Washington acting as war correspondent and government clerk, but spending much of his time, means and strength during war years in daily ministrations to the wounded Northern and Southern soldiers in the hospitals. His reactions to, and interpretations of, the great struggle which was testing democracy, always to him more a religion than a political creed, are to be found in *The Wound-Dresser*, a volume of war-time letters to his mother, in *Drum-Taps*, a little volume of virile yet compassionate war poems, including the universally admired *When Lilacs Last in the Door-yard Bloom'd* on the death of Lincoln, and in parts of *Specimen Days*, picturesque descriptions of his activities and observations. Not only did the Civil War discipline his poetic art, making it objective as well as subjective, teaching him to sing of the nation as a nation, in terms of mature idealism, no longer as a mere land of opportunity affording "open roads" to individual self-realization; but it also laid the foundation for his influence as an international force by making him the prophet of a world at last united in peace. Whitman's most important essay, *Democratic Vistas*, if one except the famous preface of 1855 and *A Backward Glance O'er Travell'd Roads*, was likewise a result of the war.

Stricken with paralysis in 1873, partly as a result of hospital labours and exposure, Whitman went to spend his last 19 years of invalidism in Camden, N.J. His creative work was thus ended before his plan was complete, the sweet reasonableness of his maturity being less fully represented than the hopeful self-reliance, the exuberant spirit of his youth; nearly all the poems after 1873 betray a flagging imagination and a lowered vitality, though losing none of his cheerfulness or faith.

Gradually, at home and abroad, defenders of the poet took up his cause as something more than a literary fad: John Burroughs, his first biographer; William Douglas O'Connor, whose *Good Gray Poet*, castigating Secretary Harlan for dismissing Whitman from a Department of the Interior clerkship because of his authorship of *Leaves of Grass*, gave the gray-haired, gray-garbed poet his popular sobriquet; Dr. Richard Maurice Bucke, who cared for him as a patient, wrote the first considerable biography to present Whitman as a mystical superman, and edited several volumes of Whitman letters and notes; Horace Traubel, who in the poet's last years and later played the devoted but by no means sycophantic Boswell to him; William Michael Rossetti, whose volume of selections from Whitman's poems early (1867) and tactfully introduced him to the general English public; John Addington Symonds, who, like Stevenson, was stimulated and refreshed by the healthy spirit and universal sympathies of Whitman, declaring that the American bard had influenced his life more than any book save the Bible, and shortly after Whitman's death wrote an acute and sympathetic study of his work; and others in Germany, Denmark and France who translated Whitman and interpreted him to the Old World.

He had been long in overcoming the prejudice aroused by his conception of art, his "heroic nudity" in the treatment of nature in the human body, and what was taken to be his "egotism"; but when he died in his humble home in Mickle street, now a museum, it had already become a shrine where actors, artists and lovers of free letters were frequent pilgrims, and he, the cheerfulest poet of immortality, passed away content to believe that his vision of a larger life for man had been caught by others.

The Man.—Whitman and his works were as paradoxical as the age and land they sought to express. A large, healthy, hirsute body fond of nature and of sense enjoyments was no more characteristic of him than his womanly sensitiveness and quiet sympathy; his courageous imagination which might either express itself in terms of adolescent egotism or in haunting songs of those "eidolons" which ever lure on the race of hardy spiritual pioneers was no more fundamental than his engaging mystical naïveté which so strongly affected those who came into personal relations with him and made him the "caresser of life wherever flowing"; and his quest of ideal beauty always followed, even while decrying art for art's sake, was not pursued by turning his back on the realities of commonplace life or even the turbulence of modern industrialism. Having a highly developed artistic instinct, which was at times unmatched by any commensurate talent, and was still more often (especially in the early editions) thwarted by his impulse toward propaganda, he was, as he said, "both in and out of the game"—he could criticize as well as create. The hiatuses in the record and the mystical indefiniteness of his expression render a precise statement of his Hegelian philosophy difficult; it is more profitable, however, as he rightly divined, to treat his purpose as fundamentally religious, however suggestive its philosophical and aesthetic implications. "No one will get at my verses who insists upon viewing them as aiming mainly towards art or aestheticism," he insisted; and if there be less truth in the statement to-day than when it was made, it is largely due to his own influence in widening our conception of the function of literature and art.

If Whitman be to-day the most vital literary force America can show, it is because he began by sitting at the feet of the world's greatest masters of song, imbibing something from every philosophy, every religion. His art, his thought, his form is modern because it is fundamentally eclectic. Doubtless Homer, Sophocles, Euripides, Epictetus, Dante, Cervantes, Shakespeare, Goethe, Rousseau, Carlyle, Shelley, "Ossian," Scott, Bryant, the Hindu scriptures, Emerson and many others, each long and intimately studied, often in the midst of wild nature, and checked against a wide experience with modern American life, gave him that transcendental self-respect which had courage to respond when the

mystical call came to him. And yet such large perception as his, freed him at once from mere imitation and the dread of inconsistency. There is room for Nature here, as well as God. Underlying his poems is what he called an "implicit belief in the wisdom, health, mystery, beauty of every process, every concrete object, every human or other existence, not only considered from the point of view of all, but of each."

Religion.—Viewing the future of America, Whitman came to believe that the safety of his country lay in a renaissance of the religious spirit. This was to be brought about, not through institutionalism but by the dissemination of good will and friendship and the creation of realistic and imaginative poetry which would reduce the school, church and State to mere instruments of national self-expression. That the modern world demanded a new image of manly virtue he was persuaded through his welcome acceptance of two ideas already fermenting 19th century thought; one was the shifting of authority in politics, taste and economics, from the favoured few to the many, from the traditions of the past to the claims of the future; the other idea was the new conception of history as an evolutionary growth according to natural law, which, while giving prominence to the natural sciences that sought to explain the concrete and the real tried also to relate life at any given moment to an infinite scheme of progress.

In America Whitman saw a symbol of that spiritual pioneering which, seeking perpetually a passage to India, links each age to a larger one. His "Prayer of Columbus" is a fitting tribute to the discoverer of America from its self-appointed poet. Yet with his idealism he blended a certain pagan epicureanism; while recognizing personal and social imperfections, he saw in them the very necessity out of which aspiration grows. In his attempt through *Leaves of Grass* to show forth the spirit of his country made flesh, Whitman did not need to claim the ascetic perfection which was the boast of early Puritans and prophets. The modern man he conceived to be fit to dwell in a world evolving through democracy, was proud, arrogant, just, tolerant, friendly, willing to treat woman as his equal, glorifying progress yet scorning material achievement as an end, suspicious of extremists yet indulging an intemperate relish for life and an unbounded faith in the future.

His poetry is to-day read in 25 different translations and claims more space in each new anthology and study of American literature. Its indirect effect already appears in a younger generation of writers of verse, fiction and biography, who find the Whitman of Victorian days strangely contemporary with an age of psychoanalysis, realistic fiction, frank treatment of sex, enfranchised womanhood, proudly self-conscious labour, and a growing spirit of international good-will.

(E. HOL.)

WHITMAN, a town of Plymouth county, Massachusetts, U.S.A., 20 m. S. by E. of Boston, adjoining Brockton; served by the New York, New Haven and Hartford railroad. Pop. (1920) 7,147 (85% native white). The town of South Abington was formed in 1875 from parts of Abington and East Bridgewater and in 1886 it changed its name to Whitman.

WHITNEY, ELI (1765–1825), American inventor, was born on a farm in Westboro (Mass.), on Dec. 8, 1765. He exhibited unusual mechanical ability at an early age and earned a considerable part of his expenses at Yale college, where he graduated in 1792. He soon went to Savannah (Ga.), and accepted the invitation of Mrs. Nathanael Greene, the widow of the revolutionary general, to spend some time on her plantation on the Savannah river, while deciding upon his future course. The construction by Whitney of several ingenious household contrivances led Mrs. Greene to introduce him to some gentlemen who were discussing the desirability of a machine to separate the short staple upland cotton from its seeds. In a few weeks Whitney produced a model, consisting of a wooden cylinder encircled by rows of slender spikes set half an inch apart, which extended between the bars of a grid set so closely together that the seeds could not pass, but the lint was pulled through by the revolving spikes; a revolving brush cleaned the spikes, and the seed fell into another compartment. The machine was worked by hand and could clean 50 lb. of lint a day. A patent was granted on March 14, 1794. Meanwhile Whitney had formed a partnership with Phineas Miller, and they built at New Haven (Conn.) a factory for the manufacture of the gins. They were unable to supply the demand for gins, and country blacksmiths constructed many machines. A patent, later annulled, was granted (May 12, 1796) to Hogden Holmes for a gin which substituted circular saws for the spikes. Whitney spent much time and money prosecuting infringements of his patent, and in 1807 its validity was settled. The South Carolina legislature voted $50,000 for the rights for that state, while North Carolina levied a licence tax for five years, from which about $30,000 was realized. Tennessee paid, perhaps, $10,000. Meanwhile Whitney, disgusted with the struggle, began the manufacture of fire-arms near New Haven (1798) and secured profitable government contracts; he introduced in this factory division of labour and standardized parts.

See Denison Olmsted, *Memoir* (1846); D. A. Tompkins, *Cotton and Cotton Oil* (Charlotte, N. C., 1901); and W. P. Blake, "Sketch of Eli Whitney," in New Haven Colony Historical Society *Papers*, vol. v. (1894).

WHITNEY, WILLIAM COLLINS (1841–1904), American political leader and financier, born at Conway, Mass., July 5, 1841. He graduated at Yale in 1863, studied law at Harvard, and began to practise in New York city. He actively allied himself with the anti-Tammany organization which successfully opposed the "Tweed Ring," and aided in the election of Samuel J. Tilden as governor in 1874. As corporation counsel of New York city (1872–82) he contested some 3,800 suits against the city, inherited from the Tweed régime, and he saved the municipality about $12,000,000. He did much in the way of organization to secure the election of Cleveland in 1884, and under him became Secretary of the Navy (1885–89). He played an important rôle in creating a more modern navy, especially in the building of armour-plated ships. After his term of office he reorganized the Manhattan street railways and established the Metropolitan Street Railway company. His work in 1892 overcame the efforts of T. C. Platt and Tammany Hall, through a "snap convention" to prevent the nomination of Cleveland for a second time. In 1896, disapproving of the "free-silver" agitation, he refused to support his party's candidate, William J. Bryan (*q.v.*). One of his last pieces of work was the organization of the New York Electric Light, Heat and Power company with a capital of $50,000,000. He died in New York city Feb. 2, 1904.

WHITNEY, WILLIAM DWIGHT (1827–1894), American philologist of New England stock, was born at Northampton, Mass., on Feb. 9, 1827. He graduated at Williams college with highest honours in 1845. Although he was at first interested in natural science, after 1848 he devoted himself with enthusiasm to Sanskrit, at that time a little-explored field of philological labour. After a brief course at Yale with Prof. Edward Elbridge Salisbury, then the only trained Orientalist in the United States, Whitney went to Germany (1850) and studied for three years

at Berlin and at Tübingen. In 1854 he was appointed professor of Sanskrit at Yale, and in 1869 professor of comparative philology also. In 1870 he received from the Berlin Academy of Sciences the first Bopp prize for the most important contribution to Sanskrit philology during the preceding three years—his edition of the *Tāittirīya-Prātiçākhya* (*Journal of the American Oriental Society,* vol. ix.). He died at New Haven, Conn., on June 7, 1894.

Whitney edited, with Professor Roth, the *Atharva-Veda-Sanhitā* (1855–56); published, with a translation and notes, the *Atharva-Veda-Prātiçākhya* (1862); made important contributions to the great Petersburg lexicon; issued an index verborum to the published text of the *Atharva-Veda* (*Journal of the American Oriental Society,* 1881); made a translation of the *Atharva-Veda,* books i.–xix., with a critical commentary, which he did not live to publish (edit. by Lanman, 1905); and published a large number of special articles upon various points of Sanskrit philology. His most notable achievement in this field, however, is his *Sanskrit Grammar* (1879). Whitney was editor-in-chief of *The Century Dictionary* (1889–91).

For a bibliography of Whitney's writings and for tributes to him see *The Whitney Memorial Meeting* edit. by C. R. Lanman (1897) and the *Journal of the American Oriental Society* (vol. xix. May 1897). *See* also the *Atlantic Monthly* (March 1895) for an article by C. R. Lanman.

WHITNEY, MOUNT, a peak near the southern extremity of the high Sierra Nevada in Inyo and Tulare counties, California. It is the highest (14,501 ft. above sea-level) summit of the United States, excluding Alaska. From its granite crest can be seen innumerable spires but little lower than its own, segregated by canyons of tremendous depth. Much of the ruggedness and beauty of the regions is due to the erosive action of many alpine glaciers that once existed on the higher summits. Only small patches of ice and snow now exist on its north side. Mt. Whitney was sighted in July 1864 by members of the California State Geological Survey, and was named in honour of their chief, Professor Josiah Dwight Whitney. The first ascent was made on Aug. 18, 1873 by John Lucas, Charles D. Begole and A. H. Johnson, all of Inyo county, Calif. In the same year, Sept. 19, it was climbed by Clarence King, who had failed by only a few hundred feet in 1864, while a member of the State Geological Survey.

See C. King, *Mountaineering in the Sierra Nevada* (1907); and John Muir, *The Mountains of California* (9th ed., 1911).

WHITSTABLE, a watering-place in the Canterbury parliamentary division of Kent, England, on the north coast at the east end of the Swale, 6 m. N.N.W. of Canterbury, on the S. railway. Pop. of urban district (1921) 9,842. The branch railway connecting Whitstable with Canterbury was one of the earliest in England, opened in 1830. Whitstable has been famous for its oyster beds from time immemorial.

WHITSUNDAY or PENTECOST, one of the principal feasts of the Christian Church, celebrated on the fiftieth (πεντηκοστή) day after Easter to commemorate the descent of the Holy Spirit on the disciples. The day became one of the three baptismal seasons, and the name Whitsunday is now generally attributed to the white garments formerly worn by the candidates for baptism on the vigil, as in the case of the *Dominica in albis.* The festival is the third in importance of the great feasts of the Church and the last of the annual cycle commemorating the Lord. It is connected with the Jewish Pentecost (*q.v.*), not only in the historical date of its origin (*see* Acts ii.), but in idea; the Jewish festival is one of thanks for the first-fruits of the earth, the Christian for the first-fruits of the Spirit. In the early Church the name of Pentecost was given to the whole fifty days between Easter and Whitsunday, which were celebrated as a period of rejoicing (Tertullian, *De idolatr.* c. 12, *De bapt.* 19, *De cor. milit.* 3, *Apost. Canons,* c, 37, *Council of Antioch,* A.D. 341, *can.* 20). As the designation of the fiftieth day of this period, the word Pentecost occurs for the first time in a canon of the council of Elvira (*c.* 305), which denounces as an heretical abuse the tendency to celebrate the 40th day (Ascension) instead of the 50th. There is plentiful evidence that the festival was regarded very early as one of the great feasts; Gregory Nazianzen (*Orat.* xliv. *De Pentec.*) calls it the "day of the Spirit" (ἡμέρα τοῦ Πνεύματος), and in 385 the *Peregrinatio Silviae* (*see* Duchesne, *Origines,* App.) describes its elaborate celebration at Jerusalem.

In the middle ages the Whitsun services were marked by many curious customs. Among those described by Durandus (*Rationale div. off.* vi. 107) are the letting down of a dove from the roof into the church, the dropping of balls of fire, rose-leaves and the like. Whitsun is one of the Scottish quarter-days, and though the Church festival is movable, the legal date was fixed for the 15th of May by an act of 1693. Whit-Monday, which, with the Sunday itself, was the occasion for the greatest of all the mediaeval church ales, was made an English Bank Holiday by an act passed on the 25th of May 1871.

See Duchesne, *Origines du culte Chrétien* (1889); W. Smith and Cheetham, *Dic. of Christian Antiquities* (1874–1880); Herzog-Hauck, *Realencyklopädie* (1904), xv. 254, s.v. "Pfingsten." For the many superstitions and observances of the day *see* P. H. Ditchfield, *Old English Customs* (1897); Brand, *Antiquities of Great Britain* (Hazlitt's edit., 1905); B. Picart, *Cérémonies et coutumes religieuses de tous les peuples* (1723).

WHITTIER, JOHN GREENLEAF (1807–1892), America's "Quaker poet," was born in a Merrimack valley farmhouse, Haverhill (Mass.), Dec. 17, 1807. The dwelling was built in the 17th century by his ancestor, the sturdy immigrant, Thomas Whittier, notable through his efforts to secure toleration for the disciples of George Fox in New England. The poet was born in the Quaker faith, and adhered to its liberalized tenets, its garb and speech, throughout his lifetime. His father, John, was a farmer of limited means but independent spirit. His mother, Abigail Hussey, whom the poet strongly resembled, was of good colonial stock. In addition to this nonconformist ancestry there was Huguenot blood on both sides of the family; the poet thus fairly inherited his conscience, religious exaltation, and spirit of protest.

Whittier's early education was restricted to what he could gain from the primitive district school of the neighbourhood. His call as a poet came when a teacher lent him the poems of Burns. He was then about 14, and his taste for writing, bred thus far upon the quaint journals of Friends, the Bible, and *The Pilgrim's Progress,* was at once stimulated. There was little art or inspiration in his boyish verse, but in his 19th year an older sister thought one poem good enough for submission to the *Free Press,* a weekly paper which William Lloyd Garrison, the future emancipationist, had started in the town of Newburyport. This initiated Whittier's literary career. The poem was printed with a eulogy and the editor sought out his young contributor; their alliance began and continued until the triumph of the anti-slavery cause 37 years later. Garrison and A. W. Thayer of the *Haverhill Gazette* urged further schooling for the gifted lad, the latter friend offering the hospitality of his own home. To meet expenses at the Haverhill academy Whittier worked variously. Meanwhile he had written creditable student verse and contributed to newspapers, thus gaining friends and obtaining a decided if provincial reputation. He soon essayed journalism, editing in Boston the *American Manufacturer,* an organ of the Clay protectionists, and contributing to the *Philanthropist,* devoted to humane reform. After a year and a half his father's last illness recalled him to the homestead, where both farm and family became his charge. For six months in 1830 he edited the *Haverhill Gazette,* contributing also to the *New England Review* in Hartford (Conn.), the editorship of which George D. Prentice transferred to him. Called home to aid in the settlement of his father's estate, he fell ill, conducted his periodical from home, and then returned for a brief time to Hartford. After his resignation at the end of 1831, he worked on the farm with his brother, doing his writing at night. Poverty, bodily exhaustion, disappointed love, and ambition caused this to be one of the most unhappy periods of his life. The sale of the farm in 1836 and removal to the pleasant cottage at Amesbury lightened his physical burdens, however, and the crusade against slavery provided him with an ennobling object for his passionate and selfless devotion. He was a delegate to the Philadelphia convention in 1833 that formed the Anti-Slavery Society, and was appointed one of the committee that drafted the famous Declaration of Sentiments. Although a Quaker, he had a polemical spirit; men

seeing Whittier only in his saintly age knew little of the fire wherewith, setting aside ambition and even love, he maintained his warfare against the "national crime," employing action, argument, and lyric scorn. In 1833 he issued at his own cost a pamphlet, *Justice and Expediency; or, Slavery Considered with a View to its Rightful and Effectual Remedy, Abolition,* that provoked vehement discussion north and south.

In spite of the fact that illness prevented his serving his second term in the State legislature, of which he had been a member in 1835, his record throughout the 1830's is one of constant labour for the cause of abolition—at home, in Harrisburg (Pa.), in Boston, in New York, and in Philadelphia. After 1840 serious heart trouble necessitated his retiring to Amesbury, but the establishment in Washington of the *National Era* under Dr. Gamaliel Bailey gave him a new outlet for his labours. To this famous abolition paper, of which he was corresponding editor, he contributed for more than a decade the reviews, editorials, and the stirring verse which made him the poet-seer of the emancipation struggle. His sister Elizabeth, who became his life companion, and whose verse is preserved with his own, was president of the Woman's Anti-Slavery Society in Amesbury. The first collection of Whittier's lyrics was the *Poems written during the Progress of the Abolition Question in the United States,* issued in 1837, though the first authorized edition was the *Poems* of 1838.

As early as 1828 Mr. Thayer had attempted to get the *Poems of Adrian* published by subscription, and while in Hartford Whittier had issued his first book, *Legends of New England* (1831), in prose and verse, and edited the *Literary Remains* (1832) of the poet John G. C. Brainard. For all his early verse, including *Mogg Megone* (1836), a crude attempt to apply Scott's romantic method to a native theme, he apologized in later life and suppressed the pieces entirely or banished them to the oblivion of an appendix. Pre-war volumes which reveal the development of his power are *Lays of my Home* (1843), *Voices of Freedom* (1846), *Songs of Labor* (1850), *The Chapel of the Hermits* (1853), *The Panorama* (1856), *Home Ballads* (1860). The titles of *In War Time* (1863) and *National Lyrics* (1865) designate the patriotic rather than Tyrtaean contents of these books. The poet was closely affiliated with the *Atlantic Monthly* from the foundation of that magazine in 1857. The consequent growth of his reputation and the welcome awarded to *Snow-Bound* in 1866 brought a corresponding material reward. Of his later books of verse may be mentioned *The Tent on the Beach* (1867), *The Pennsylvania Pilgrim* (1872), *The Vision of Echard* (1878), *The King's Missive* (1881), *At Sundown,* his last poems (1890). As early as 1849 an illustrated collection of his poems appeared, and his *Poetical Works* were issued in London in 1850. During the ensuing 40 years no fewer than ten collections of his poems appeared. Meanwhile, he did much editing and compiling, and produced, among other works in prose, *The Stranger in Lowell* (1845); *The Supernaturalism of New England* (1847); *Leaves from Margaret Smith's Journal* (1849), a charming narrative of colonial days; and *Old Portraits and Modern Sketches* (1850). When he died on Sept. 7, 1892, in Hampton Falls, New Hampshire he had been an active writer for over 60 years, leaving more than that number of publications which bore his name as author or editor. His body was brought to Amesbury for interment. The Amesbury house has been acquired by the "Whittier Home Association."

It would be unjust to consider Whittier's genius from an academic point of view. As a poet he was essentially a balladist, with the faults of his qualities; and his ballads, in their freedom, naïveté, even in their undue length, are among the few modern examples of unsophisticated verse. Such pieces as "Barclay of Ury" or "Skipper Ireson's Ride" are perhaps the best American examples of this form. Whittier became very sensible of his shortcomings; and when at leisure to devote himself to his art he greatly bettered it. It is necessary always to take into consideration his own explanation that many of his poems "were written with no expectation that they would survive the occasions which called them forth; they were protests, alarm signals, trumpet-calls to action, words wrung from the writer's heart, forged at white heat, and of course lacking the finish which reflection and patient brooding over them might have given." The inward voice was his inspiration, and of all American poets he was the one whose song was most like a prayer. A knightly celibate, his stainless life, his ardour, caused him to be termed a Yankee Galahad; a pure and simple heart was laid bare to those who loved him in "My Psalm," "My Triumph," and "An Autograph." The spiritual habit abated no whit of his inborn sagacity, and it is said that in his later years political leaders found no shrewder sage with whom to take counsel. In spite of his technical defects the fact remains that no other poet has sounded more native notes or covered so much of the American legendary, and that Whittier's name among the patriotic, clean and true, was one with which to conjure.

BIBLIOGRAPHY.—Before his death Whittier revised his works, classifying them for a definitive edition in seven volumes (1888–89), which has been used as a basis for all subsequent editions. H. E. Scudder edited the one-volume Cambridge edition of Whittier's verse (1894). The poet's *Life and Letters,* prepared by his kinsman and literary executor, Samuel T. Pickard, appeared in 1894. *Whittier's Unknown Romance; Letters to Elizabeth Lloyd* was published with an introduction by Marie V. Denervaud in 1922; John Albree edited *Whittier Correspondence from the Oak Knoll Collections* (1911); S. T. Pickard issued *Whittier as a Politician; illustrated by his Letters to Professor Elizur Wright, Jr.* (1900). Biographies of Whittier are: Richard Burton (1901), G. R. Carpenter (1903), T. W. Higginson (1902), W. S. Kennedy (enlarged ed., 1892), W. J. Linton (1893), Bliss Perry (1907), and F. H. Underwood (1884). Personal reminiscences were given by Mrs. Mary B. Claflin (1893), Mrs. James T. Fields (1893), Frances C. Sparhawk (1925), and Edmund Gosse in *Portraits and Sketches* (1912). S. T. Pickard's *Whittier-Land* (1904) presented hitherto unpublished material. *See* also essays in A. H. Strong's *American Poets and Their Theology* (1916) and Barrett Wendell's *Stelligeri* (1893) and the bibliography in the *Cambridge History of American Literature* (vol. ii. pp. 436–451).

WHITTIER, a city of Los Angeles county, California, U.S.A., 13 m. S.E. of the business centre of Los Angeles, on the slopes of the Puente hills, at the entrance to Turnbull Canyon. Pop. (1920) 7,997 (92% native white); (1928 local estimate) 16,500. Whittier is primarily a residential city and a shipping point for oranges, lemons, walnuts, avocados and oil. It is the seat of the State school for boys, and of Whittier college (non-sectarian; established by the Society of Friends in 1901). The city was founded by Quakers, in 1887, and was named after John Greenleaf Whittier. It was incorporated as a city in 1898.

WHITTINGHAM, CHARLES (1767–1840), English printer, was born on June 16, 1767, at Caludon, Warwickshire, and was apprenticed to a Coventry printer. In 1789 he set up a printing press in London, started a paper-pulp factory in Chiswick in 1809, and in 1811 founded the Chiswick press. He was a pioneer of cheap reprints of the classics, was the first to use proper overlays in printing woodcuts, and was also the first to print a fine or "Indian paper" edition. He died at Chiswick on Jan. 15, 1840. His nephew and partner, Charles Whittingham (1795–1876), removed the whole business to London in 1852. Under him the Chiswick press increased its reputation.

WHITTINGTON, RICHARD (d. 1423), mayor of London, described himself as son of William and Joan (Dugdale, *Monasticon Anglicanum,* vi. 740). This enables him to be identified as the third son of Sir William Whittington of Pauntley in Gloucestershire, who married after 1355 Joan, daughter of William Mansel, and widow of Thomas Berkeley of Cubberley. Richard was a mercer by trade, and entered on his commercial career under favourable circumstances. He married Alice, daughter of Sir Ivo Fitzwaryn, a Dorset knight of considerable property; his wife predeceased him. Whittington sat in the common council as a representative of Coleman Street Ward, was elected alderman of Broad Street in March 1393, and served as sheriff in 1393–1394. When Adam Bamme, the mayor, died in June 1397, Whittington was appointed by the king to succeed him, and in October was elected mayor for 1398. He had acquired great wealth and much commercial importance, and was mayor of the staple at London and Calais. He made frequent large loans both to Henry IV. and Henry V., and according to the legend, when he gave a banquet to the latter king and his queen in 1421, completed the entertainment by burning bonds for £60,000, which he had taken up and discharged. Henry V. employed him to superintend the expenses for completing Westminster Abbey. But Whittington

took no great part in public affairs. He was mayor again in 1406–1407, and in 1419–1420. He died in March 1423 bequeathing his vast fortune to charitable and public purposes. He joined in procuring Leadenhall for the city, and bore nearly all the cost of building the Greyfriars Library. In his last year as mayor he had been shocked by the foul state of Newgate prison, and one of the first works undertaken by his executors was its rebuilding. His executors, chief of whom was John Carpenter, the famous town clerk, also contributed to the cost of glazing and paving the new Guildhall, and paid half the expense of building the library there; they repaired St. Bartholomew's hospital, and provided bosses for water at Billingsgate and Cripplegate. But the chief of Whittington's foundations was his college at St. Michael, Paternoster church, and the adjoining hospital. The college was dissolved at the Reformation, but the hospital or almshouses are still maintained by the Mercers' Company at Highgate. Stow relates that his tomb in St. Michael's church was spoiled during the reign of Edward VI., but that under Mary the parishioners were compelled to restore it (*Survey*, i. 243). There is no proof that he was ever knighted. A writer of the next generation bears witness to his commercial success in *A Libell of English Policy* by styling him "the sunne of marchaundy, that lodestarre and chief-chosen flower."

> Pen and paper may not me suffice
> Him to describe, so high he was of price.

Popular legend makes Dick Whittington a poor orphan employed as a scullion by the rich merchant, Sir Hugh Fitzwarren, who ventures the cat, his only possession, on one of his master's ships. Distressed by ill-treatment he runs away, but turns back when he hears from Holloway the prophetic peal of Bow bells. He returns to find that his venture has brought him a fortune, marries his master's daughter, and succeeds to his business. The legend is not referred to by Stow, who would assuredly have noticed it if it had been well established when he wrote. The first reference to the story comes with the licensing in 1605 of a play, now lost, *The History of Richard Whittington, of his lowe byrth, his great fortune*. "The legend of Whittington," probably meaning the play of 1605, is mentioned by Beaumont and Fletcher in 1611 in *The Knight of the Burning Pestle*. When a little later Robert Elstracke, the engraver, published a supposed portrait of Whittington with his hand resting on a skull, he had in deference to the public fancy to substitute a cat; copies in the first state are very rare. Thomas Keightley traced the cat story in Persian, Danish and Italian folk-lore as far back as the 13th century.

Bibliography.—The most important early references to Whittington are contained in Dr. R. R. Sharpe's *Calendar of Letter-book H.* (1907); H. T. Riley's *Memorials of London* (1868); and *Political Songs*, ii. 178 (Rolls series). For his charities *see* Stow's Survey of *London* (ed. C. L. Kingsford, 1908). For documents relating to Whittington College *see* Dugdale, *Monasticon Anglicanum* (1693; 1846), vi. 740, and the *Calendar of Patent Rolls, Henry VI.* (1900); ii. 214–217. Samuel Lysons collected the facts, but accepted the legend in *The Model Merchant of the Middle Ages* (1860). The *Life* (new ed. 1894) by W. Besant and J. Rice does not improve on Lysons. Some useful references will be found in J. H. Wylie's *History of England under Henry IV.* (4 vols. 1884–98). For an examination of the legend *see* T. Keightley's *Tales and Popular Fictions*, pp. 241–286 (1834), and H. B. Wheatley's preface to his edition of *The History of Sir Richard Whittington* (first published in 1656). (C. L. K.)

WHITTINGTON, urban district, Derbyshire, England, 10 m. S. of Sheffield and 2 m. N. of Chesterfield, on the L.M.S. railway. Pop. (1921) 7,617. The parish church of St. Bartholomew was restored after its destruction by fire, in 1895. Stone bottles and coarse earthenware are manufactured in the town, where there are also large ironworks, collieries and brickworks.

WHITTLESEY, a town in Cambridgeshire, England, 5¼ m. E. of Peterborough, between that city and March, on the L.N.E.R. Pop. (1921) 4,207. To the north is the artificial cut carrying the waters of the river Nene; the neighbourhood is intersected with many other navigable "drains." To the south-west is Whittlesey Mere, 6 m. distant from the town, in Huntingdonshire. It was a lake until modern times, when it was included in a scheme of drainage. The town manufactures bricks and tiles, and has a considerable agricultural trade.

WHITWORTH, SIR JOSEPH, Bart. (1803–1887), English engineer, was born at Stockport, near Manchester, on Dec. 21, 1803. On leaving school at fourteen, he was placed with an uncle who was a cotton-spinner, with a view to becoming a partner; but this occupation did not suit his mechanical tastes, and after about four years he gave it up. He then spent some time with various machine manufacturers in the neighbourhood of Manchester, and in 1825 moved to London.

In 1833 he returned to Manchester and started business as a tool-maker. In 1840 at the meeting of the British Association at Glasgow, he read a paper on the preparation and value of true planes which indicated an accuracy of workmanship far ahead of what was considered possible in mechanical engineering at that time. In 1841, in a paper read before the Institute of Civil Engineers, he urged the necessity for the adoption of a uniform system of screw threads in place of the various heterogeneous pitches then employed. His system of standard gauges was also widely adopted, and his principles of exact measurement and workmanship were strictly observed in his own factory, with the result that in the Exhibition of 1851 he had a show of machine tools far ahead of that of any competitor.

It was doubtless this superiority in machine construction that caused the government three years later to request him to design, and estimate the cost of making the machinery for producing rifled muskets at the new factory at Enfield. He did not agree to the proposal in this form, but it was ultimately settled that he should construct the machinery for the barrels only. Finding that there was no established practice to guide him, he began a series of experiments to determine the best principles for the manufacture of rifle barrels and projectiles. He ultimately arrived at a weapon in which the necessary rotation of the projectile was obtained, not by means of grooving, but by making the barrel polygonal in form, with gently rounded angles, the bullets also being polygonal and thus travelling on broad bearing-surfaces along the rotating polygon. It is reported that at the trial in 1857 weapons made according to these principles excelled the Enfield weapons in accuracy of fire, penetration and range to a degree "which hardly leaves room for comparison." He also constructed heavy guns on the same lines; these were tried in competition with Armstrong's ordnance in 1864 and 1865, and in their inventor's opinion gave the better results, but they were not adopted by the government. In constructing them Whitworth found difficulty in getting large steel castings of suitable soundness and ductility, and thus in 1870 was led to devise his compressed steel process, in which the metal was subjected to high pressure while still in the fluid state, and afterwards forged in hydraulic presses, instead of by hammers.

In 1868 he founded the Whitworth scholarships, setting aside an annual sum of £3,000 to be given for "intelligence and proficiency in the theory and practice of mechanics and its cognate sciences," and in the following year he was created a baronet. He died at Monte Carlo on Jan. 22, 1887. In addition to giving £100,000 for the permanent endowment of 30 Whitworth scholarships, his residuary legatees, in pursuance of what they knew to be his intentions, expended over half a million on charitable and educational objects, mainly in Manchester and the neighbourhood.

WHOOPING-COUGH or Hooping-Cough (syn. *Pertussis*, Chin-cough), a specific infective disease starting in the respiratory mucous membrane, depending on a cocco-bacillus described by Bordet and Gengon in 1906 (*see* Parasitic Diseases), and manifesting itself by frequently recurring paroxysms of convulsive coughing accompanied with peculiar sonorous inspirations (or whoops). Although specially a disease of childhood, whooping-cough may occur at any time of life. There is a distinct period of incubation variously estimated at from two to ten days.

The *first stage* is characterized by the ordinary phenomena of a catarrh, but the presence of an ulcer on the fraenum linguae is said to be diagnostic. The catarrhal stage usually lasts from ten to fourteen days. The *second stage* is marked by abatement of the catarrhal symptoms, but increase in the cough, which now occurs in irregular paroxysms both by day and by night. This stage of the disease usually continues for from one to two months. Pos-

sible complications are bronchopneumonia (*see* BRONCHITIS), and convulsions. When, however, the disease progresses favourably, the cough becomes less frequent and generally loses in great measure its "whooping" character.

There is no specific treatment for whooping-cough; sunlight or, in its absence, ultra-violet light, with plenty of open air, is beneficial.

WHYMPER, EDWARD (1840–1911), British artist, explorer and mountaineer, was born in London on April 27, 1840. The son of an artist, he was at an early age trained to the profession of a wood-engraver. In 1860 he was commissioned to make a series of sketches of Alpine scenery, and undertook an extensive journey in the Central and Western Alps. Among the objects of this tour was the illustration of an attempt, which proved unsuccessful, made by Professor Bonney's party, to ascend Mont Pelvoux, at that time believed to be the highest peak of the Dauphiné Alps. He successfully accomplished the ascent in 1861 —the first of a series of expeditions that threw much light on the topography of a district at that time very imperfectly mapped. From the summit of Mont Pelvoux he discovered that it was overtopped by a neighbouring peak, subsequently named the Pointe des Écrins, which, before the annexation of Savoy added Mont Blanc to the possessions of France, was the highest point in the French Alps. Its ascent by Whymper's party in 1864 was perhaps the most remarkable feat of mountaineering up to that date. The years 1861 to 1865 are filled with a number of new expeditions in the Mont Blanc group and the Pennine Alps, among them being the ascent of the Aiguille Verte and the crossing of the Moming Pass. Professor Tyndall and Mr. Whymper emulated each other in fruitless attempts to reach the summit of the Matterhorn by the south-western or Italian ridge. Mr. Whymper, six times repulsed, determined to attempt the eastern face, convinced that its precipitous appearance when viewed from Zermatt was an optical illusion, and that the dip of the strata, which on the Italian side formed a continuous series of overhangs, should make the opposite side a natural staircase. His attempt (the seventh) by what is now the usual route was crowned with success (July 14, 1865); but on the descent four of the party slipped and were killed, and only the breaking of the rope saved Whymper and the two remaining guides from the same fate.

The account of his attempts on the Matterhorn occupies the greater part of his *Scrambles among the Alps* (1871), in which the illustrations are engraved by the author himself. He visited Greenland in 1867, with a view to crossing the interior. Another expedition in 1872 convinced him that the enterprise was too great for a private expedition. But his visits resulted in valuable collections of fossils, trees and shrubs.

He next organized an expedition to Ecuador, designed primarily to collect data for the study of mountain-sickness and of the effect of diminished pressure on the human frame. He took as his chief guide Jean-Antoine Carrel, whose subsequent death from exhaustion on the Matterhorn after bringing his employers into safety through a snowstorm forms one of the noblest pages in the history of mountaineering. During 1880 Whymper on two occasions ascended Chimborazo, whose summit, 20,500 ft. above sea-level, had never before been reached; spent a night on the summit of Cotopaxi, and made first ascents of half-a-dozen other great peaks. In 1892 he published the results of his journey in a volume entitled *Travels amongst the Great Andes of the Equator,* in which he made useful observations, among other things, on mountain sickness. The collections of rock specimens and volcanic dust brought back from this journey were described by Dr. Bonney in the *Proc. Roy. Soc.* (Nos. 229–234). In 1901–1905 he undertook an expedition in the region of the Great Divide of the Canadian Rockies. Whymper died at Chamonix on Sept. 16, 1911.

See articles by T. G. Bonney in *Alpine Journal* (Feb. 1912), and by D. W. Freshfield in the *Dict. Nat. Biog.* (Second Supplement).

WHYTE, ALEXANDER (1837–1921), Scottish divine, was born at Kirriemuir in Forfarshire on Jan. 13, 1837, and was educated at the University of Aberdeen and at King's college, Edinburgh. He entered the ministry of the Free Church of Scotland and after serving as colleague in Free St. John's, Glasgow (1866–70), removed to Edinburgh as colleague (1870–73) and successor (1873–1916) to Dr. R. S. Candlish at Free St. George's. In 1898 he was elected moderator of the General Assembly. In 1909 he succeeded Dr. Marcus Dods as principal, and professor of New Testament literature, at New College, Edinburgh. He held this post until 1918. He died in London on Jan. 6, 1921.

Among his publications are *Characters and Characteristics of William Law* (1893); *Bunyan Characters* (3 vols., 1894); *Samuel Rutherford* (1894); *An Appreciation of Jacob Behmen* (1895); *Lancelot Andrewes and his Private Devotions* (1895); *Bible Characters* (7 vols., 1897); *Santa Teresa* (1897); *Father John of Cronstadt* (1898); *An Appreciation of Browne's Religio Medici* (1898); *Cardinal Newman, An Appreciation* (1901). *See* G. F. Barbour, *Life of Alexander Whyte* (1923).

WHYTE-MELVILLE, GEORGE JOHN (1821–1878), English novelist, son of John Whyte-Melville of Strathkinness, Fifeshire, and grandson on his mother's side of the 5th duke of Leeds, was born on June 19, 1821. Whyte-Melville received his education at Eton, entered the army in 1839, became captain in the Coldstream Guards in 1846 and retired in 1849. After translating Horace (1850) in fluent and graceful verse, he published his first novel, *Digby Grand,* in 1853. The unflagging verve and intimate technical knowledge with which he described sporting scenes and sporting characters at once drew attention to him as a novelist with a new vein. He was the laureate of fox-hunting; all his most popular and distinctive heroes and heroines, Digby Grand, Tilbury Nogo, the Honourable Crasher, Mr. Sawyer, Kate Coventry, Mrs. Lascelles, are or would be mighty hunters. *Tilbury Nogo* was contributed to the *Sporting Magazine* in 1853 and published separately in 1854. He showed in the adventures of Mr. Nogo—and it became more apparent in his later works—that he had a surer hand in humorous narrative than in pathetic description. He lost his life in the hunting-field on Dec. 5, 1878.

The Gladiators was perhaps the most famous of his numerous historical novels. He also wrote *Songs and Verses* (1869) and a metrical *Legend of the True Cross* (1873).

WICHITA, a city of Kansas, U.S.A., on the Arkansas river at the mouth of the Little Arkansas, 200 m. S.W. of Kansas City and 1,300 ft. above sea-level; the county seat of Sedgwick county and the second city of the State in size. It is on Federal highways 54 and 81 and the airway from Chicago to Mexico and the Gulf; has a municipal airport a mile square; and is served by the Frisco, the Kansas City, Mexico and Orient, the Midland Valley, the Missouri Pacific, the Rock Island, the Santa Fe, and electric railways. Pop. (1925) 88,367 (91% native white); estimated locally at 105,000 in 1928. It is the commercial, financial, and industrial metropolis of southern Kansas and northern Oklahoma. Its banking transactions, whether on the basis of clearings ($425,000,000 in 1927) or of debits to individual accounts ($628,605,000) are greater by far than those of any other city in the State. Its stock yards handle 25,000 carloads and 75,000 truckloads of live stock in a year; its packing plants send out 150,000,000 lb. of meat products; and its flour-mills have a daily capacity of 11,000 barrels. Wichita is a leading centre for the manufacture of aeroplanes, aeroplane motors, parts and equipment. An aeroplane factory was established in 1919, and in 1928 about 1,000 persons were employed in the industry. Since 1909 the city has operated under a commission-manager form of government. A municipal university was established in 1926, to which were transferred the properties of Fairmount college. Friends university, in the western part of the city, was founded and is supported by the Kansas Yearly Meeting of Friends. The city's assessed valuation of property for 1928 was $135,169,071.

Wichita was the name of a tribe of Indians. The city was founded in 1870 and chartered in 1871. In 1880 it had a population of only 4,911.

WICHITA FALLS, a city of northern Texas, U.S.A., 100 m. N.W. of Fort Worth, on the Wichita river near the Red river, at an altitude of 946 ft.; the county seat of Wichita county and one of the principal trading centres of the South-west. It is on Federal highways 70 and 370, and is served by the Fort Worth and Denver City, the Missouri-Kansas-Texas, the Wichita Falls and

Southern, and the Wichita Valley railways. The population was 40,079 in 1920 (90% native white) and was estimated locally at 60,000 in 1928. Wichita Falls is surrounded by extensive gas and oil fields and an agricultural region devoted to stock-raising, dairying and the cultivation of cotton, wheat, corn and fruit. Its manufactures (including 14 oil refineries) are numerous and varied, with an output in 1925 valued at $26,583,573. There are many oilfield supply houses and large wholesale and jobbing firms. The city's assessed valuation of property for 1927 was $45,100,060. The city was founded in 1874 and incorporated in 1876.

WICK, royal, municipal and police burgh, parish, seaport and county town of Caithness, Scotland. Pop. (1921) 8,115. It is situated at the head of Wick bay, on the North sea, 327 m. N. of Edinburgh, by the L.N.E. and L.M.S. railways. It consists of the old burgh and Louisburgh, its continuation, on the north bank of the river Wick, and of Pulteneytown, the commercial quarter, on the south side. Wick is the chief Scottish centre of the herring fisheries. Wick (Vik or "bay") is mentioned as early as 1140. It was constituted a royal burgh by James VI. in 1589.

WICKHAM, SIR HENRY (1846–1928), English pioneer and explorer, was born on May 29, 1846, and later went to Brazil as a planter. He was led to experiment with rubber trees, but found great difficulty in obtaining financial support for his schemes. In 1872 he published his book *A Journey through the Wilderness,* and as a result the India office employed him to collect seeds of the *Hevea braziliensis.* He evaded the vigilance of the Brazilian Government, and brought back a large number of seeds which were planted in the glass-houses of Kew Gardens, and eventually formed the basis of the whole plantation rubber industry of the East. Wickham held posts as inspector of forests and commissioner of Crown Lands in India, police inspector and magistrate in British Honduras, and for 50 years explored Central America, Australia, New Guinea, and the Pacific islands, establishing many pioneer rubber plantations. In 1911 he received 1,000 guineas and an annuity from the rubber growers and planters associations of London, Ceylon and Malaya, and in 1920 was knighted. He died on Sept. 27, 1928.

WICKLOW, a county of Ireland in the province of Leinster, bounded east by St. George's Channel, north by the county of Dublin, south by Wexford and west by Carlow and Kildare. The area is 500,216 ac. or about 782 sq. miles. Pop. (1926) 57,583. The coast is very dangerous of approach owing to sandbanks. The harbour at Wicklow has a considerable trade; but that of Arklow is suitable only for small vessels. The central portion of the county is occupied by a granitic mountain range, running from north-east to south-west, the highest summits being Kippure (2,473 ft.), Duff Hill (2,364), Table Mountain (2,416) and Lugnaquilla (3,039). The range rises from the north by a succession of ridges intersected by deep glens, and subsides towards the borders of Wexford and Carlow. To the north its foothills enter co. Dublin, and add attraction to the southern residential outskirts of the capital. The water-supply of Dublin is obtained from an artificial lake on the first plateau of the foothills at Roundwood.

In the valleys there are many instances of old river terraces, especially at the lower end of Glenmalure and the lower end of Glendalough. Among the more famous of the glens are Glendalough, Dargle, Glencree, Glen of the Downs, Devil's Glen, Glenmalure and the beautiful vale of Avoca or Ovoca. The principal rivers are the Liffey, on the north-western border; the Vartry, which passes through Devil's Glen to the sea north of Wicklow Head; the Avonmore and the Avonbeg, which unite at the "meeting of the waters" to form the Avoca, which is afterwards joined by the Aughrim and falls into the sea at Arklow; and the Slaney, in the west of the county, passing southwards into Carlow. The principal lakes are Loughs Dan, Bray and Tay or Luggelaw, and the loughs of Glendalough. The trout-fishing is generally fair.

Wicklow was not made a county until 1606. It was the last Irish ground shired, for in this mountainous district the Irish were long able to preserve independence. Wicklow sided with the royal cause during the Cromwellian wars, but on Cromwell's advance submitted to him without striking a blow. During the rebellion of 1798 there were skirmishes at Aughrim and at Arklow.

Of the ancient cromlechs there are three of some interest, one near Enniskerry, another on the summit of Lugnaquilla and a third at Donaghmore. The ruins in the vale of Glendalough, known as the "seven churches," including a round tower, owe their origin to St. Kevin, who lived in the vale as a hermit, and is reputed to have died in 618. Of the old fortalices or strongholds those of special interest are Black Castle, near Wicklow, originally founded by the Norman invaders, but taken by the Irish in 1301, and afterwards rebuilt by William Fitzwilliam; the scattered remains of Castle Kevin, the stronghold of the O'Tooles, by whom it was probably originally built in the 12th century; and the ruins of the castle of the Ormondes at Arklow, founded by Theobald Fitz-Walter (d. 1285), and demolished by Cromwell in 1649, and now containing within the interior of its ruined walls a constabulary barrack. The mansion of Powers-court occupies the site of an old fortalice founded by De la Poer, one of the knights who landed with Strongbow; in the reign of Henry VIII. it was taken by the O'Tooles and O'Brynes.

The lower land is fertile; and the higher districts, covered with heath and turf, afford good pasturage for sheep. There is a considerable extent of natural timber as well as artificial plantations. The principal crops of oats and potatoes decrease considerably, but the numbers of sheep, cattle, pigs and poultry are well maintained.

A considerable amount of gold has been extracted from the valley-gravels north of Croghan Kinshela on the Wexford border. Tinstone has also been found in small quantities. Lead-ore is raised west of Laragh, and the mines in the Avoca valley have been worked for copper, lead and sulphur, the last-named being obtained from pyrite. Paving-setts are made from the diorite at Arklow, and granite is extensively quarried at Ballyknockan on the west side of the mountain-chain.

Owing to its proximity to Dublin and its accessibility from England, the portions of the county possessing scenic interest have been opened up to great advantage. Bray in the north is a seaside resort. Inland tourist centres are Enniskerry, west of Bray, and near the pass of the Scalp; Laragh, near Glendalough, from which a military road runs south-west across the hills below Lugnaquilla; and, on the railway south of Wicklow, Rathdrum, Woodenbridge in the Vale of Avoca and Aughrim.

The Great Southern railway skirts the coast by way of Bray and the town of Wicklow, touching it again at Arklow, with a branch line from Woodenbridge junction to Shillelagh. Another branch from Sallins (Co. Kildare) skirts the west of the county by Baltinglass.

The administrative county of Wicklow returns three members to Dáil Eireann.

WICKLOW, a seaport, and county town of co. Wicklow, Ireland, at the mouth of a lagoon which receives the River Vartry and other streams, 28¼ m. S. of Dublin by the Great Southern railway. Pop. (1926), 3,027. The harbour can accommodate vessels of 1,500 tons and has two piers, with quayage. The name shows the town to have been a settlement of the Norsemen.

WIDGEON, an abundant species of duck, *Anas penelope,* breeding in Europe and northern Asia and reaching northern Africa and India in winter. Intermediate in size between the teal and the mallard, the widgeon drake is a handsome bird with cream forehead, chestnut head and neck, pencilled grey flanks and green and black speculum (wing-bar). Its whistling cry has given it the local name of "whew-duck." The widgeon collects in huge flocks on tidal waters in winter and is shot for market in large numbers. When on land it often eats grass. Two allied species occur in America, of which *A. americana,* the baldpate, inhabits northern America, reaching Central America and Trinidad in winter; it differs in that the head is black, speckled with buff. The other species, *A. sibilatrix,* is South American.

WIDMANN, JOSEPH VICTOR (1842–1911), poet, dramatist, novelist and literary critic, was born at Nennowitz (Moravia) on Feb. 20, 1842, and died at Bern on Nov. 6, 1911. In 1880 he became *feuilleton* editor of the *Berner Bund,* and in this capacity he exercised for 30 years an authoritative sway as critic of German and German-Swiss literature. Among the

most important of his own works are *Arnold von Brescia* (1867), a tragedy; *Buddha* (1869), a philosophic epic, which might be described as a forerunner of Nietzsche's *Also Sprach Zarathustra* and Spitteler's *Prometheus und Epimetheus; Mose und Zipora* (1874), an idyll; *Oenone* (1880), a drama; *Die Patriezerin* (1888), a novel of life in Bern; *Die Maikäferkomödie,* "Cockchafer Comedy" (1897), a charming allegorical play, which may possibly have furnished Rostand with the idea of *Chantecler;* and *Der Heilige und die Tiere* (1905), another dramatic poem in which his interest in the animal world and its right to poetic existence are demonstrated. The last is his profoundest poetical utterance. Widmann was one of the first to champion the genius of Carl Spitteler (*q.v.*), with whom his friendship dated from childhood days at Liestal.

See the *Life* by E. and M. Widmann (2 vols.; 1922–24); the studies by Maria Waser (1927), Prof. Jonas Fränkel (1918), W. Scheitler (1925); and the *Briefwechsel Keller-Widmann* (1922).

WIDNES, municipal borough, Widnes parliamentary division of Lancashire, England, on the Mersey, 12 m. S.E. from Liverpool on the L.M.S. and Cheshire lines. Pop. (1921) 38,860. It is wholly of modern growth, for in 1851 the population was under 2,000. There are capacious docks on the river, which is crossed, and the town connected with Runcorn, by a railway bridge and a transporter bridge. Widnes is one of the principal seats of the alkali and soap manufacture, and has also grease-works for locomotives and waggons, copper works, iron-foundries, oil and paint works and sail-cloth manufactories. The barony of Widnes in 1554–55 was declared to be part of the duchy of Lancaster. The town was incorporated in 1892.

WIDOWS' PENSIONS: *see* NATIONAL INSURANCE, WIDOWS' AND ORPHANS' PENSIONS.

WIDUKIND or **WITTEKIND** (d. *c.* 807), leader of the Saxons, belonged to a noble Westphalian family. He probably fought the Franks before and during 776. In 778 he returned from exile in Denmark to lead a fresh rising, and in 782 the Saxons at his instigation drove out the Frankish priests, and plundered the border territories. His movements in 783–84 are uncertain; but in 785 he was reconciled to Charlemagne at Attigny and baptized, the king acting as his sponsor and loading him with gifts. The details of his later life are unknown. He probably returned to Saxony. Many legends have gathered around his memory. He is reported to have been duke of Engria, to have been a devoted Christian, and to have fallen in battle in 807. Royal houses have sought to establish descent from him, but except in the case of Matilda, wife of the German king, Henry I. the Fowler, without success.

See W. Diekamp, *Widukind der Sachsenführer nach Geschichte und Sage* (Münster, 1877); J. Dettmer, *Der Sachsenführer Widukind nach Geschichte und Sage* (Würzburg, 1879).

WIDUKIND, Saxon historian, was the author of *Res gestae Saxonicae.* He was a monk at the Benedictine abbey of Corvey, and he died about 1004. His *Res gestae Saxonicae,* dedicated to Matilda, abbess of Quedlinburg, who was a daughter of Otto the Great, is divided into three books, and the greater part of it was undoubtedly written during the lifetime of the emperor, probably about 968. Starting with the origin of the Saxons, the history comes down to the death of Otto in 997. Many quotations from the Vulgate are found in his writings, and there are traces of a knowledge of Virgil, Ovid and other Roman poets. The earlier part of his work is taken from tradition, but he wrote on contemporary events as one familiar with court life and the events of the day.

The best edition of the *Res gestae* is that edited by G. Waitz in the *Monumenta Germaniae historica. Scriptores,* Band iii. (Hanover and Berlin, 1826). A good edition published at Hanover and Leipzig in 1904 contains an introduction by K. A. Kehr.

See R. Köpke, *Widukind von Corvey* (Berlin, 1867); J. Raase, *Widukind von Korvei* (Rostock, 1880); and B. Simson, "Zur Kritik des Widukind" in the *Neues Archiv der Gesellschaft für ältere deutsche Geschichte,* Band xii. (Hanover, 1876).

WIELAND, CHRISTOPH MARTIN (1733–1813), German poet and man of letters, was born at Oberholzheim, a village near Biberach in Württemberg, on Sept. 5, 1733. His father, who was pastor in Oberholzheim, and subsequently in Biberach, took great pains with the child's education, and sent him to the gymnasium at Klosterberge, near Magdeburg. Under the influence of a first love-affair, with Sophie Gutermann, he planned his first ambitious work, *Die Natur der Dinge* (1752), a didactic poem in six books. In 1750 he went to Tübingen to study law, but his time was mainly taken up with literary studies. The poems he wrote at the university—*Hermann,* an epic (published by F. Muncker, 1886), *Zwölf moralische Briefe in Versen* (1752), *Anti-Ovid* (1752)—are pietistic in tone and dominated by the influence of Klopstock. They attracted the attention of J. J. Bodmer, who invited Wieland to visit him in Zürich in the summer of 1752. After a few months, however, Bodmer felt himself as little in sympathy with Wieland as, two years earlier, he had felt himself with Klopstock, and the friends parted; but Wieland remained in Switzerland until 1760, residing, in the last year, at Berne where he obtained a position as private tutor. Here he stood in intimate relations with Rousseau's friend Julie de Bondeli. Meanwhile a change had come over Wieland's tastes; the writings of his early Swiss years—*Der geprüfte Abraham* (1753), *Sympathien* (1756), *Empfindungen eines Christen* (1757)—were still in the manner of his earlier writings, but with the tragedies, *Lady Johanna Gray* (1758), and *Clementina von Porretta* (1760)—the latter based on Richardson's *Sir Charles Grandison*—the epic fragment *Cyrus* (1759), and the "moral story in dialogues," *Araspes und Panthea* (1760), Wieland, as Lessing said, "forsook the ethereal spheres to wander again among the sons of men."

Wieland's conversion was completed at Biberach, whither he had returned in 1760, as director of the chancery. He had access to the library at Warthausen of Count Stadion. Here he met once more Sophie Gutermann, who had meanwhile become the wife of Hofrat Laroche, then manager of Count Stadion's estates. The former poet of an austere pietism now became the advocate of a light-hearted philosophy, from which frivolity and sensuality were not excluded. In *Don Sylvio von Rosalva* (1764), a romance in imitation of *Don Quixote,* he held up to ridicule his earlier faith and in the *Komische Erzählungen* (1765) he gave his extravagant imagination only too free a rein. More important is the novel *Geschichte des Agathon* (1766–1767), in which, under the guise of a Greek fiction, Wieland described his own spiritual and intellectual growth. This work, which Lessing recommended as "a novel of classic taste," is a landmark in the development of the modern psychological novel. Of equal importance was Wieland's translation of twenty-two of Shakespeare's plays into prose (8 vols., 1762–1766); it was the first attempt to present the English poet to the German people in something approaching entirety. With the poems *Musarion oder die Philosophie der Grazien* (1768), *Idris* (1768), *Combabus* (1770), *Der neue Amadis* (1771), Wieland opened the series of light and graceful romances in verse which acted as an antidote to the sentimental excesses of the subsequent *Sturm und Drang* movement.

Wieland married in 1765, and between 1769 and 1772 was professor of philosophy at Erfurt. In the last-mentioned year he published *Der goldene Spiegel oder die Könige von Scheschian,* a pedagogic work in the form of oriental stories; this attracted the attention of duchess Anna Amalie of Saxe-Weimar, who appointed him tutor to her two sons, Karl August and Konstantin, at Weimar. With the exception of some years spent at Ossmannstedt, where in later life he bought an estate, Weimar remained Wieland's home until his death on Jan. 20, 1813. Here, in 1773, he founded *Der Deutsche Merkur,* which under his editorship (1773–1789) became the most influential literary review in Germany. Of the writings of his later years the most important are the admirable satire on German provinciality—the most attractive of all his prose writings—*Die Abderiten, eine sehr wahrscheinliche Geschichte* (1774), and the charming poetic romances, *Das Wintermärchen* (1776), *Das Sommermärchen* (1777), *Geron der Adelige* (1777), *Die Wünsche oder Pervonte* (1778), a series culminating with Wieland's poetic masterpiece, the romantic epic of *Oberon* (1780). His later work included novels, translations of Horace, Lucian and Cicero, and the editing of the *Attisches Museum* (1796–1803).

Without creating a school in the strict sense of the term, Wieland influenced very considerably the German literature of his time. Modern editions of Wieland's *Sämtliche Werke* are those of H. Düntzer (4 vols., 1879–82), and the critical edition issued by the Prussian Academy (1909, etc.).

There are numerous editions of selected works, notably W. Bölsche (4 vols., 1902). Collections of Wieland's letters were edited by his son Ludwig (1815) and by H. Gessner (1815–16); his letters to Sophie La Roche by F. Horn (1820). *See* J. G. Gruber, *C. M. Wielands Leben* (4 vols., 1827–28); H. Döring, *C. M. Wieland* (1853); J. W. Loebell, *C. M. Wieland* (1858); H. Pröhle, *Lessing, Wieland, Heinse* (1876); L. F. Ofterdinger, *Wielands Leben und Wirken in Schwaben und in der Schweiz* (1877); R. Kiel, *Wieland und Reinhold* (1885); F. Thalmeyr, *Über Wielands Klassizität, Sprache und Stil* (1894); M. Döll, *Wieland und die Antike* (1896); C. A. Behmer, *Sterne und Wieland* (1899); W. Lenz, *Wielands Verhältnis zu Spenser, Pope und Swift* (1903); L. Hirzel, *Wielands Beziehungen zu den deutschen Romantikern* (1904). *See* also M. Koch's article in the *Allgemeine deutsche Biographie* (1897). (J. G. R.)

WIELICZKA, a mining town in Poland, 220 m. by rail W. of Lemberg and 9 m. S.E. of Cracow. It is built on the slopes of a hill which half encircles the place, and over the celebrated salt-mines of the same name. These mines are the richest in Poland, and among the most remarkable in the world. They consist of seven different levels, one above the other, and have eleven shafts, two of which are in the town. The levels are connected by flights of steps, and are composed of a labyrinth of chambers and passages, whose length aggregates over 65 m. The length of the mines from E. to W. is 2½ m., the breadth from N. to S. is 1,050 yd. and the depth reaches 980 ft. Many of the old chambers, some of which are of enormous size, are embellished with portals, candelabra, statues, etc., all hewn in rock-salt. There are also two large chapels, containing altars, ornaments, etc., in rock-salt, a room called the dancing saloon, where the objects of interest found in the mines are kept. In the interior of the mines are sixteen ponds, of which Przykos is 195 ft. long, 110 ft. broad, and 10–26 ft. deep. The mines employ over 1,000 workers, and yield about 60,000 tons annually. The salt of Wieliczka is well known for its purity and solidity, but has generally a grey or blackish colour. The date of the discovery of the mines is unknown, but they were already worked in the 11th century. The mines suffered greatly from inundations in 1868 and 1879, and the soil on which the town is built shows signs of subsidence.

WIEN, WILHELM (1864–1928), German physicist, was born on Jan. 13, 1864, at Gaffken (East Prussia). He studied at the universities of Göttingen, Heidelberg and Berlin, and in 1890 entered the Physico-Technical Institute as assistant to Helmholtz. In 1896 he was appointed professor at the technical high school, Aix-la-Chapelle; in 1899 he went to Giessen, in 1900 to Würzburg, and in 1920 to Munich. Wien's researches covered almost the whole sphere of physics. He wrote on optical problems; on radiation, especially black-body radiation, for which in 1911 he was awarded the Nobel prize; on water and air currents, on discharge through rarefied gases, cathode rays, X-rays and positive rays. Wien's most important contributions to black-body radiation are contained in the two laws named after him. He developed a formula for the energy density associated with a definite wave length at a certain temperature, and from this obtained what is known as Wien's displacement law, which states that the product of the wave length at which the energy density is a maximum and the absolute temperature is a constant. Wien also developed a formula for the energy distribution of black-body radiation; this was found to hold for short wave lengths only but is important as a link in the chain which led to Planck's formula. His work on positive rays is of great importance; he showed that these rays underwent electrostatic and magnetic deflection as early as 1898 and continued his researches on this subject. In 1913 he lectured at Columbia University in New York on problems of modern theoretical physics. He died on Aug. 30, 1928.

Wien was the editor of the *Annalen der Physik* from vol. 21 (1906). His chief works are: *Lehrbuch der Hydrodynamik* (1900); *Neuere Probleme der theoretischen Physik* (1913); *Die Relativitäts-theorie vom Standpunkte der Physik und Erkenntnislehre* (1921).

WIENER-NEUSTADT, a town in Lower Austria, in a moderately fertile basin at the point of divergence of routes from Vienna to the Semmering pass and to Hungary via the Sopron gate. The town was founded in 1192 and its critical situation is reflected in the various struggles for its control between Austria and Hungary (1246 and 1486), and Austria and Turkey (1529 and 1683). It is essentially modern in appearance, owing to rebuilding in 1834, following almost complete destruction by fire. But there remains a 12th century castle built by Duke Leopold V., converted by Maria Theresa in 1752 into a military academy and, since 1919, a school for boys; the 13th century Romanesque Liebfrauen church, with Gothic choir and transepts added in the 15th century; and the 15th century Cistercian abbey with its rich library and museum. Helped by its situation Wiener-Neustadt has become an industrial town with special interests in locomotives and railway stock, machinery, textiles and leather goods, to which may be added sugar-refining, paper-making and the manufacture of pottery. A flourishing trade is facilitated by a canal to the capital, chiefly used for the transport of coal and timber. Pop. (1923), 36,956.

WIESBADEN, a town and watering-place in the Prussian province of Hesse-Nassau. Pop. (1925) 102,476. Wiesbaden is one of the oldest watering-places in Germany. The springs mentioned by Pliny as *Fontes Matthiaci* were known to the Romans, who fortified the place *c.* 11 B.C. The wall known as the *Heidenmauer,* was probably part of the fortifications built under Diocletian. The name *Wisibada* ("meadow bath") appears in 830. Under the Carolingian monarchs it was the site of a palace, and Otto I. gave it civic rights. In the 11th century the town and district passed to the counts of Nassau, and in 1355 Wiesbaden became with Idstein capital of the county Nassau-Idstein. It suffered from the ravages of the Thirty Years' War and was destroyed in 1644. In 1744 it became the seat of government of the principality Nassau-Usingen, and was from 1815 to 1866 the capital of the duchy of Nassau, when it passed with that duchy to Prussia. It is situated under the south-western spurs of the Taunus range, 5 m. N. of Mainz, 3 m. from the Rhine (at Biebrich), and 25 m. W. of Frankfurt-on-Main by rail. Its prosperity is mainly due to its hot alkaline springs and mild climate, which have rendered it a winter as well as summer resort. There is a large trade in wine and small manufactures of surgical instruments, artificial manures, furniture, cement and chocolate.

WIESER, FRIEDRICH VON (1851–1926), German political economist, professor of political economy at the Vienna University, was the author of *Das Hauptgesetz des Wirtschaftlichen Staates* (1884), *Die Theorie der gesellschaftlichen Wirtschaft* (1914), and *Das Gesetz der Macht,* published posthumously. He died at St. Gilgen in the Salzkammergut, on July 24, 1926.

WIG, short form for "periwig." An artificial head of hair, worn as a personal adornment, disguise or symbol of office. The wearing of wigs is of great antiquity, and Egyptian mummies have been found so adorned. In Greece wigs were used by men and women. A reference in Xenophon to the false hair worn by Cyrus's grandfather "as is customary among the Medes," and also a story in Aristotle, would suggest that wigs were introduced from Persia, and were in use in Asia Minor. The elaborately frizzled hair worn by some of the figures in the frescoes found at Knossos makes it probable that the wearing of artificial hair was known to the Cretans. Lucian, in the 2nd century, mentions wigs of both men and women as a matter of course. The theatrical wig was also in use in Greece, the various comic and tragic masks having hair suited to the character represented. A. E. Haigh (*Attic Theatre,* pp. 221, 239) refers to the black hair and beard of the tyrant, the fair curls of the youthful hero, and the red hair characteristic of the dishonest slave of comedy. These conventions appear to have been handed on to the Roman theatre.

At Rome wigs came into use certainly in the early days of the empire. They were also known to the Carthaginians; Polybius says that Hannibal used wigs as a means of disguise. The fashionable ladies of Rome were much addicted to false hair, and we learn from Ovid and Martial that the golden hair imported from

Germany was most favoured. Juvenal shows us Messalina assuming a yellow wig for her visits to places of ill-fame. The chief names for wigs were *galerus, galericulum, corymbium, capillamentum, caliendrum,* etc. *Galerus* meant in the first place a skull-cap, or coif, fastening under the chin, and made of hide or fur, worn by peasants, athletes and *flamines*. The first men's wigs then would have been tight fur caps simulating hair, which would naturally suggest wigs of false hair. Women continued to have wigs of different colours as part of their ordinary wardrobe, and Faustina, wife of Marcus Aurelius, is said to have had several hundred. An amusing development of this is occasionally found in portrait busts, *e.g.* that of Plautilla in the Louvre, Paris, in which the hair is made removable, so that by changing the wig of the statue from time to time it should never be out of fashion.

The periwig of the 16th century merely simulated real hair, either as an adornment or to supply the defects of nature. It was not till the 17th century that the peruke was worn as a distinctive feature of costume. The fashion started in France. In 1620 the abbé La Rivière appeared at the court of Louis XIII. in a periwig made to simulate long fair hair, and four years later the king himself, prematurely bald, also adopted one and thus set the fashion. Louis XIV., who was proud of his abundant hair, did not wear a wig till after 1670. From Versailles the fashion spread through Europe. In England, under Charles II., the wearing of the peruke became general. Pepys records that he parted with his own hair and "paid £3 for a periwigg," and on going to church in one he says "it did not prove so strange as I was afraid it would." It was under Queen Anne, however, that the wig attained its maximum development, covering the back and shoulders and floating down over the chest.

This differentiation of wigs according to class and profession explains why, when early in the reign of George III. the general fashion of wearing wigs began to wane and die out, the practice held its own among professional men. It was by slow degrees that doctors, soldiers and clergymen gave up the custom. In the Church it survived longest among the bishops. At the coronation of Queen Victoria the archbishop of Canterbury, alone of the prelates, still wore a wig. Wigs are now worn as part of official costume only in Great Britain, their use being confined, except in the case of the speaker of the house of commons and the clerks of parliament, to the lord chancellor, the judges and barristers.

See F. W. Fairholt, *Costume in England,* 2 vols., ed. Dillon (1885); C. F. Nicolai, *Uber den Gebrauch der falschen Haare und Perrücken* (1801); the articles "Coma" and "Galerus" in Daremberg and Saglio's *Dictionnaire des antiquités. See* also Diderot's *Encyclopédie* (1765), vol. xii., *s.v.* "Perruque," and James Stewart, *Plocacosmos, or the Whole Art of Hairdressing* (1782).

WIGAN, market town; municipal, county and parliamentary borough of Lancashire, England, 194 m. N.W. by N. from London by the L.M.S. railway. It is also served by the L.N.E. railway. Pop. (1921) 89,421. It is probable that the town covers the site of a Roman post or fort, Coccium. Wigan, otherwise Wygan and Wigham, is not mentioned in Domesday Book, but three townships, Upholland, Dalton and Orrel are named. After the Conquest Wigan was part of the barony of Newton, and the church was endowed with a carucate of land, the origin of the manor. Before Henry III.'s reign the baron of Newton granted to the rector of Wigan the manorial privileges. In 1246 Henry III. granted a charter to John Mansel, parson of the church, by which Wigan was constituted a free borough and the burgesses permitted to have a gild merchant. In 1680 Ogilby observes that the town was "noted for its iron works." Pottery, pewter and bell-founding were important trades. Manufacture of woollens, especially of blankets, was carried on in the 18th century. The cotton trade developed rapidly after the introduction of the cylindrical carding machine. During the Civil War the town, from its vicinity to Lathom House and the influence of Lord Derby, adhered staunchly to the king. On April 1, 1643 the Parliamentarians captured Wigan (*see* Lancashire). The following month Lord Derby regained it for the Royalists, but Colonel Ashton soon retook it. In 1651 Lord Derby landed from the Isle of Man and marched through Preston to Wigan and at Wigan Lane, on Aug. 25, the Royalist forces were defeated and Lord Derby wounded. During the rebellion of 1745 Prince Charles Edward spent one night (Dec. 10) here. In 1295 Wigan returned two members to parliament and again in 1307; the right then remained in abeyance till 1547, but from that time till 1885, except during the Commonwealth, the borough returned two members, and since 1885 one member. The list of rectors is complete from 1199; the list of mayors goes back to 1370, town clerks to 1350, and recorders to 1600.

Wigan lies on the small river Douglas, which flows into the estuary of the Ribble. There is connection by canal with Liverpool, Manchester, etc. The town has coal mines which are famous for cannel coal, and which employ a large proportion of the inhabitants and supply the factory furnaces. The chief manufactures are cotton fabrics and linen fabrics; the town also possesses iron forges, iron and brass foundries, oil, grease and chemical works, railway waggon factories, and bolt, screw and nail works. The borough includes the important district of Pemberton.

WIGGIN, KATE DOUGLAS (1856–1923), American novelist, daughter of Robert N. Smith, a lawyer, was born in Philadelphia (Pa.), Sept. 28, 1856, whence her family removed to Hollis (Maine). She was educated at home and at various seminaries including Abbot academy, Andover (Mass.), and when 17 years of age joined her family in California. Having been a member of Miss Marwedel's pioneer training class, she was called from her teaching in Santa Barbara to establish in San Francisco the first free kindergarten on the western coast (1878), and organized her own California kindergarten training school in 1880. She married, in 1881, Samuel B. Wiggin, who died in 1889. In 1895 she married George C. Riggs, but continued to write under the name of Wiggin. She died in England, Aug 24, 1923. Her interest in children's education was shown in numerous books, but her literary reputation rests rather on her prose fiction: *The Birds' Christmas Carol* (1888), the Penelope series (5 vols.); *Rebecca of Sunnybrook Farm* (1903); *New Chronicles of Rebecca* (1907); and *The Story of Waitstill Baxter* (1913). Several of these were dramatized with the assistance of collaborators. An autobiographical volume is *My Garden of Memory* (1923).

A uniform "Quillcote" edition of her books appeared in ten vols. Several of them have been translated into many languages. *See* also Nora Archibald Smith, *Kate Douglas Wiggin as Her Sister Knew Her* (1925).

WIGGLESWORTH, MICHAEL (1631–1705), American clergyman, physician and poet, was born in England (probably in Yorkshire) Oct. 18, 1631. His father, persecuted for his Puritan faith, emigrated with his family to New England in 1638 and settled in New Haven. In 1651 Michael graduated at Harvard, where he was a tutor (and a Fellow) in 1652–54 and again in 1697–1705. Having fitted himself for the ministry, he preached at Charlestown in 1653–54, and in spite of ill health, was pastor at Malden from 1656 until his death, June 10, 1705. Wigglesworth is best known as the author of *The Day of Doom; or a Poetical Description of the Great and Last Judgment* (1662), a lurid exposition of Calvinistic theology, which children were made to learn like the catechism.

WIGHT, ISLE OF, off the south coast of England, part of Hampshire, separated from the mainland of Hampshire by the Solent and Spithead. It is 22½ m. from east to west and 13½ m. from north to south. The area is 147 sq.m. The south coast is chiefly cliff-bound and there is beautiful scenery both inland and along the northern shores. The climate is mild and healthy. As a result there are numerous watering places. Chalk downs range from east to west, terminating in the Culver cliffs and the Needles. These downs are from 400 to 700 ft. high. North of this ridge the chalk dips beneath Tertiary rocks with heavy soils, which support extensive areas of trees.

Three rivers, the eastern Yar, Medina and western Yar, drain the island. The Medina bisects the island. The structure of the island is that of a simple monocline, the central chalk ridge forming an almost vertical limb. To the south of this, the dip of the beds is southward at a very low angle and there is a second range of downs, in the extreme south, between St. Catherine's Point and Dunnose, which exceed 800 ft. in St. Catherine's Hill. Below these heights on the seaward side occurs the remarkable tract known as the Undercliff, a terrace formed by the sliding of the

Chalk and Upper Greensand upon the unctuous surface of the Gault clay. The upper cliffs shelter this terrace and the climate is remarkably mild. This part of the island affords a winter resort. Along the south coast the action of small streams on the soft rocks has hollowed out steep gullies. Many of these are of great beauty; the most famous are Shanklin and Blackgang chines. The western peninsula shows the finest development of sea-cliffs. Off the westernmost promontory rise three detached masses of chalk about 100 ft. high known as the Needles, exposed to the full strength of the south-westerly gales. During a storm in 1764 a fourth spire was undermined and fell.

Newport at the head of the Medina estuary is the chief town; Cowes at the mouth, the chief port. The principal resorts are Cowes (headquarters of the Royal Yacht Squadron) Ryde, Sandown, Shanklin, Ventnor, Freshwater Gate and Yarmouth. Others are Totland Bay, Gurnard (Cowes), Seaview and Bembridge (Ryde). The principal communications with the mainland are between Cowes and Southampton, Ryde and Portsmouth, and Yarmouth and Lymington. The island is well supplied with railways and roads. The island shares in the defences of the Solent, and the entry to Portsmouth; there are batteries at Puckpool, on the eastern foreland, and the west coast. Osborne House, near Cowes, a residence and scene of the death of Queen Victoria, was presented to the nation by King Edward VII. in 1902.

The island is divided into two liberties, East and West Medina, excluding the boroughs of Newport and Ryde; and contains the urban districts of Cowes, East Cowes, St. Helens, Sandown, Shanklin and Ventnor. The island has for many centuries belonged to the see of Winchester.

History.—Relics of the Roman occupation following the conquest by Vespasian in A.D. 43, are the villas at Brading and Carisbrook, the cemetery at Newport, and remains of foundations at Combly Farm, Gurnet, and between Brixton and Calbourne. The Jutes probably settled here and in 661 it was annexed by Wulfhere to Wessex and subsequently bestowed on the king of Sussex. In 998 it was the headquarters of the Danes.

From the 14th to the 16th century the island was under fear of invasion by the French, who in 1377 burnt Yarmouth and Francheville (the latter being subsequently rebuilt and known as Newtown), and so devastated Newport that it lay uninhabited for two years. In 1419, a French force landed and demanded tribute in the name of King Richard and Queen Isabella, which was refused, and the French returned home. Another raid was attempted in 1545 when a French fleet of 225 ships drew up off Brading Harbour and wrought much destruction. As a result an organised system of defence was planned. Forts were constructed at Cowes, Sandown, Freshwater and Yarmouth. Charles I. was imprisoned in Carisbrook Castle in 1647–48 and, in 1650, his two children, the princess Elizabeth and the Duke of Gloucester, the former dying there.

The lordship of the island was granted by William the Conqueror to William Fitz-Osbern, but escheated to the crown. It was bestowed by Henry I. on Baldwin de Redvers, whose descendant Isabella de Fortibus sold it to Edward I. in 1293.

In the Domesday Survey 29 mills are mentioned, and saltworks at Boarhunt, Bowcombe, Watchingwell and Whitfield. The island quarries have been worked from remote times, that of Quarr supplying material for Winchester cathedral. Alum and sand for glass-making were formerly obtained at Alum Bay.

One member is returned to parliament for the whole island. Antiquities include British pit villages (Rowborough), prehistoric tumuli on several of the chalk downs, the so-called Long Stone at Mottiston, a lofty sandstone monolith, well-preserved examples of tesselated Roman pavements near Brading, Carisbrooke Castle, a beautiful ruin built upon the site of an ancient British stronghold, and remains of Quarr Abbey near Ryde. The most noteworthy ancient churches are those of Bonchurch (Norman), Brading (transitional Norman and Early English), Shalfleet (Norman and Decorated), and Carisbrooke, of various styles.

BIBLIOGRAPHY.—E. C. Hargrove, *England's Garden Island* (1925); H. J. Osborne White, *The Geology of the Isle of Wight* (Survey Memoir, 1921).

WIGTOWNSHIRE (sometimes called WEST GALLOWAY), south-western county, Scotland, bounded north by Ayrshire, east by Kirkcudbrightshire and Wigtown bay, south by the Irish sea and west and north by the North channel. Including the island of St. Helena, at the head of Luce bay, it covers 311,984 acres (excluding water). On the eastern boundary the estuary of the Cree expands into Wigtown bay, between which and Luce bay extends the promontory of the Machers, terminating in Burrow head. By the indentation of Luce bay on the south and Loch Ryan on the north the hammerheaded peninsula of the Rinns is formed, of which the Mull of Galloway, the most southerly point of Scotland, is the southern, and Milleur point the northern extremity. The coast has many inlets, but most are exposed and beset with rocks. Loch Ryan is a natural harbour of which Stranraer is the port.

A line north-east from the coast about 3 m. south of Portpatrick divides the county so that practically all the rocks on the northern side are of Ordovician age, while those on the south are Silurian. This line coincides with the general direction of the strike of the beds throughout the county. Glacial moraines and drumlins are widespread and are well seen between Glenluce and Newton Stewart and south of Wigtown. On the coasts of Luce bay and Loch Ryan raised beaches are found at levels of 25 ft. and 50 ft. above the sea. Towards the Ayrshire border, hills reach 1,000 ft. in height. The chief rivers are the Cree, forming the boundary with Kirkcudbrightshire, and the Bladenoch, issuing from Loch Maberry and falling into Wigtown Bay at Wigtown after a course of 22 m. Most of the numerous lochs are small.

History and Antiquities.—The history of Wigtownshire is hardly distinguishable from that of Galloway (*q.v.*). Evidences of the Pictish occupation are prevalent in the form of hill forts, cairns, standing stones, hut circles and crannogs or lake dwellings. There are so few Roman remains that it has been concluded they effected no permanent settlement in West Galloway. Ninian, the first Christian missionary to Scotland, landed at Isle of Whithorn in 396 to convert the natives. His efforts were temporarily successful. A monastery was built at Whithorn, and, though the bishopric founded in the 8th century was shortly afterwards removed, it was established again in the 12th, when the priory erected by Fergus, "king" of Galloway, became the cathedral church of the see of Galloway.

Malcolm MacHeth, who had married a sister of Somerled, lord of the Isles, headed about 1150 a Celtic revolt against the intrusion of Anglo-Norman lords, but was routed at Causewayend near the estuary of the Cree. In the disorder of the realm during David II.'s reign east Galloway had been surrendered to Edward III. (1333), but Wigtownshire, which had been constituted a shire in the previous century and afterwards called the Shire to distinguish it from the Stewartry of Kirkcudbright, remained Scottish territory. In 1372 the then earl of Wigtown sold his title and estates to the 3rd earl of Douglas, and under that family in 1426, the region came under the general law. Soon after the fall of the Douglases (1455) the Kennedy family, long established in the Ayrshire district of Carrick, obtained a preponderating influence in Wigtownshire, and in 1509 David Kennedy was created earl of Cassillis. Gilbert, the 4th earl held the shire for Mary, queen of Scots, when she broke with the Lords of the Congregation, but could do little for her cause. He profited by the Reformation himself, however, to acquire by fraud and murder the estate of Glenluce abbey (about 1570).

Among ancient castles are the cliff towers, possibly of Norse origin, of Carghidown and Castle Feather near Burrow Head; the ruins of Baldoon, south of Wigtown, associated with events which suggested to Sir Walter Scott the romance of *The Bride of Lammermoor;* Corsewall near the northern extremity of the Rinns; the Norse stronghold of Cruggleton, south of Garliestown; Dunskey, south of Portpatrick, built in the 16th century, occupying the site of an older fortress; the fragments of Long castle at Dowalton loch, the ancient seat of the MacDonells; Myrton, the seat of the MacCullochs, in Mochrum parish; and the ruined tower of Sorbie, the ancient keep of the Hannays.

Agriculture and Industries.—Much of the shire consists of

stony moors, rendering the work of reclamation difficult. The gravelly soil along the coast requires heavy manuring, and in the higher arable quarters a rocky soil prevails, better adapted for grass and green crops than for grain. Much of the surface is black top reclaimed from the moors, and in some districts loam and clay are found. Half of the shire is, however, under cultivation, and the standard of farming is as high as that of any county in Scotland. Ayrshire cattle are the favourite breed for dairying, with black polled Galloways in the eastern districts. The sheep are principally black-faced on the hill farms, and in other parts Leicester and other long-woolled breeds, wool being an important product. Great numbers of pigs are kept. The shire has acquired some reputation for its horses, chiefly Clydesdale. There is regular communication by mail steamer between Stranraer and Larne in Co. Antrim, Ireland.

Population and Administration.—In 1921 the population was 30,783; 103 persons spoke Gaelic and English. The principal towns are Stranraer (pop. 6,138); Newton Stewart (1,831), which, however, extends into Kirkcudbrightshire; Wigtown (1,299); and Whithorn (1,033). The county returns one member to parliament. Wigtown, the county town, Stranraer and Whithorn are royal burghs. The shire forms a sheriffdom with Dumfries, and a sheriff-substitute sits at Wigtown and Stranraer.

WIGWAM, a term loosely adopted as a general name for the houses of North American Indians. It is, however, strictly applied to a particular dome-shaped or conical hut made of poles lashed together at the tops and covered with bark. The skin tents of many of the Plains Indians are called *tepees*. The word "wigwam" represents the Europeanized or Anglicized form of the Algonkian *wēkou-om-ut, i.e.*, "in his (their) house."

WIHTRED, king of Kent (d. 725), son of Ecgberht, nephew of Hlothhere and brother of Eadric, came to the Kentish throne in 690 after the period of anarchy which followed the death of the latter king. Bede states that Wihtred and Swefheard were both kings in Kent in 692, and this statement would appear to imply a period of East Saxon influence (*see* KENT), while there is also evidence of an attack by Wessex. Wihtred, however, seems to have become sole king in 694. At his death in 725, he left the kingdom to his sons Aethelberht, Eadberht and Alric. There is still extant a code of laws issued by him in a council held at a place called Berghamstyde (Barham?) during the fifth year of his reign (probably 695).

See Bede, *Hist. Eccl.* ed. C. Plummer (Oxford, 1896); *Anglo-Saxon Chronicle,* ed. Earle and Plummer (Oxford, 1899).

WILAMOWITZ-MÖLLENDORFF, ULRICH VON (1848–), German scholar, was born on Dec. 22, 1848 at Markowitz in Posen. He studied at Bonn and Berlin, and afterwards travelled in Italy and Greece (1872–74). In the latter year he took a post as lecturer in Berlin, and afterwards became a professor in Greifswald and Göttingen. In 1897 he was appointed professor of ancient philology in the University of Berlin. Wilamowitz proved himself not only an excellent editor and witty commentator on the Greek tragedies of Aeschylus, Euripides and Aristotle, but also a brilliant translator of Greek verse. Sharply attacked by Friedrich Nietzsche in his youth, Wilamowitz became one of the first authorities of modern times in the field of Greek philology.

Among his numerous works are: *Aeschyli Tragoediae* (Greek and German 1914); *Euripides' Herakles,* with an introduction to the Greek tragedy and German annotations (1889); *Die Textgeschichte der griechischen Lyriker* (1900); *Bucolici Graeci* (Oxford, 1905); *Die Ilias und Homer* (1916); *Platon,* (1919); *Hellenistische Dichtung* (1924); *Griechische Verskunst* (1921); *Pindaros* (1922); *Die Heimkehr des Odysseus* (1927).

WILBERFORCE, SAMUEL (1805–1873), English bishop, third son of William Wilberforce, was born at Clapham Common, London, on Sept. 7, 1805. He graduated from Oriel College, Oxford, in 1826, taking a first class in mathematics and a second in classics. He was ordained in 1828, and in 1830 became rector of Brightstone, Isle of Wight. Although a High Churchman Wilberforce held aloof from the Oxford movement, and in 1838 his divergence from the "Tract" writers became so marked that J. H. Newman declined further contributions from him to the *British Critic,* not deeming it advisable that they should longer "cooperate very closely." In 1838 Wilberforce published, with his elder brother Robert, the *Life* of his father, and two years later his father's *Correspondence.* In 1839 he also published *Eucharistica* (from the old English divines), to which he wrote an introduction, *Agathos and other Sunday Stories,* and a volume of *University Sermons,* and in the following year *Rocky Island and other Parables.* In March 1844 he was made dean of Westminster, and in October bishop of Oxford.

The bishop in 1847 became involved in the Hampden controversy, and signed the remonstrance of the thirteen bishops to Lord John Russell against R. D. Hampden's appointment to the bishopric of Hereford. He also endeavoured to obtain satisfactory assurances from Hampden; but, though unsuccessful in this, he withdrew from the suit against him. The publication of a papal bull in 1850 establishing a Roman hierarchy in England brought the High Church party, of whom Wilberforce was the most prominent member, into temporary disrepute. His diary reveals a devout private life which has been overlooked by those who have only considered the versatile facility and persuasive expediency that marked the successful public career of the bishop, and earned him the sobriquet of "Soapy Sam."

His attitude towards *Essays and Reviews,* 1861, against which he wrote an article in the *Quarterly,* won him the special gratitude of the Low Church party, and latterly he enjoyed the full confidence and esteem of all except the extreme men of either side and party. On the publication of J. W. Colenso's *Commentary on the Romans* in 1861, Wilberforce sought a private conference with the author; but after the publication of the first two parts of the *Pentateuch Critically Examined* he drew up the address of the bishops which called on Colenso to resign his bishopric. Though opposed to the disestablishment of the Irish Church, yet, when the constituencies decided for it, he advised that no opposition should be made to it by the House of Lords. After twenty-four years' labour in the diocese of Oxford, he was translated by Gladstone to the bishopric of Winchester. He was killed on July 19, 1873, by the shock of a fall from his horse near Dorking, Surrey.

See *Life of Samuel Wilberforce, with Selections from his Diary and Correspondence* (1879–82), vol. i., ed. by Canon A. R. Ashwell, and vols. ii. and iii., ed. by his son R. G. Wilberforce, who also wrote a one-volume Life (1905). One of the volumes of the "English Leaders of Religion" is devoted to him, and he is included in Dean Burgon's *Lives of Twelve Good Men* (1888).

WILBERFORCE, WILLIAM (1759–1833), English philanthropist whose name is chiefly associated with the abolition of the slave trade, was descended from a Yorkshire family which possessed the manor of Wilberfoss in the East Riding from the time of Henry II. till the middle of the 18th century. He was the only son of Robert Wilberforce, member of a commercial house at Hull, by his wife Elizabeth, daughter of Thomas Bird of Barton, Oxon, and was born at Hull on Aug. 24, 1759. At the age of 9 he lost his father and was transferred to the care of a paternal uncle at Wimbledon; but in his 12th year he returned to Hull, and was placed under the care of the master of the endowed school of Pocklington. Here he neglected his studies, but he entered St. John's college, Cambridge, in Oct. 1766. Left by the death of his grandfather and uncle the possessor of an independent fortune under his mother's sole guardianship, he was somewhat idle at the university, though he acquitted himself in the examinations with credit; but in his serious years he "could not look back without unfeigned remorse" on the opportunities he had then neglected. In 1780 he was elected M.P. for Hull. He soon found his way into the fast political society of London, and at the club at Goosetrees renewed an acquaintance begun at Cambridge with Pitt, which ripened into a close friendship. In the autumn of 1783 he set out with Pitt on a tour in France; and after his return his eloquence proved of great assistance to Pitt in his struggle against the majority of the House of Commons. In 1784 Wilberforce was elected for both Hull and Yorkshire, and took his seat for the latter constituency.

A journey to Nice in the autumn of the same year with Dr. Isaac Milner (1750–1820), who had been one of his masters at Hull grammar school, and afterwards became president of

Queens' college, Cambridge, and dean of Carlisle, led to his conversion to Evangelical Christianity. The change had a marked effect on his public conduct. In the beginning of 1787 he busied himself with the establishment of a society for the reformation of manners. About the same time he met Thomas Clarkson, and began the agitation against the slave trade. Pitt recommended Wilberforce to undertake the guidance of the project as a subject suited to his character and talents. While Clarkson conducted the agitation throughout the country, Wilberforce took every opportunity in the House of Commons of exposing the evils and horrors of the trade. For the history of the various motions introduced by Wilberforce *see* the article SLAVERY. It was not till 1807, the year following Pitt's death, that the first great step towards the abolition of slavery was accomplished. When the anti-slavery society was formed in 1823, Wilberforce and Clarkson became vice-presidents; but before their aim was accomplished Wilberforce had retired from public life, and the Emancipation Bill, which was the culmination of his life-work, was not passed till Aug. 1833, a month after his death.

In May 1797 he married Barbara Ann Spooner and took a house at Clapham, where he became one of the leaders of the "Clapham Sect" of Evangelicals, including Henry Thornton, Charles Grant, E. J. Eliot, Zachary Macaulay and James Stephen. In connection with this group he planned a religious periodical which should admit "a moderate degree of political and common intelligence," the result being the appearance in January 1801 of the *Christian Observer*. He also interested himself in a variety of schemes for the social and religious welfare of the community. In parliament he was a supporter of parliamentary reform and of Roman Catholic emancipation. In 1812, on account of failing health, he exchanged the representation of Yorkshire for that of Bramber, Sussex. In 1825 he retired from the House of Commons, and the following year settled at Highwood Hill, near Mill Hill. He died at London on July 29, 1833, and was buried in Westminster Abbey.

In 1797 Wilberforce published *A Practical View of the Prevailing Religious System of Professed Christians in the Higher and Middle Classes of this Country Contrasted with Real Christianity*, which within half a year went through five editions and was translated into French, Italian, Dutch and German.

The chief authorities of the career of William Wilberforce are his *Life* (5 vols., 1838) by his sons, Robert, Isaac and Samuel, and his *Correspondence* (1840) also published by his sons. A smaller edition of the *Life* was published by Samuel Wilberforce in 1868. *See* also *The private papers of William Wilberforce*, edited by A. M. Wilberforce (1897); Sir James Stephen, *Essays in Ecclesiastical Biography* (1849); J. C. Colquhoun, *Wilberforce, His Friends and Times* (1866); John Stoughton, *William Wilberforce* (1880); J. J. Gurney, *Familiar Sketch of Wilberforce* (1838); J. S. Hartford, *Recollections of W. Wilberforce* (1864) and R. Coupland, *Wilberforce* (Oxford, 1923).

WILBUR, RAY LYMAN (1875–), American educationist, was born at Boonesboro, Ia., on April 13, 1875. He graduated at Stanford university in 1896, proceeding thence to Cooper Medical college, San Francisco, and later continued his studies at London, Frankfurt and Munich. He began his teaching at Stanford in 1900, becoming professor of medicine in 1909 and dean of the medical school in 1911. In 1915 he was appointed president. He was chief of the division of conservation of the U.S. Food Commission, and a member of the California State Council of Defence 1917. On March 4, 1929, he became secretary of the interior in the cabinet of President Hoover.

WILBYE, JOHN (1574–1638), English madrigal composer, was born at Diss, Norfolk, in 1574, the date of his baptism being March 9. Until recently nothing was known of his life but many facts have now come to light. His father was a well-to-do landowner, Matthew Wilbye. Through his early acquaintance with the Cornwallis family at Brome Hall John became resident musician at Hengrave Hall, the seat of Sir Thomas Kytson, whose wife was Elizabeth Cornwallis. The inventories of Hengrave give the items of furniture in Wilbye's rooms and the Hengrave Letter Book II. contains a letter from Wilbye to a friend, which has been reproduced in volume VI. of *The English Madrigal School*. In 1628 Lady Kytson died, and Wilbye retired to Colchester, where he lived in the house of Lady Rivers, a daughter of the Kytsons. This house was still standing in 1927. Wilbye died there in Sept. 1638, in his sixty-fifth year.

Wilbye's madrigals are the most famous of the English school. He had in a supreme degree the quality of style and he obtained wonderful effects of contrast by his skill in grouping the voices. His *First Set of English Madrigals to 3, 4, 5, and 6 voices* was published in 1598, bearing the date April 12, and was dedicated to Sir Charles Cavendish, son-in-law of Sir Thomas Kytson. It contains 30 numbers, including the famous "Flora gave me fairest flowers." The madrigals of the *Second Set*, dedicated to Lady Arabella Stuart, which appeared in 1609, are even more finished in style. Among them are "Draw on, Sweet Night"; "Stay, Corydon"; and "Sweet honey-sucking bees."

Both sets have been reprinted by the Musical Antiquarian Society, and for the English Madrigal School (vol. vi., with biographical details) and vii. Two Latin motets are in Arkwright's *Old English Edition* (1889–1902; 1922, etc.); Leighton's *Teares or Lamentacions* (1614) contains 2 numbers by Wilbye, "I am quite tired" (a 4) and "O God the Rock" (a 5). A six-part madrigal, "The Lady Oriana," is in the "Triumph of Oriana" (1601). Most of the English collections include one or more of Wilbye's madrigals. *See* also Rev. E. H. Fellowes, *English Madrigal Composers* (1921), and the article by him in Grove's *Dictionary*, 3rd ed.

WILD, JONATHAN (*c.* 1682–1725), English criminal, was born about 1682 at Wolverhampton, where his father was a wig-maker. After a term of imprisonment he set up as a receiver of stolen goods. Wild built up an immense business, posing as a recoverer of stolen goods, the thieves receiving a commission on the price paid for recovery. A special act of parliament was passed by which receivers of stolen property were made accessories to the theft, but Wild's professed "lost property office" had little difficulty in evading the new law, and became so prosperous that two branch offices were opened. Wild went on to arrange robberies himself, and he devised and controlled a huge organization, which plundered London and its approaches wholesale. Such thieves as refused to work with him received short shrift. The notorious Jack Sheppard, wearied of Wild's exactions, at last refused to deal with him, whereupon Wild secured his arrest, and himself arrested Sheppard's confederate, "Blueskin." In return for Wild's services in tracking down such thieves as he did not himself control, the authorities for some time tolerated the offences of his numerous agents. If an arrest were made, Wild had a plentiful supply of false evidence at hand to establish his agents' *alibi*, and he obtained the conviction, by similar means, of such thieves as refused to recognize his authority. Such stolen property as could not be returned to the owners with profit was taken abroad in a sloop purchased for this work. At last he was arrested, tried at the Old Bailey, and after being acquitted on a charge of stealing lace, found guilty of taking a reward for restoring it to the owner without informing the police. He was hanged at Tyburn on May 24, 1725.

BY COURTESY OF THE IOWA GEOLOGICAL SURVEY

WILD CARROT (DAUCUS CAROTA), A COMMON WEED BEARING DENSE CLUSTERS OF WHITE FLOWERS

WILDBAD, a watering-place of Germany, in the republic of Württemberg, situated 1,475 ft. above the sea, in the gorge of the Enz in the Black forest, 28 m. W. of Stuttgart and 14 E. of Baden-Baden by rail. Pop. (1925) 5,307. Its thermal alkaline springs have a temperature of 90°–100° Fahr.

WILD CARROT (*Daucus Carota*), a biennial herb of the parsley family (Umbelliferae, *q.v.*), native to Europe, northern Africa and Asia and extensively naturalized in North America as a weed, often exceedingly pernicious in pastures, meadows and fields. It is the parent species of the common root vegetable from which it differs chiefly in the size and quality of the root. The wild carrot springs from a deep, fleshy, conical root, with an erect stem, 1 to 3 ft. high, bearing much dissected leaves and an immense number of small white flowers crowded in a large globose or flat-topped cluster (compound umbel), often 3 to 5 in. across, the central flower of each

umbel often purple. The ripening seed-vessels, which are small and bristly hairy, often form a hollow, somewhat spherical mass, open at the top, somewhat suggestive of a bird's nest. Because of this the plant is popularly called crow's-nest or bird's-nest. It is also known as Queen Anne's lace, because of the appearance of the flower clusters.

WILDE, OSCAR FINGALL O'FLAHERTIE WILLS (1856–1900), English author, son of Sir William Wilde, a famous Irish surgeon, was born in Dublin on Oct. 15, 1856; his mother, Jane Francisca Elgee, was well known in Dublin as a graceful writer of verse and prose, under the pen-name of "Speranza." Having distinguished himself in classics at Trinity college, Dublin, Oscar Wilde went to Magdalen college, Oxford, in 1874, and won the Newdigate prize in 1878 with his poem "Ravenna," besides taking a first-class in classical Moderations and in Literae Humaniores. At Oxford he adopted what to undergraduates appeared the effeminate pose of casting scorn on manly sports, wearing his hair long, decorating his rooms with peacock's feathers, lilies, sunflowers, blue china and other *objets d'art,* which he declared it his desire to "live up to," affecting a lackadaisical manner, and professing intense emotions on the subject of "art for art's sake"—then a new-fangled doctrine which J. M. Whistler was bringing into prominence. Wilde made himself the apostle of this new cult. At Oxford his behaviour procured him a ducking in the Cherwell, and a wrecking of his rooms, but the cult spread. Its affectations were burlesqued in Gilbert and Sullivan's travesty *Patience* (1881). As the leading "aesthete," Oscar Wilde became one of the most prominent personalities of the day; his affected paradoxes and his witty sayings were quoted on all sides, and in 1882 he went on a lecturing tour in the United States, where he wrote a drama, *Vera,* which was produced in New York. In 1884 he married Constance Lloyd. He had already published in 1881 a selection of his poems, which, however, only attracted admiration in a limited circle. In 1888 appeared *The Happy Prince and Other Tales,* illustrated by Walter Crane and Jacomb Hood. This charming volume of fairy tales was followed up by *Lord Arthur Savile's Crime, and Other Stories* (1891), and later by a second collection of fairy stories *The House of Pomegranates* (1892), acknowledged by the author to be "intended neither for the British child nor the British public." *The Picture of Dorian Gray* (1891) was the mirror of the new aesthete. In 1891 his tragedy in blank verse, *The Duchess of Padua,* was produced in New York. But Wilde's first real success with the larger public as a dramatist was with *Lady Windermere's Fan* (St. James's Theatre, 1892), followed by *A Woman of No Importance* (1893), *An Ideal Husband* (1895) and *The Importance of Being Earnest* (1895). The wit and brilliance of these pieces helped them to keep the stage, and they are still occasionally revived. In 1893 the licenser of plays refused a licence to Wilde's *Salome,* but it was printed in French in 1893, and produced in Paris by Sarah Bernhardt in 1894, and was translated into English in the same year by Lord Alfred Douglas.

His success as a dramatist had by this time gone some way to disabuse hostile critics of the suspicions as regards his personal character which had been excited by the apparent looseness of morals which since his Oxford days it had always pleased him to affect; but to the consternation of his friends, who had ceased to credit the existence of any real moral obliquity, in 1895 came fatal revelations as the result of his bringing a libel action against the marquis of Queensberry; and at the Old Bailey, in May, Wilde was sentenced to two years' imprisonment with hard labour for offences under the Criminal Law Amendment Act. He went bankrupt soon after. It was a melancholy end to a singularly brilliant career. After leaving prison in 1897 he lived mainly on the Continent, at Berneval and later in Paris under the name of "Sebastian Melmoth." He died in Paris on Nov. 30, 1900. In 1898 he published his powerful *Ballad of Reading Gaol.* His *Collected Poems,* containing some beautiful verse, had been issued in 1892. While in prison he wrote an apology for his life which was placed in the hands of his executor and published in 1905.

BIBLIOGRAPHY.—Oscar Wilde's works were edited in 13 vols. (1908) by Robert Ross, and two small collections of letters to Ross, *After Reading* (1921) and *After Berneval* (1922), were published. *See* also A. Gide, *Oscar Wilde* (1905); A. Ransome, *Oscar Wilde* (1912); B. Fehr, *Studien zu Oscar Wildes Gedichten* (1918); F. Harris, *Oscar Wilde, his life and confessions* (2 vols., N.Y. 1918); E. Bendz. *Oscar Wilde: a retrospect* (Vienna, 1921).

WILDERNESS, a large forest in Spottsylvania county, Virginia, U.S.A., on the south bank of the Rapidan, extending from Mine Run on the east to Chancellorsville on the west. It is famous in military history for the battles of Chancellorsville (1863) and Wilderness (1864) during the American Civil War.

Chancellorsville.—In May 1863 a three days' battle was fought at Chancellorsville between the Army of the Potomac, under Gen. Hooker, and Gen. *Lee's* army of Northern Virginia, which had stemmed the previous tide of invasion in the east by holding successfully a position on the heights along the right or south bank of the Rappahannock. Gen. Burnside had suffered a severe repulse in front of the Confederate position at Fredericksburg in Dec. 1862, and his successor resolved to adopt the alternative plan of turning *Lee's* flank and so gaining the road to Richmond. *Lee* was at the time weakened through having, by direction of the War Department, detached *Longstreet's* two divisions and three cavalry brigades to collect provisions from the neighbourhood of Suffolk, 120m. distant. Hooker had now at his disposal 12,000 cavalry, 400 guns, and 120,000 infantry and artillery, organized in seven corps (I. Reynolds, II. Couch, III. Sickles, V. Meade, VI. Sedgwick, XI. Howard, XII. Slocum). *Lee* counted only 55,000 men of all arms effective. Hooker detached 10,000 cavalry, under Stoneman, to sweep round *Lee's* left, destroy the railways in *Lee's* rear and cut his line of retreat, and the I. and VI. corps under Sedgwick (40,000) to cross below Fredericksburg and pin *Lee* in his entrenched position, while with the remainder he himself turned *Lee's* left by a wide manoeuvre. Hooker moved up the Rappahannock, crossed that river and afterwards the Rapidan, and on April 30 fixed his headquarters at Chancellorsville, a farmhouse in the Wilderness. *Lee's* cavalry under *Stuart* had duly reported the Federal movements and *Lee,* judging that Sedgwick's advance was only a feint, called up *"Stonewall" Jackson's* four divisions from below the Massaponax as soon as Sedgwick's corps crossed the river at Fredericksburg. At Chancellorsville, *Anderson's* division was in position, and *McLaws* was sent to support him, while *Jackson* took three divisions to the same point, leaving *Early's* division (10,000) to observe Sedgwick. At 11 A.M. on May 1, Hooker began his advance towards Fredericksburg, an advance which was intended to be a hammer crushing *Lee* against Sedgwick's anvil. But when he encountered the columns of the Confederates, also advancing, in the forest tracts of the Wilderness, the absence of all but a fraction of his cavalry meant an absence of information. Believing that the whole of *Lee's* army was upon him, he fell back to Chancellorsville, where he had cleared and entrenched a position in the forest. This was almost impregnable to attack from the east or south—and Hooker decided to invite such an attack. *Lee,* however, discovered a route by which the Federals might be attacked from the north and west, and arranged with *Jackson* to execute the turning movement and fall upon them. At 4 A.M. on May 2 *Jackson* marched westward with his corps of 26,000 men and by a détour of 15m. passed round the Federal right flank, then moved to take the Federals in reverse, while *Anderson* and *McLaws* with 17,000 men demonstrated in front of Hooker's army and so kept 70,000 men idle behind their earthworks. One of *Stuart's* cavalry brigades neutralized Stoneman's 10,000 horsemen. Sedgwick was being contained by *Early. Jackson's* attack at 6 P.M. surprised the Federals, who fled in panic at nightfall, but *Jackson* was mortally wounded, and with his fall the attack lost impetus and the chance of an annihilating victory. Next day the attack was resumed under the immediate direction of *Stuart,* who was reinforced by *Anderson,* while *McLaws* now threatened the left flank of the Federals and *Fitz Lee's* cavalry brigade operated against their line of retreat. Hooker finally gained the shelter of an inner line of works covering the ford by which he must retreat. Meanwhile *Early* had checked Sedgwick, who had already abandoned his attack when *Lee,* on receiving word that *Early* was

hard pressed, ceased to press Hooker's retreat and moved to *Early's* aid. Thus on May 4 Sedgwick was assailed by *Early, McLaws* and *Anderson,* and driven over the Rappahannock to join the remainder of Hooker's beaten army, which had recrossed the Rapidan on the night of May 5 and marched back to Falmouth. That day *Lee* had once more countermarched to concentrate afresh against Hooker, but his attack, delayed by rain, found that his quarry had slipped away. Phisterer's *Record* puts the Federal loss at 16,000 and the Confederates at 12,000 men.

See A. C. Hamlin, *The Battle of Chancellorsville* (1896); G. F. R. Henderson, *Stonewall Jackson* (1902); W. B. Wood and J. E. Edmonds, *The Civil War in the United States* (1905); *Battles and Leaders of the Civil War and Official Records of the War of Secession.*

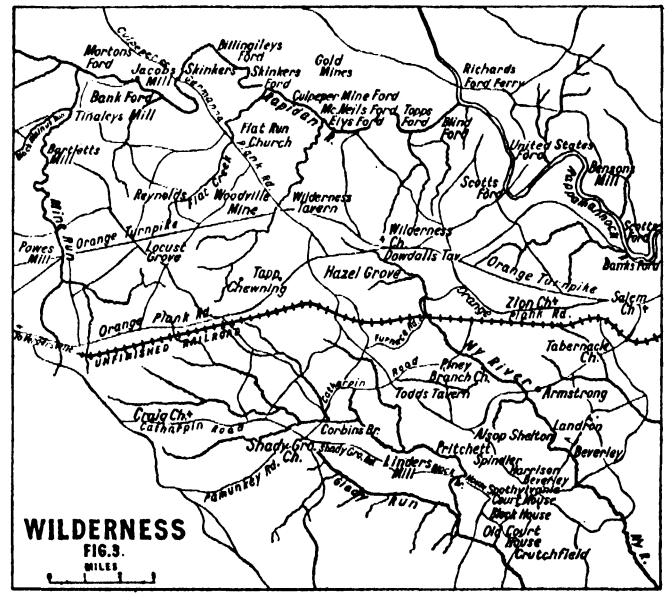
Grant's Campaign of the Wilderness and Cold Harbor.—On the evening of May 3, 1864, after dark, the Army of the Potomac, commanded by Meade and consisting of the II., V. and VI., and Cavalry Corps, left its winter quarters about Culpeper to manoeuvre across the Rapidan with a view to fighting a battle at or near New Hope church and Craig's church. The army and the IX. Corps (Burnside), which was an independent command, were directed by Lieut.-Gen. Grant, the newly appointed commander of the armies of the United States, who accompanied Meade's headquarters. The opposing Army of Northern Virginia under *Lee* lay in quarters around Orange Court house (*A. P. Hill's* Corps), Verdiersville (*Ewell's* Corps) and Gordonsville (*Longstreet's* Corps). The respective numbers were: Army of the Potomac, 98,000; IX. Corps, 22,000; Army of Northern Virginia, rather less than 70,000.

The crossing of the Rapidan was made at Germanna and Ely's fords, out of reach of *Lee's* interference, and in a few hours the two leading corps had reached their halting-places—V. (Warren), Wilderness tavern; and II. (Hancock), Chancellorsville. The VI. (Sedgwick) followed the V. and halted south of Germanna ford. Two of the three divisions of cavalry preceded the march and scouted to the front and flanks. Controversy has arisen as to whether the early halt of the Union army in the midst of the Wilderness was not a serious error of judgment. The reason assigned was the necessity of protecting an enormous wagon train, carrying 15 days' supplies for the whole army, that was crossing after II. Corps at Ely's ford. Burnside's corps was far to the rear when the advance began, but by making forced marches it was able to reach Germanna ford during May 5. On that day the manoeuvre towards Craig's church was resumed at 5 A.M., covered by Wilson's cavalry division, while Gregg's unit moved towards Fredricksburg.

Grant's intention of avoiding a battle until he was clear of the Wilderness was not achieved, for Confederate infantry appeared on the Orange turnpike east of Mine Run, where on his own initiative Warren had posted a division of the V. Corps overnight as flank-guard, and some cavalry, judiciously left behind by Wilson at Parker's store, became engaged a little later with hostile forces on the Orange Plank road. This led to the suspension of the whole manoeuvre—wherein Grant's object was to place himself between *Lee* and Richmond. The first idea of the Union headquarters was that *Lee* was falling back to the North Anna, covered by a bold rear guard, which Grant and Meade arranged to cut off and destroy by a convergent attack of Warren and Sedgwick. But the appearance of infantry on the Plank road as well as the Pike had shown that *Lee* intended to fight in the Wilderness, and Hancock (II. Corps) was called in from Todd's tavern, while one division (Getty's) of the VI. was hurried to the intersection of the Brock and Plank roads to hold that point until Hancock's arrival. Getty arrived just in time, for Confederate skirmishers were found dead and wounded only 3cyd. from the cross roads. The division then formed up to await Hancock's arrival up the Brock road, practically unmolested, for *Lee* had only two of his corps on the ground (*Hill* on the Plank road, *Ewell* on the Pike), and did not desire to force a decision until *Longstreet's* distant corps should arrive.

Meanwhile Warren had been slowly forming up his attacking line with great difficulty in the woods. Grant appears to have used bitter words to Meade on the subject of Warren's delays, and Meade passed these on to Warren, who in turn forced his subordinates into premature action. The result of the attack by the V. and later the VI. Corps, delivered piecemeal owing to the difficulties of direction and touch in the woods, on *Ewell* was completely unsatisfactory, and for the rest of the battle these corps were used principally as reservoirs to find supports for the offensive wing under Hancock, who arrived on the Plank road 2 P.M.

Hancock's divisions, as they came up, entrenched themselves along the Brock road. In the afternoon he was ordered to attack whatever force of the enemy was on the Plank road in front of him, but was unwilling to do so until he had his forces well in hand. Finally Getty was ordered to attack "whether Hancock was ready or not." This may have been an attempt to force Hancock's hand by an appeal to his soldierly honour, and as a fact he did not leave Getty unsupported. But the disjointed attacks of the II. Corps on *Hill's* entrenchments, while forcing the Confederates to the verge of ruin, were not so successful as the preponderance of force on the Union side ought to have ensured. For four hours the two lines of battle were fighting 50yd. apart, until at nightfall the contest was given up through mutual exhaustion.



The battle of the 6th was timed to begin at 5 A.M., and Grant's attack was wholly directed on Parker's store, with the object of crushing *Hill* before *Longstreet* could assist him. If *Longstreet,* instead of helping *Hill,* were to attack the extreme Union left, so much the better; but the far more probable course for him to take was to support *Hill* on or north of the Plank road, and Grant not only ordered Hancock with six of the eleven divisions of Meade's army to attack towards Parker's store, but sent his own "mass of manoeuvre" (the IX. Corps) thither in such a way as to strike *Hill's* left. The cavalry was drawn back for the protection of the trains, for "every musket" was required in the ranks of the infantry. Wilson's division, in its movement on Shady Grove church on the 5th, had been cut off by the enemy's advance on the Plank road and attacked by some Confederate cavalry. But it extricated itself and joined Gregg, who had been sent to assist him, at Todd's tavern. Warren and Sedgwick were to hold *Ewell* occupied on the Pike by vigorous attacks. At 5 o'clock Hancock advanced, drove back and broke up *Hill's* divisions, and on his right Wadsworth attacked their left rear. But after an hour's wood fighting the Union attack came to a standstill, and at this moment, the critical moment for the action of the IX. Corps, Burnside was still more than a mile away, having scarcely passed through Warren's lines into the woods. Then *Longstreet's* Corps, pushing its way in two columns of fours through *Hill's* retreating groups, attacked Hancock with the greatest fury and forced him back some hundreds of yards. But the woods broke the force of this attack too, and by 7.30 the battle had become a stationary fire-fight. After an interval in which both sides rallied their confused masses, *Longstreet* attacked again and gained more ground. Persistent rumours came into the Union headquarters of a Confederate advance against the Union left rear, and when Grant realized the situation he broke off one of Burnside's divisions from the IX. Corps column and sent it to the cross-roads as direct reserve to Hancock. At this moment the battle took a very unfavourable turn on the Plank road. *Longstreet* had sent four brigades of infantry by a détour through the woods south of the Plank road to attack Hancock's left. This was very effective, and the Union troops were hustled back to the cross-roads. But *Longstreet,* like *Jackson* a year before in these woods, was wounded by his own men, and the battle again came to a standstill (2.30 P.M.).

Burnside's Corps, arriving shortly before 10 A.M. near Chewning's house, the position whence it was to have attacked *Hill's* left in the early morning, was about to attack, in ignorance of Hancock's repulse, when fortunately an order reached it to suspend the advance and to make its way through the woods towards Hancock's right. This dangerous flank march, screened by the woods, was completed by 2 P.M., and Burnside began an attack upon the left of *Longstreet's* command (*R. H. Anderson's* fresh division of *Hill's* Corps). But Hancock being in no condition to support the IX. Corps, the whole attack was, at 3 P.M., postponed by Grant's order until 6 P.M. Thus there was a long respite for both sides, varied only by a little skirmishing. But *Lee* was determined, as always, to have the last word, and about 4.15–4.30 a fierce assault was delivered amidst the burning woods upon Han-

cock's entrenchments along the Brock road. For a moment, aided by the dense smoke, the Confederates seized and held the first line of works, but a counter-stroke dislodged them. Burnside, though not expecting to have to attack before 6, put into the fight such of his troops as were ready, and at 5.30 or thereabouts the assaulting line receded into the woods. Grant cancelled his order to attack at 6, and at the decisive point the battle was at an end. But on the extreme right of the Union army a sudden attack was delivered at sunset upon the hitherto unmolested VI. Corps, by *Gordon,* one of *Ewell's* brigadiers. This carried off two generals and several hundred prisoners, and caused a panic to ensue which affected all the Union forces on the Pike and lasted until after nightfall.

Lee, therefore, had the last word on both flanks, but in spite of this and of the very heavy losses[1], Grant had already resolved to go on, instead of going back like his various predecessors. To him, indeed, the battle of the Wilderness was a victory, an indecisive victory indeed, but one that had given him a moral superiority which he did not intend to forfeit. His scheme, drafted early on the morning of the 7th, was for the army to march to Spottsylvania on the night of the 7th–8th, to assemble there on the 8th, and thence to undertake a fresh manoeuvre against *Lee's* right rear on the 9th. This movement required the trains with the fighting line to be cleared away at once from the roads needed for the troops and *Lee* promptly discovered that a movement was in progress. He mistook its object, however, and assuming that Grant was falling back on Fredericksburg, he prepared to shift his own forces to the south of that place so as to bar the Richmond road. This led to a race for Spottsylvania, which was decided more by accidents to either side than by the measures of the two commanding generals. On the Union side Warren was to move to the line Spottsylvania Court house–Todd's tavern, followed by Hancock; Sedgwick was to take a roundabout route and to come in between the V. and II. Corps; Burnside to follow Sedgwick. The cavalry was ordered to watch the approaches towards the right of the army. The movement began promptly after nightfall on the 7th. But ere long the head of Warren's column, passing in rear of Hancock's line of battle, was blocked by the headquarters escort of Grant and Meade. Next, the head of the V. Corps was again checked at Todd's tavern by two cavalry divisions which had been sent by Sheridan to regain the ground at Todd's tavern[2], given up on the 6th, and after fighting the action of Todd's tavern had received no further orders from him. Meade, greatly irritated, ordered Gregg's division out towards Corbin's bridge and Merritt's to Spottsylvania. On the latter road the Union cavalry found themselves opposed by *Fitz Lee's* cavalry, and after some hours of disheartening work in the woods, Merritt asked Warren to send forward infantry to drive the enemy. This Warren did, although he was just preparing to rest and to feed his men after their exhausting night-march. Robinson's division at the head of the corps deployed and swiftly drove in *Fitz Lee.* A little beyond Alsop's, however, Robinson found his path barred by entrenched infantry. This was part of *Anderson's* (formerly *Longstreet's*) corps. That officer had been ordered to draw out of his (Wilderness) works, and to bivouac, preparatory to marching at 3 A.M. to the Court house, but, finding no good resting-place, he had moved on at once by way of the Catharpin road and Corbin's bridge. At or near Block House bridge the corps halted to rest, but *Stuart* (who was with *Fitz Lee*) called upon *Anderson* for assistance and the march was resumed at full speed. Sheridan's new orders to Gregg and Merritt did not arrive until Meade had given these officers other instructions, but Wilson's cavalry division, which was out of the line of march of the infantry, acted in accordance with Sheridan's plan of occupying the bridges in front of the position that the army intended to occupy at Spottsylvania Court house, and seized that place, inflicting a smart blow upon a brigade of *Stuart's* force.

The situation about 9 A.M. on the 8th was therefore curious. Warren, facing east, and opposed by part of *Anderson's* corps, was seeking to fight his way to Spottsylvania Court house by the Brock road. Wilson facing south, was holding the Court house and driving *Fitz Lee's* cavalry partly westward on to the backs of the infantry opposing Warren, partly towards Block House bridge, whence the rest of *Anderson's* infantry was approaching. All the troops were weary and hungry, and Sheridan ordered Wilson to evacuate the Court house and to fall back over the Ny. Warren fruitlessly attacked the Confederate infantry at Spindler's, Robinson being severely wounded and his division disorganized. The other divisions came up by degrees, and another attack was made about 11. It was pressed close up to, and in some places over, the Confederate log-works, but it ended in failure like the first. A third attempt in the evening dwindled down to a reconnaissance in force. *Anderson* was no longer isolated. *Early's* division observed Hancock's corps at Todd's tavern, but the rest of *Ewell's* and all *Hill's* corps went to Spottsylvania and prolonged *Anderson's* line northward towards the Ny. Thus the re-grouping of the Union army for manoeuvre, and even the running fight or strategic pursuit imagined by Grant when he found *Anderson* at Spottsylvania, were given up, and on the 9th both armies rested. On this day Sedgwick was killed by a long-range shot from a Confederate rifle. His place was taken by H. G. Wright. On this day also a violent quarrel between Meade and Sheridan led to the departure of the cavalry corps on an independent mission. This was the so-called Richmond raid, in which Sheridan defeated *Stuart* at Yellow tavern (where *Stuart* was killed) and captured the outworks of Richmond, but, having started with empty forage wagons[3], had then to make his way down the Chickahominy to the nearest supply depots of the Army of the James, leaving the Confederate cavalry free to rally and rejoin *Lee.*

The situation about 9 A.M. on the 8th was therefore curious.

Finding the enemy thus gathered in his front, Grant decided to fight again on the 10th. While Hancock opposed *Early,* and Warren and Wright faced *Hill* and *Anderson,* Burnside was ordered by Grant to work his way to the Fredericksburg-Spottsylvania road, thence to attack the enemy's right rear. The first stage of this movement of the IX. Corps was to be made on the 9th, but not the attack itself, and Burnside was consequently ordered not to go beyond a placed called "Gate" on the maps used by the Union staff. This, it turned out, was not the farm of a person called Gate, as headquarters supposed, but a mere gate into a field. Consequently it was missed, and the IX. Corps went on to Gale's or Gayle's house, where the enemy's skirmishers were driven in[4].

[1]The Union losses in the battle were 18,000, the Confederates at least 11,500.

[2]In consequence of a mistaken order that the trains which he was protecting were to move forward to Piney Branch church.

[3]Owing to the circumstances of his departure, the angry army staff told him to move out at once with the forage that he had, and Sheridan, though the army reserve supplies were at hand, made no attempt to fill up from them.

[4]A further source of confusion, for the historian at least, is that on the survey maps made in 1867 this "Gayle" is called "Beverly."

The news of an enemy opposing Burnside at "Gate," which Grant still supposed to be the position of the IX. Corps, at once radically altered the plan of battle. *Lee* was presumed to be moving north towards Fredericksburg, and Grant saw an opportunity of a great and decisive success. The IX. Corps was ordered to hold its position at all costs, and the others were to follow up the enemy as he concentrated upon Burnside. Hancock was called in from Todd's tavern, sent down to force the fords on the Po at and below Tinder's mill, and directed upon Block House bridge by an officer of Grant's own staff, while Warren and Wright were held ready. But once more a handful of cavalry in the woods delayed the effective deployment of the moving wing, and by the time that the II. Corps was collected opposite Block House bridge it was already night. Still there was, apparently, no diminution of force opposite Burnside, and Hancock was ordered to resume his advance at early dawn on the 10th.

Meade, however, had little or no cognizance of Grant's orders to the independent IX. Corps, and his orders, conflicting with those emanating from the Lieutenant-General's staff, puzzled Hancock and crippled his advance. At 10 the whole scheme was given up, and the now widely deployed Union army closed on its centre as best it could for a direct attack on the Spottsylvania position. At 4, before the new concentration was complete, and while Hancock was still engaged in the difficult operation of drawing back over the Po in the face of the enemy, Warren attacked unsupported and was repulsed. In the woods on the left Wright was more successful, and at 6 P.M. a rush of 12 selected regiments under Col. Emory Upton carried the right of *Lee's* log-works. But for want of support this attack too was fruitless, though Upton held the captured works for an hour and brought off 1,000 prisoners. Burnside, receiving Grant's new orders to attack from Gayle's towards Spottsylvania, sent for further orders as to the method of attack, and his advance was thus made too late in the day to be of use. *Lee* had again averted disaster, this time by his magnificent handling of his only reserve, *Hill's* (now *Early's*) corps, which he used first against Hancock and then against Burnside with the greatest effect.

This was the fourth battle since the evening of May 4. On the morning of the 11th Grant sent his famous message to Washington, "I purpose to fight it out on this line if it takes all summer." The 12th was to be the fifth and, Grant hoped, the decisive battle. A maze of useful and useless entrenchments had been constructed on both sides, especially on the Union side, from mere force of habit. Grant, seeing from the experience of the 10th that his corps commanders were manning these entrenchments so strongly that they had only feeble forces disposable for the attack, ordered all superfluous defences to be given up. Three corps were formed in a connected line (from right to left, V., VI., IX.) during the 11th, and that night Hancock's corps moved silently to a position between Wright and Burnside and formed up in the open field at Brown's in an attacking mass of Napoleonic density—three lines of divisions, in line and in battalion and brigade columns. Burnside was to attack from Gayle's (Beverly's on the map) towards McCool's. Warren and Wright were to have at least one division each clear of their entrenchments and ready to move.

Up to the 11th *Lee's* line had extended from the woods in front of Block House bridge, through Perry's and Spindler's fields to McCool's house, and its right was diffused and formed a loop round McCool's. All these works faced north-west. In addition, Burnside's advance had caused *Early's* corps to entrench Spottsylvania and the church to the south of it, facing east. Between these two sections were woods. The connection made between them gave the loop round McCool's the appearance from which it derives its historic name of The Salient. Upon the northern face of this salient Hancock's attack was delivered.

On the 11th the abandonment of Burnside's threatening advance on his rear and other indications had disquieted *Lee* as to his left or Block House flank, and he had drawn off practically all *Ewell's* artillery from the McCool works to aid in that quarter. The infantry that manned the Salient was what remained of *Stonewall Jackson's* "foot cavalry," veterans of Antietam, Fredericksburg and Chancellorsville. But at 4.35, in the mist, Hancock's mass swept over their works at the first rush and swarmed in the interior of the Salient, gathering thousands of prisoners and seizing the field batteries that *Lee* had sent back just too late.

The thronging and excited Federals were completely disordered by success, and the counter-attack of one or two Confederate brigades in good order drove them back to the line of the captured works. Then, about 6, there began one of the most remarkable struggles in history. While *Early*, swiftly drawing back from Block house, checked Burnside's attack from the east, and *Anderson*, attacked again and again by parts of the V. Corps, was fully occupied in preserving his own front, *Lee*, with *Ewell's* corps and the few thousand men whom the other generals could spare, delivered all day a series of fierce counter-strokes against Hancock. Nearly all Wright's corps and even part of Warren's (in the end 45,000 men) were drawn into the fight at the Salient, for Grant and Meade well knew that *Lee* was struggling to gain time for the construction of a retrenchment across the base of it. If the counter-attacks failed to gain this respite, the Confederates would have to retreat as best they could, pressed in front and flank. But the initial superiority of the Federals was neutralized by their disorder, and keeping the fight alive by successive brigade attacks, while the troops not actually employed were held out of danger till their time came, *Lee* succeeded so well that after twenty hours' bitter fighting the new line was ready and the Confederates gave up the barren prize to Hancock. *Lee* had lost 4,000 prisoners as well as 4,500 killed and wounded, as against 7,000 in the Army of the Potomac and the IX. Corps.

There were other battles in front of Spottsylvania, but that of the 12th was the climax. From the 13th to the 20th the Federals gradually worked round from west to east, delivering a few partial attacks in the vain hope of discovering a weak point. *Lee's* position, now semicircular, enabled him to concentrate on interior lines on each occasion. In the end the Federals were entrenched facing east, between Beverly's house (Burnside's old "Gayle") and Quisenberry's, *Lee* facing west from the new works south of Harrison's through the Court house to Snell's bridge on the Po. In the fork of the Po and the Ny, with woods and marshes to obstruct every movement, Grant knew that nothing could be done, and he prepared to execute a new manoeuvre. But here as in the Wilderness, *Lee* managed to have the last word. While the Union army was resting in camp for the first time since leaving Culpeper, *Ewell's* corps suddenly attacked its baggage-train near Harris's house. The Confederates were driven off, but Grant had to defer his intended manoeuvre for two days. When the armies left Spottsylvania, little more than a fortnight after breaking up from winter quarters, the casualties had reached the totals of 35,000 out of an original total of 120,000 for the Union army, 26,000 out of 70,000 for the Confederates.

The next manoeuvre attempted by Grant to bring *Lee's* army to action "outside works" was of an unusual character, though it had been foreshadowed in the improvised plan of crushing *Lee* against Burnside's corps on the 9th. Hancock was now (20th) ordered to move off under cover of night to Milford; thence he was to march south-west as far as possible along the Richmond and Fredericksburg railroad and to attack whatever force of the enemy he met. It was hoped that this bold stroke by an isolated corps would draw *Lee's* army upon it, and the rest of the Army of the Potomac would, if this hope were realized, drive down upon *Lee's* rear while Hancock held him up in front. Supposing, however, that *Lee* did not take the bait, the manoeuvre would resolve itself into a turning movement with the object of compelling *Lee* to come out of his Spottsylvania lines on pain of being surrounded.

Hancock's corps started on the night of the 20th-21st. The alarm was soon given. At Milford, where he forced the passage of the Mattapony, Hancock found himself in the presence of hostile infantry from Richmond and heard that more had arrived at Hanover junction. He therefore suspended his advance and entrenched. The main army began to move off, after giving *Lee* time to turn against Hancock, at 10 A.M. on the 21st, and marched to Catlett's, a place a few miles south-west of Guinea's bridge, Warren leading, Burnside and Wright following. But no news came in from Hancock until late in the evening, and the develop-

ment of the manoeuvre was consequently delayed, so that on the night of the 21st–22nd *Lee's* army slipped across Warren's front *en route* for Hanover junction. The other Confederate forces that had opposed Hancock likewise fell back. Grant's manoeuvre had failed. Its principal aim was to induce *Lee* to attack the II. Corps at Milford, its secondary and alternative purpose was, by dislodging *Lee* from Spottsylvania, to force on an encounter battle in open ground. But he was only offered the bait—not compelled to take it, as he would have been if Hancock with two corps had been placed directly athwart the road between Spottsylvania and Hanover junction—and, having unimpaired freedom of action, he chose to retreat to the junction. The four Union corps, therefore, could only pursue him to the North Anna, at which river they arrived on the morning of the 23rd, Warren on the right, Hancock on the left, Wright and Burnside being well to the rear in second line. The same afternoon Warren seized Jericho ford, brought over the V. Corps to the south side, and repulsed a very sharp counter-stroke made by one of *Lee's* corps. Hancock at the same time stormed a Confederate redoubt which covered the Telegraph Road bridge over the river. Wright and Burnside closed up. It seemed as if a battle was at hand, but in the night reports came in that *Lee* had fallen back to the South Anna; and as these were more or less confirmed by the fact that Warren met with no further opposition and by the enemy's retirement from the river bank on Hancock's front, the Union generals gave orders, about midday on the 24th, for what was practically a general pursuit. This led incidentally to an attempt to drive *Lee's* rearguard away from the point of passage, between Warren's and Hancock's, required for Burnside, and in the course of this it became apparent that *Lee's* army had not fallen back but was posted in a semicircle to which the North Anna formed a tangent. On the morning of the 25th this position was reconnoitred and found to be more formidable than that of Spottsylvania. Moreover, it divided the two halves of the Union army that had crossed above and below.

Grant gave up the game as drawn and planned a new move. This had as its objects, first, the seizure of a point of passage on the Pamunkey; secondly, the deployment of the Army of the Potomac and of a contingent expected from the Army of the James, and thirdly, the prevention of *Lee's* further retirement, which was not desired by the Union commanders, owing to the proximity of the Richmond defences and the consequent want of room to manoeuvre. On the 27th Sheridan's cavalry and a light division of infantry passed the Pamunkey at Hanover town, and the two divided wings of the Army of the Potomac were withdrawn over the North Anna without mishap—thanks to exactitude in arrangement and punctuality in execution. On the 28th the Army of the Potomac had arrived near Hanover town, while at Hawes's shop, on the road to Richmond, Sheridan had a severe engagement with the enemy's cavalry. *Lee* was now approaching from Hanover junction via Ashland, and the Army of the Potomac swung round somewhat to the right so as to face in the presumed direction of the impending attack. The Confederate general, however, instead of attacking, swerved south, and planted himself behind the Totopotomoy. Here he was discovered, entrenched as always, on the 29th, and skirmishing all along the line, varied at times by more severe fighting, occupied that day and the 30th. On the morning of the 31st the Union army was arranged from right to left in the order VI., II., IX. and V. Corps, Sheridan having drawn off to the left rear of the infantry.

Now, for the last time in the campaign, the idea of a hammer and anvil battle was again taken up, the "anvil" being Smith's XVIII. Corps, which had come up from the James river to White house on the 30th; but once more the lure failed because it was not made sufficiently tempting.

The last episode of the campaign centred in Cold Harbor, a village close to the Chickahominy, which Sheridan's cavalry seized on the 31st. Here, contrary to the expectation of the Union staff, a considerable force of Confederate infantry—new arrivals from the James—was met; and in the hope of bringing on a battle before either side had time to entrench, Grant and Meade ordered Sheridan to hold the village at all costs and directed Wright's (VI.) Corps, from the extreme right wing, and Smith's (XVIII.), from Old Church, to march thither with all possible speed, Wright in the night of May 31 and Smith on the morning of June 1. *Lee* had actually ordered his corps commanders to attack, but was too ill to enforce his wishes, and in the evening Wright and Smith themselves assaulted the Confederate front opposite Cold Harbor. The assault, though delivered by tired men, was successful. The enemy's first or skirmish line was everywhere stormed, and parts of the VI. Corps even penetrated the main line. Grant at once prepared to renew the attack, as at Spottsylvania, with larger forces, bringing Hancock over from the right of the line on the night of the 1st and ordering Hancock, Wright and Smith to assault on the next morning. But *Lee* had by now moved more forces down, and his line extended from the Totopotomoy to the Chickahominy. Hancock's corps, very greatly fatigued by its night march, did not form up until after midday, and meanwhile Smith, whose corps, originally but 10,000 strong, had been severely tried by its hard marching and fighting on the 1st, refused to consider the idea of renewing the attack. The passive resistance thus encountered dominated Grant's fighting instinct for a moment. But after reconsidering the problem he again ordered the attack to be made by Wright, Smith and Hancock at 5 P.M. A last modification was made when, during the afternoon, *Lee's* far distant left wing attacked Burnside and Warren. This, showing that *Lee* had still a considerable force to the northward, and being, not very inaccurately, read to mean that the 6m. of Confederate entrenchments were equally—*i.e.*, equally thinly—guarded at all points, led to the order being given to all five Union corps to attack at 4:30 A.M. on June 3.

The resolution to make this plain, unvarnished frontal assault on entrenchments has been as severely criticized as any action of any commander in the Civil War, and Grant himself subsequently expressed his regret at having formed it. But such criticisms derive all their force from the event, not from the conditions in which, beforehand, the resolution was made. The risks of failure were deliberately accepted, and the battle—if it can be called a battle—was fought as ordered. The assault was made at the time arranged and was repulsed at all points with a loss to the assailants of about 8,000 men. Thereafter the two armies lay for ten days less than 100yd. apart. There was more or less severe fighting at times, and an almost ceaseless bickering of skirmishers. Owing to Grant's refusal to sue for permission to remove his dead and wounded in the terms demanded, *Lee* turned back the Federal ambulance parties, and many wounded were left to die between the lines. It was only on the 7th that Grant pocketed his feelings and the dead were buried.

This is one of the many incidents of Cold Harbor that must always rouse painful memories—though to blame *Lee* or Grant supposes that these great generals were infinitely more inhuman here than at any other occasion in their lives and takes no account of the consequences of admitting a defeat at this critical moment, when the causes for which the Union army and people contended were about to be put to the hazard of a presidential election.

The Federal army lost, in this month of almost incessant campaigning, about 50,000 men, the Confederates about 32,000. Though the aggregate of the Union losses awed both contemporaries and historians of a later generation, proportionately the losses of the South were heavier (46% of the original strength as compared with 41% on the Union side); and whereas within a few weeks Grant was able to replace nearly every man he had lost by a new recruit, the Confederate Government was near the end of its resources.

WILDGANS, ANTON (1881–), Austrian poet and dramatist, was born in Vienna on April 17, 1881, began and completed a course of legal studies in Vienna university and was artistic manager of the celebrated Burgtheater there 1921–24. In 1909 he attracted notice by a book of verses *Herbstfrühling*, and in a series of lyrical volumes he gave expression to erotic

passion, to deep sympathy with nature and with human suffering. Wildgans appears to be connected with the Hofmannsthalists, although maintaining his independence. His plays, *Armut* (1914), *Liebe* (1916) and *Dies Irae* (1918) begin in an atmosphere of realism, culminating in that of symbolism or mysticism. As a counterpart to this *bürgerliche* trilogy another of mythological or religious character is planned, the first part of which, *Kain,* was acted in 1921. An epic poem, written in hexameters, *Kirbisch* (1927), depicts Austrian mentality as influenced by the World War.

WILD GINGER (*Asarum canadense*), called also Canada snake-root and colic-root, a small North American herb of the birthwort family (Aristolochiaceae), native to rich woods from New Brunswick to Manitoba and southward to North Carolina and Kansas. It is a stemless perennial with a creeping aromatic root-stock having the flavour of ginger. From this usually rise two large kidney-shaped or heart-shaped leaves, 4 in. to 7 in. broad, on nearly erect leaf-stalks 6 in. to 12 in. long. On a short stalk between the bases of the two leaf-stalks is borne a single somewhat bell-shaped, brownish-purple flower, about an inch broad, with three small more or less pointed lobes on the rim. About 9 other species of wild ginger are found in the United States, and 3 species are native to the Pacific coast. Among these are the halberd-leaved wild ginger (*A. arifolia*), found from Virginia and Tennessee southward, and the western wild ginger (*A. caudatum*), native to the coast redwood belt of California and northward to British Columbia. The European species is asarabacca (*q.v.*).

WILEY, HARVEY WASHINGTON (1844–), American chemist, was born in Kent, Indiana, Oct. 18, 1844. He was educated at Hanover (Ind.) college, Indiana Medical college and Harvard. He served as State chemist of Indiana and professor of chemistry at Purdue university (1874–83), and in 1883 became chief of the Bureau of Chemistry in the U.S. Department of Agriculture. This position he held with signal success until his resignation in 1912. He was the chief force behind the passage of the Pure Food and Drugs Act in 1906, and devoted his energies to its enforcement. Pressure was exercised in 1911 to obtain his dismissal on the technical charge that an expert in his department had received recompense exceeding the legal rate. President Taft wholly exonerated him. Dr. Wiley resigned in 1912, thereafter devoting himself largely to the cause of pure food by lecturing and writing. From 1899 on he was professor of agricultural chemistry at George Washington university.

Beside some 60 government pamphlets and several hundred scientific papers he wrote: *The Sugar Industry of the United States* (1885); *Principles and Practice of Agricultural Analysis* (3 vol. 1894–97; rev. ed., 1906–14); *Foods and Their Adulterations* (1907, 3rd ed., 1917); *The Lure of the Land* (1915); *Not by Bread Alone; The Principles of Human Nutrition* (1915); *1001 Tests of Foods, Beverages and Toilet Accessories* (1916); and *Beverages and Their Adulteration* (1919). He also edited a series of *Health Readers for Schools* in 1919.

WILEY, LOUIS (1869–), newspaper manager, born at Hornell, N.Y., May 31, 1869. He received a private school education at Mt. Sterling, Ky. In 1887 he joined the staff of the Rochester (N.Y.) *Post-Express* as a reporter and in 1893 was appointed business manager. He was also editor and publisher of *The Tidings* at Rochester, 1887–95. In 1896 he became associated with *The New York Times* and has been business manager of that newspaper since 1906. He is a member of the executive committee of the League of Nations Non-Partisan Association, president of the Steuben County Society, vice-president of the 42nd Street Property Owners' and Merchants' Association, the Broadway Association and the Lafayette Memorial; director of the Federated General Relief Committee, Society of the Genesee, Municipal Art Society, Authors' League Fund, and Kentucky Society.

WILFRID (*c.* 634–709), English archbishop, born in Northumbria. He attracted the notice of the queen, Eanfled, who placed him in care of an old noble, Cudda, then a monk at Lindisfarne. Later on Eanfled enabled him to visit Rome in the company of Benedict Biscop. On leaving Rome he spent three years with Annemund, archbishop of Lyons. After the murder of his patron he returned to England, where he received a monastery at Ripon, and then took priest's orders.

He was probably already regarded as the leading exponent of the Roman discipline in England when his speech at the council of Whitby determined the overthrow of the Celtic party (664). About a year later he was consecrated to the see of York, not, however, in England, where perhaps he could not find the fitting number of orthodox prelates, but at Compiègne. On his return journey he narrowly escaped the pagan wreckers of Sussex, and reached England to find Ceadda (St. Chad) installed in his see.

The rest of his life is largely a record of wandering and misfortune. For three years (665–668) he ruled his monastery at Ripon in peace, though acting as bishop in Mercia and Kent during vacancies in sees there. On Archbishop Theodore's arrival (668) he was restored to his see, and spent in it nine years of ceaseless activity, especially in building churches, only to be driven out through the anger of King Ecgfrith's queen (677).

After Ecgfrith's death (May 20, 685) Wilfrid was restored to York (much circumscribed), and Ripon (686–687). He was once more driven out in 691–692, and spent seven years in Mercia. A great council of the English Church held in Northumbria excommunicated him in 702. He again appealed to Rome in person, and obtained another decision in his favour (703–704). He died at Oundle in Northamptonshire as he was going on a visit to Ceolred, king of Mercia (709). He was buried at Ripon.

Wilfrid's is a memorable name in English history, not only because of the large part he played in supplanting the Celtic discipline and in establishing a precedent of appeal to papal authority, but also by reason of his services to architecture and learning. At York he renewed Paulinus's old church, roofing it with lead and furnishing it with glass windows; at Ripon he built an entirely new basilica with columns and porches; at Hexham in honour of St. Andrew he reared a still nobler church, over which Eddius grows eloquent. In the early days of his bishopric he used to travel about his diocese attended by a little troop of skilled masons. He seems to have also reformed the method of conducting the divine services by the aid of his skilled chanters, Aedde and Aeona, and to have established or renewed the rule of St. Benedict in the monasteries. On each visit to Rome it was his delight to collect relics for his native land; and to his favourite basilica at Ripon he gave a bookcase wrought in gold and precious stones, besides a splendid copy of the Gospels.

Wilfrid's life was written shortly after his death by Eddius at the request of Acca, his successor at Hexham, and Tatbert, abbot of Ripon—both intimate friends of the great bishop. Other lives were written by Frithegode in the 10th, by Folcard in the 11th, and by Eadmer early in the 12th century. *See* also Bede's *Hist. Eccl.* v. 19, iii. 25, iv. 13, etc. All the lives are printed in J. Raine's *Historians of the Church of York,* vol. i. "Rolls" series.

WILHELMINA [WILHELMINA HELENA PAULINE MARIA OF ORANGE-NASSAU] (1880–), queen of the Netherlands, was born at The Hague on Aug. 31, 1880. Her father, William III. (Willem Paul Alexander Frederik Lodewijk), had by his first wife, Sophia Frederika Mathilde of Württemberg, three sons, all of whom predeceased him. Having been left a widower on June 3, 1877, he married on Jan. 7, 1879, Adelheid Emma Wilhelmina Theresia, second daughter of Prince George Victor of Waldeck-Pyrmont, born on Aug. 2, 1858, and Wilhelmina was the only issue of that union. She succeeded to the throne on her father's death, which took place on Nov. 23, 1890, but until her eighteenth year, when she was "inaugurated" at Amsterdam on Sept. 6, 1898, the business of the state was carried on under the regency of the queen-mother, in accordance with a law made on Aug. 2, 1884. On Feb. 7, 1901 Queen Wilhelmina married Henry Wladimir Albert Ernst, duke of Mecklenburg-Schwerin (born on April 19, 1876). To the great joy of the Dutch people, Queen Wilhelmina, on April 30, 1909, gave birth to an heir to the throne, the Princess Juliana (Juliana Louise Emma Maria Wilhelmina). *See* HOLLAND: *History.*

WILHELMSHAVEN, a town in the Prussian province of Hanover and the chief German naval station on the North sea; as such it played an important part in the World War. It is situated on the north-west shore of the Jade Busen. Pop. (1925) 25,484. The ground on which it stands (4 sq.m.) was purchased by Prussia from the grand-duke of Oldenburg in 1853,

when the Prussian navy was being formed. The construction of the harbour and town began in 1855, and the former was opened in 1869. Though reckoned a part of the Prussian province of Hanover it is completely surrounded on the landward side by Oldenburg territory. The harbour consists of three large basins and seven smaller ones as well as a basin for shipbuilding. There are six dry-docks. The harbour has three entries and locks are 260 metres long and 40 metres wide, with a depth of from 6½ to 10 metres at the quays. The establishment is defended by strong fortifications. The commercial harbour lies at the east end of the Ems-Jade canal. Wilhelmshaven exports agricultural produce and imports coal and timber.

WILKES, CHARLES (1798–1877), American naval officer and explorer, born in New York city April 3, 1798. He entered the U.S. Navy as a midshipman in 1818 and became a lieutenant in 1826. In 1830 he was placed in charge of the division of instruments and charts, and in 1838 was appointed to command an exploring and surveying expedition to the South Seas, authorized as the first of its kind by Congress in 1836. The expedition, including naturalists, botanists, mineralogists, taxidermists, a philologist, etc., left Hampton Roads Aug. 1838, stopped at various ports in South America and visited the Paumotu group of the Low Archipelago, the Samoan islands, and New South Wales. From Sydney, Wilkes sailed into the Antarctic ocean and along the Antarctic barrier from 150° to 97° E., reporting land at a number of points in the region which has subsequently been known as Wilkes Land. He visited the Fiji group and the Hawaiian islands in 1840, and in 1841 explored the west coast of the United States. The findings were timely in view of the dispute with Great Britain over the Oregon territory. He visited San Francisco bay, and the Sacramento river, and crossing the Pacific he called at the Philippine islands, Sulu archipelago, Borneo, Singapore, Polynesia and the Cape of Good Hope, reaching New York in June 1842, having sailed around the world. He served on the Coast Survey 1842–43 and in the latter year was advanced to the rank of commander. In 1844–61 he was chiefly engaged in preparing the report of the expedition. Twenty-eight volumes were planned but only 19 were published. Of these Wilkes wrote the *Narrative* (6 vols., 1844); and the volumes *Hydrography* (1851) and *Meteorology* (1851). At the outbreak of the Civil War Wilkes was assigned to the command of the "San Jacinto" to search for the Confederate commerce destroyer "Sumter." On Nov. 8, 1861, he stopped the British mail packet "Trent," and took off the Confederate commissioners to Europe, James M. Mason and John Slidell. Though he was officially thanked by Congress, his action was later disavowed by President Lincoln. Wilkes was commissioned commodore in 1862, and placed in command of a squadron sent to the West Indies to protect the U.S. commerce in that region. On July 25, 1866, he was promoted to the rank of rear-admiral on the retired list. He died at Washington Feb. 8, 1877.

In addition to many shorter articles, reports, etc., he published *Western America, including California and Oregon* (1849); *Voyage Around the World* (1849); and *Theory of the Winds* (1856). "The Diary of Wilkes in the Northwest" (E. S. Meany, ed.) appeared in the *Washington Historical Quarterly*, vol. 16–17 (1925–26).

WILKES, JOHN (1727–1797), English agitator and reformer, was born in St. John's Square, Clerkenwell. His father, Israel Wilkes, a successful malt distiller, came from a yeoman family of Leighton Buzzard. John was the second son; his elder brother, Israel, emigrated to America and became the father of (Admiral) Charles Wilkes (*q.v.*).

John Wilkes was schooled at Hertford and afterwards privately by the Rev. F. Leeson, a dissenting minister of Aylesbury, under whose charge he went to Leyden university in 1744. Here he learnt little—"Jack has great variety of talk. Jack is a scholar, Jack has the manners of a gentleman," said Dr. Johnson. He became close friends with Andrew Baxter and D'Holbach (*qq.v.*).

On his return to England, he married Miss Mary Mead, an Aylesbury heiress. "In my nonage," he says, "to please an indulgent father, I married a woman half as old again as myself; of a large fortune—my own being that of a gentleman. It was a sacrifice to Plutus, not to Venus. I stumbled at the threshold of the temple of Hymen:

"The god of love was not a bidden guest,
Nor present at his own mysterious feast."

Their marriage, uneventful for a time, and even successful while they lived at Aylesbury (they had one child, Mary), was broken up soon after Wilkes entered into politics, and they separated by mutual consent. Mrs. Wilkes had hardly any affection for either her husband or daughter, and she was scandalized by Wilkes' loose life and companions. He had been introduced by Thomas Potter, a finished profligate, to the society of Sir Francis Dashwood, chief of the "Medmenham Monks," of whom he became a member. This was a secret fraternity, which met occasionally in the summer in the ruins of St. Mary's abbey at Medmenham, for obscene orgies, in which it parodied Roman Catholic ritual. Dashwood, Lord Sandwich, Paul Whitehead, Potter, Wilkes and perhaps Charles Churchill the poet were among the ringleaders; the "order," whose reputation for indecency probably exceeded even the reality, was broken up by a practical joke of Wilkes', who unexpectedly released from a box a baboon disguised as a devil during a prayer addressed to Satan by Lord Orford, who nearly went out of his mind in the belief that his supplication was answered.

Partly under the encouragement of these friends, Wilkes had entered politics as a follower of Richard, Lord Temple (*q.v.*). He unsuccessfully fought Berwick in 1754, having bribed a captain to land a shipload of opposition voters from London in Norway instead of Berwick, but in 1757 by a complicated arrangement with Potter and Pitt, which was made to cost him the absurd sum of £7,000, he was elected M.P. for Aylesbury. In 1762, with the aid of Churchill and the countenance of Temple, he began to publish the *North Briton*. The wit and virulence of its attacks on Lord Bute, the Tory favourite of the King, silenced the *Auditor* and *Briton*, the ministerial papers, and were chiefly responsible for the wave of indignation which carried Bute from office on Mar. 8, 1763. Wilkes then held his hand, but when Pitt and Temple read an advance copy of the King's speech sent to them by George Grenville, the new Premier, they decided that Grenville's ministry was no more than a camouflage of the same autocratic power, and encouraged Wilkes to publish (April 23) the famous "No. 45" of the *North Briton*, which was a devastating attack on the statements in the King's speech, which he described as false. Though he had carefully prefaced his attack by the remark "the King's speech has always been considered by the legislature and by the public at large as the speech of the Minister," George III. chose to consider Wilkes' article as a personal insult, and instigated immediate proceedings. A "general warrant" (one that did not name the persons to be arrested) was issued over the signatures of Lords Halifax and Egremont, secretaries of State, and 48 persons were seized by the authorities before Wilkes was arrested (April 30). He was thrown into the Tower and for a short while kept in the closest confinement. To the public delight, however, Lord Chief Justice Pratt on May 6 released Wilkes on the ground that his arrest was a breach of privilege. Actions against Under-Secretary Woods (who was fined £1,000), against Halifax (who by repeated evasions adjourned the case till 1769 when he was fined £4,000), and against minor agents, established the illegality of general warrants.

A second attack was now more carefully prepared by Wilkes' one-time friend Sandwich, now a member of the Government. By bribery and theft P. Carteret Webb, an under-secretary, secured from Wilkes' private press the proofsheets of an obscene parody written by himself and Potter years before on Pope's *Essay on Man*, called the *Essay on Woman*. Wilkes had commenced, but never completed printing twelve copies of this, probably for the Medmenham monks. This disgusting work, together with notes purporting to be by the Bishop of Gloucester, was read aloud with relish on Nov. 15 by Sandwich to the Lords, who voted it a libel and a breach of privilege. The Commons at the same time declared "No. 45" a seditious libel. To face the forthcoming trial before Lord Mansfield after these pronouncements would have been extremely hazardous. Wilkes, who had been gravely wounded in a duel with Samuel Martin, M.P., one of the vehicles of government bribery, withdrew to Paris, and

sent to the Speaker (Jan. 11, 1764), when a motion for his expulsion was brought forward, a certificate of his ill-health. The Speaker declared that this certificate was not sufficiently authenticated, and though triple authentication was forthwith provided, Wilkes was expelled (Jan. 19). In these circumstances, Wilkes, who believed that life sentence would be pronounced against him, decided not to stand his trial and was consequently outlawed (Nov. 1). He spent the next four years on the Continent, chiefly in "amorous delights." The fall of Grenville in 1765 and the accession of the Whigs to power under Rockingham and then Grafton led him to believe that a pardon would be granted to him and his services rewarded by some honourable place. He only slowly realized that none of the Whigs were prepared to risk the King's displeasure for his sake and that the various offers privately made to him were only intended to keep him amused. When he discovered the truth he was extremely bitter against Chatham and Grafton, those chiefly responsible, and pilloried them in a *Letter to the Duke of Grafton,* one of his ablest performances.

In 1768 he decided to risk all by a bold stroke, crossed to London, and announced his candidature, first for London (where he was not elected) and then for Middlesex, where he was chosen M.P. by a heavy majority (Mar. 28). He then surrendered to his outlawry and was sentenced to the comparatively light penalty of £500 fine and a year's imprisonment, each, for the *Essay on Woman* and "No. 45." His popularity was immense, and crowds regularly assembled outside the prison gates (St. George's Fields). On May 10 a riotous crowd was dispersed with bloodshed and loss of life by Scottish soldiery, who were congratulated by the Government. Wilkes published the government instructions which had led to this, with some bitter comments, in the *St. James' Chronicle;* he also presented to the Commons a petition raising the whole question of the illegality of the proceedings against him. (Subsequent investigations show that in the case of the *Essay* these included actual forgery.) He had ignored private promises that he would be left undisturbed if he remained quiet; he reaped the reward of his temerity (Feb. 4, 1769) by being expelled again from the House of Commons, this time with hardly a shred of excuse. He now, by his resentment of a patronizing defence by George Grenville, lost his last wealthy patron (Temple) and was nearly £20,000 in debt. But the arbitrary proceedings of the ministry (instigated by the King) brought him power and, through the subscriptions of wealthy admirers to a "Society of the Supporters of the Bill of Rights," even solvency. He was immediately (Feb. 16) re-elected by the Middlesex electors and once more expelled. Again he was elected (Mar. 16) and again expelled. The Court then secured a bravo named Colonel H. L. Luttrell to stand against Wilkes at the next election (April 13); the figures were Wilkes 1,143, Luttrell 296; but the enraged Commons declared that Luttrell ought to have been elected and actually seated him for Middlesex.

These audacious proceedings had stirred up tremendous excitement in which for the first time for years the artisans and lower middle class felt acutely their disfranchisement. "One of your supporters has turned his coat," Wilkes was told. "Impossible, not one has a coat to turn," he answered. They avenged themselves by rioting and strikes, by scrawling "45" on every door and forcing the court followers to cheer for "Wilkes and Liberty." More effectively, Serjeant Glynn, his colleague for Middlesex, and after his release Wilkes himself, organized, by the medium of public meetings, support from the electors as far distant as Truro, for a "Wilkite" programme which till about 1780 was the standard of a political party. Its chief points were the radical reform of Parliament (to include enfranchisement of the "lower orders" and the suppression of rotten boroughs) and the protection of individual liberty against Ministerial or Parliamentary attack. Wilkes also entered into relations, not fully explored yet, with the American malcontents and seems to have acted as an inspirer of their subsequent action and as English representative of the Boston "Sons of Liberty." His greatest successes, however, were won in the City of London where he triumphantly fought his way through to the Lord Mayoralty in 1774. As Sheriff and Alderman he had welded the powerful City interests with a single block of opposition to the Court and Ministry, achieving his most remarkable victory in the Wheble case, when the City's judicial powers were successfully used to prevent the arrest of printers who reported the House of Commons debates. After the election of 1774, when the Court no longer found it wise to prevent him taking his seat in Parliament, he had a "tail" of about a dozen M.P.'s. He presented (1776) a bill for the radical reform of Parliament. During the American Revolution Wilkes championed the colonial cause. He delivered, in the House of Commons, ten set speeches in which he advocated the immediate cessation of hostilities with America. Lord Shelburne, in concert with John Horne (*see* TOOKE, JOHN HORNE) was able to shake his influence for a short while in the City, but Wilkes more than recovered his position, and in 1779 he was elected Chamberlain of the City, a lucrative office which he filled with absolute scrupulousness till his death. But the violence of his popularity was necessarily waning when in 1780 the Gordon riots broke out (*see* GORDON, LORD GEORGE). Wilkes, despite his turbulence, had never encouraged mob violence, and religious persecution he had always fought. Though all the "lower orders" and even such old allies as Alderman Frederick Bull were deeply implicated in the burning and looting, Wilkes hesitated only a day or two before he practically took matters out of the hands of the complaisant city authorities, secured a draft of troops, and took a prominent part in crushing the disturbance. His own supporters he had to jail—in one case committing his printer Moore for an attack on the house of the judge, Mansfield, who had condemned him.

From this moment, honourable though his motives were, his political career was made impossible. He could no longer drive the rich London merchants and the lower orders in harness together. He had broken violently with the latter and with his own principles (for six years before he had replied to Horne, not necessarily insincerely, that he really believed the voice of the people, when he could ascertain it, to be "the voice of God") and the former had therefore less need for his services. Moreover, they and all well-to-do reformers were attracted by the more respectable reform movement started in the previous year by the Yorkshire M.P.'s. This, based on Rockingham's "Oeconomical reform," substituted triennial for annual Parliaments and the addition of 100 M.P.'s to London and the counties for universal suffrage and redistribution of seats; it was rapidly adopted by a dozen or more counties at general meetings of electors.

Wilkes' energies declined as did his popularity. After he had secured (May 3, 1782) the expunging from the Commons of all record of his expulsions he took little part in politics. In 1790 he did not seek re-election, but retired into private life, dying in 1797. Characteristically enough, he was found to be insolvent, but quite unaware of the fact. An obelisk in Ludgate Circus commemorates him.

Wilkes was above the middle height, exceedingly ugly, with a startling squint that is given all its value in Hogarth's celebrated cartoon, but with a charm of manner and wit which few could resist. Some of his jests have passed into history—as for example his rejoinder to an elector who answered his canvass by saying he would sooner vote for the Devil than Wilkes: "And if your friend is not standing?" To an offer of snuff he answered, "No thank you, I have no *small* vices." To Sandwich, who told him he would either die on the gallows or of venereal disease, "That depends, my lord, on whether I embrace your principles or your mistress." His character, largely through his own fault, has been subject to exaggerated attacks which may be generally traced to Lord Brougham (*see* BROUGHAM AND VAUX, LORD) or to Horace Walpole, whom he was unwise enough to offend. His conversation was indecent, he was entirely incapable of continence in regard to women, though temperate in other ways, and like almost every other public man of his century, he was extravagant. His cynical tongue ruined his reputation with the Victorians: he never did a good thing without giving a bad reason. But dishonesty, cruelty, cowardice or hypocrisy were unknown to him; public money passed untouched through his hands when he was "in want of a guinea"; his political principles were honestly and to all appearances firmly held up till the deadlock of the Gordon riots, de-

scribed above. He secured the great reforms of the abolition of general warrants, the freeing of the press and freedom of choice for the electors; his non-success in securing Parliamentary reform or justice for America can hardly be counted against him.

BIBLIOGRAPHY.—Horace Bleackley, *John Wilkes* (1917, bibl.); Wilkes' papers: Brit. Mus. Add. MSS. 30,865–96 and Guildhall MSS. 212–4; the *Correspondence of J. Wilkes* was edited by Almon (1805) and by Rough (1804). (R. W. P.)

WILKES-BARRE (pronounced *Wilkes-Barré*), a mining city of north-eastern Pennsylvania, U.S.A., on Federal highway 11 and the east bank of the Susquehanna river, 100 m. N.N.W. of Philadelphia and 15 m. S.W. of Scranton. It is served by the Central of New Jersey, the Delaware and Hudson, the Lehigh Valley, the Pennsylvania and two electric railways, and by several motor-bus and truck lines. Pop. (1920) 73,833 (20% foreign-born white); 1928 local estimate 91,900. Within reach of the city by one car fare is a population of 175,000. The city lies in the Wyoming valley and is in the heart of the anthracite region. It is a manufacturing and commercial centre of importance. The assessed valuation for 1927 was $112,926,819. Wilkes-Barre is a compact, substantially built city, with 500 ac. in public parks, large business blocks, wide shaded residential streets, modern school buildings and a large athletic field. The output of Luzerne county in 1926 was 29,872,800 long tons (35% of all the anthracite mined) and its value was more than three times as great as the value of all the gold mined in the country that year. The city has a large trade in coal-mine and railroad supplies. Its manufactures (which include iron and steel, silk goods and other textiles, copper wire, locomotives, electrical goods and many kinds of machinery) were valued in 1925 at $31,172,758. Bank debits in 1927 aggregated $586,586,000.

Wilkes-Barre was settled in 1769 by colonists from New England under the leadership of Maj. John Durkee, on a grant from the Susquehanna Land Company of Connecticut. Maj. Durkee gave the town its name, in honour of John Wilkes and Col. Isaac Barré, stout defenders of the American Colonies in parliament. Ft. Wilkes-Barre was built in 1776 as a defence against Indian invasion. On July 4, 1778, the day after the Battle of Wyoming, Wilkes-Barre was burned by the Indians and British Rangers; and again in July 1784, during the "Second Pennamite-Yankee War," 23 of its 26 buildings were burned. The conflicting claims of Pennsylvania and Connecticut were finally adjusted (*see* WYOMING VALLEY) and the titles of the settlers were confirmed by Pennsylvania in a series of statutes passed in 1799, 1802 and 1807. Wilkes-Barre was incorporated as a borough in 1818 and was chartered as a city in 1871.

WILKIE, SIR DAVID (1785–1841) knighted 1836, Scottish painter, was born on Nov. 18, 1785, the son of the parish minister of Cults, Fifeshire. In 1799 he began to study painting at the Trustees' Academy, Edinburgh. He was much influenced at that time by the work of Carse and David Allan, who painted scenes from humble life, and he haunted fairs and markets with his sketch-book to collect material for similar subjects. In 1805 he went to London, where he entered the Royal Academy schools. His "Village Politicians" and "Blind Fiddler" (commissioned by Sir George Beaumont), were exhibited at the Royal Academy in 1806 and 1807. In 1809 Wilkie was elected A.R.A. and two years later R.A.

In 1830 he succeeded Lawrence as painter in ordinary to the king and from this time onward received many commissions to paint the portraits of royal and other distinguished personages. These were not flattering to their subjects, however, and the female portraits in particular rarely gave satisfaction. His great popularity was due to his genre painting the technique of which he had acquired by a careful study of Teniers, Ostade, and the Dutch masters. Most of his pictures in this category belong to his earlier period, and are distinguished by detailed handling, precision of touch and somewhat subdued colouring, while the pathos of their homely subjects makes a purely sentimental appeal. He died and was buried at sea, off Gibraltar, on June 1, 1841.

His genre pictures include: "Card-Players," "Rent Day" (1807), "The Penny Wedding," the "Village Festival" and "Blind Man's Buff" (National Gallery), "Distraining for Rent," the "Chelsea Pensioners," the "Highland Whisky Still," the "Rabbit on the Wall" and "Reading a Will" (New Pinakothek, Munich). His best portraits are those of "Sir Walter Scott and his family" and "Sir Robert Liston" (cabinet size) and the gallery portrait of Lord Kellie (town hall, Cupar).

A *Life of Sir David Wilkie*, by Allan Cunningham, containing the painter's journals and his "Critical Remarks on Works of Art," was published in 1843.

WILKINS, SIR GEORGE HUBERT (1888–), British explorer, was born at Mt. Bryan East, South Australia, on Oct. 31, 1888. He studied engineering at the Adelaide School of Mines, learned flying in 1910 and became an aeronautical photographer. As photographer he joined the Arctic expedition, 1913–18, of Vilhjalmar Stefansson (*q.v.*), and though he lost his equipment with the sinking of the "Karluk," he stayed on until 1917 and became second in command. In 1917 he enlisted in the Australian Flying Corps, was promoted to captain and decorated for bravery. Later he commanded the photographic section of the Australian forces in France. He was second in command of the British Imperial Antarctic Expedition, 1920–21, and naturalist on the last Antarctic expedition, 1921–22, of Sir Ernest Shackleton (*q.v.*). He led a scientific expedition of the British Museum in tropical Australia, 1923–25, which he records in *Undiscovered Australia* (1928). In 1926 he made his first trip to Point Barrow, Alaska, intending to fly across the Arctic regions, but he could not lift his heavy three-motored plane off the ground. In 1927 he was again at Point Barrow and made a flight 520 m. northwest across a portion of the Arctic ocean previously unexplored, landing and taking off from the ocean ice twice, and making soundings which proved the ocean in this region to be about 3 m. deep. In 1928 Wilkins was back at Point Barrow for a third time and on April 21, with Lieutenant Carl Ben Eilson as pilot, he flew 2,100 m. to Spitsbergen in 20½ hours, covering a route just north of the Canadian Arctic Archipelago and Greenland. With good visibility the flight greatly reduced the unexplored area, but no land was found. The experience is told in *Flying the Arctic* (1928). For this feat, an example of remarkable navigation because of difficult magnetic variations and the constantly changing angles at which longitudinal lines were crossed, Wilkins was created a baronet by King George. In the autumn Wilkins left for the Antarctic and with Eilson on Dec. 19 took off from their base on Deception island and flew 600 m. south across Graham Land. On this flight he discovered several new islands and also discovered that Graham Land itself consisted of two large islands, the southernmost separated from the Antarctic continent by an ice-filled strait 40 to 50 m. wide.

WILKINS, MARY ELEANOR: *see* FREEMAN, MARY ELEANOR WILKINS.

WILKINSBURG, a borough of Allegheny county, Pennsylvania, U.S.A., on the Pennsylvania railroad, adjoining Pittsburgh on the east. Pop. (1920) 24,403 (89% native white); 1928 local estimate 33,000. It is a residential suburb, with little manufacturing. Wilkinsburg was settled in 1798; was first called McNairville and later Rippeyville; and about 1840 was renamed in honour of William Wilkins, then a representative in Congress. It was incorporated as a borough in 1887.

WILKINSON, JAMES (1757–1825), American soldier and adventurer, was born in Calvert county (Md.), in 1757. At the outbreak of the War of Independence he entered the American Army. He served with General Benedict Arnold in the Quebec campaign and was later under General Horatio Gates from May 1777 to March 1778 as adjutant general.

In 1784 Wilkinson settled near the Falls of the Ohio, Louisville, where he became a merchant, farmer and man of influence. He took an active part in the movement for separate statehood for Kentucky, and in 1787 took an oath of allegiance to Spain and began to intrigue with his fellow Kentuckians to detach the western settlements from the Union and bring them under the influence of the Louisiana authorities. His commercial connections at New Orleans enabled him to hold out the lure of a ready market there for Kentucky products. He neutralized the intrigues of British agents then working in Kentucky. For these various services he received until 1800 a substantial pension from the Spanish authorities, being officially known as "Number Thir-

teen." At the same time he worked actively against the Spanish authorities, especially through Philip Nolan. Wilkinson's ventures were not so lucrative as he hoped for, and in Oct. 1791 he was given a lieut. colonel's commission in the regular army, possibly to keep him out of mischief. In 1803 Wilkinson was one of the commissioners to receive Louisiana from France, and in 1805 became governor of that portion of the Purchase above the 33rd parallel, with headquarters at St. Louis. In his double capacity as governor of the territory and commanding officer of the army, reasonably certain of his hold on Jefferson, and favourably situated upon the frontier remote from the centre of government, he attempted to realize his ambition to conquer the Mexican provinces of Spain. For this purpose in 1805 he entered into an agreement with Aaron Burr, and in 1806 sent Z. M. Pike to explore the most favourable route for the conquest of the south-west. Before his agent returned, however, he had betrayed his colleague's plans to Jefferson, formed the Neutral Ground Agreement with the Spanish commander of the Texas frontier, placed New Orleans under martial law, and apprehended Burr and some of his alleged accomplices. In the ensuing trial at Richmond, the prisoners were released for lack of sufficient evidence, and Wilkinson himself emerged with a much damaged reputation. He was then subjected to a series of courts-martial and congressional investigations, but succeeded so well in hiding traces of his duplicity that in 1812 he resumed his military command at New Orleans, and in 1813 was promoted to the rank of major general and took possession of Mobile. Later in this year, by making a miserable fiasco of the campaign against Montreal, he finally brought his military career to a dishonourable end. He died at Mexico City on Dec. 28, 1825.

See Wilkinson's *Memoirs of My Own Time* (1816), untrustworthy and to be used with caution; W. R. Shepherd, "Wilkinson and the Beginning of the Spanish Conspiracy" in *American Historical Review*, vol. ix. (1904); Bemis, *Pinckney's Treaty* (1926). (I. J. C.)

WILKINSON, JOHN (1728–1808), "the great Staffordshire iron-master," was born at Clifton, Cumberland, where his father was overlooker in an iron furnace. A box-iron, patented by his father, but said to have been invented by the son, which helped laundresses to gratify the frilled taste of the dandies of the day, was the beginning of their fortunes. This they made at Blackbarrow, near Furness. When he was about twenty, John moved to Staffordshire, and built, at Bilston, the first furnace there, and, after many experiments, succeeded in utilizing coal instead of wood-charcoal in the puddling and smelting of iron. The father, who now had works at Bersham, near Chester, was again joined by his son, who constructed a new boring machine, of an accuracy heretofore unequalled. James Watt found that the work of this machine exactly filled his requirements for his "fire-engine" for cylinders bored with greater precision. Wilkinson, who by this time owned the Bersham works, now started the manufacture of wrought iron on a large scale at Broseley, and used the first steam-engine made by Boulton and Watt to blow the bellows there. His neighbours in the business, who were contemplating installing Newcomen engines, waited to see how the Wilkinson steam-engine would work. Great care was taken in its manufacture, and Watt himself set it up early in 1776. Its success made the reputation of Boulton and Watt in the Midland counties. Wilkinson now found he had the power alike for the nicest and for the most stupendous operations. The steam cylinder suggested to him the plan of producing blast now in use. He was near coal; he surrounded himself with capable men, whom he fully trusted; he made a good article, and soon obtained large orders. In 1786 he was making 32-pounders, howitzers, swivels, mortars and shells for the government. The difficulty of getting barges to carry his war material down the Severn led him, in 1787, to construct the first iron barge—creating a wonderful sensation among owners and builders. Wilkinson taught the French the art of boring cannon from the solid, and cast all the tubes, cylinders and iron work required for the Paris water-works, the most formidable undertaking of the day. He also erected, in connection with these works, the first steam-engine in France.

Wilkinson also designed and cast the first iron bridge, which connected Broseley and Madeley, across the Severn. He died on July 14, 1808.

WILKINSON (WYLKYNSON), ROBERT, English composer of church music of the 15th and early 16th centuries. Great interest attaches to the four works by him found in an early 16th century ms. in Eton College library. These are: two Salve Reginas for 9 and 5 voices respectively; an imperfect *O Virgo prudentissima,* and a marvellous 13-part canon, which is a setting of the Apostle's Creed preceded by the words *Jesu autem transiens,* which serve as a title. Each of the 13 parts is assigned to an apostle (by name) and the key to the canon is supplied by a Latin note. This impersonation of individual parts would seem to have been a favourite device with him, for in the 9-part *Salve* the voices represent the various angelic hierarchies.

See Grove, *Dictionary of Music and Musicians,* ed. iii.

WILL, in psychology, is sometimes used as synonymous with conation (*q.v.*), but more usually in the restricted sense of deliberate decision, as contrasted with mere impulse (*q.v.*) or desire. In an act of will there is a deliberate choice of one of several alternatives, and frequently a conscious reference to the interests of the subject's self as a whole. People sometimes speak as though the will were a kind of independent entity or faculty which makes the decisions, etc. But that is only a loose way of talking. As Spinoza and Locke pointed out long ago, there is no will apart from particular acts or processes of willing; and it is not the will that wills but the whole self that does it. Similarly with the related hypostasis of "will-power" or "strength of will." There is no strong "will," but there are strong-willed characters, that is, people who can pursue distant ends (good or bad) with great perseverance; weak-willed people, on the other hand, are easily influenced and carried away by every instinct or impulse or desire that prompts them from time to time, and cannot subordinate them to the pursuit of remote ends. For the problem of the freedom of the will *see* FREE-WILL. *See* also PSYCHOLOGY, and the bibliography given there.

WILL or **TESTAMENT,** the legal documentary instrument by which a person regulates the rights of others over his property or family after his death. In strictness "will" is a general term whilst "testament" applies only to dispositions of personalty; but this distinction is seldom observed. The legal power of disposition of one's property by will is more nearly absolute in England than in any other country. In all systems of law derived from Roman law the power is limited so as to preserve the rights of wives and children to fair shares of a deceased father's estate, and it is not even now quite absolute even in England. This is due partly to custom by which in England property among the wealthier classes is usually settled on the marriage of its owner and all that is reserved to him or her is a power of appointing by will the shares in which the issue of the marriage shall take. But even unsettled property was never absolutely subject to the owner's will. Till the Administration of Estates Act 1925 an owner of an estate in fee-tail had no testamentary power over it. Another full power of testamentary disposition will probably be limited very shortly. At this moment (1929) a bill is before parliament proposing to give the courts power to modify a will which deals unfairly with the testator's family. Legislation to that effect has been passed in most of the British colonies.

The custom which ultimately developed into the will is recognized in many primitive systems. It is closely connected with ancestor worship and the continuance, for that purpose, of the family. When a citizen was without descendants ancient law allowed him to continue his family by adopting another person's child as his own. Later, as ancestor worship became more or less obsolete, the practice grew up of allowing an owner of property to nominate an heir if he had no descendants. There most legal systems stopped. The Roman lawyers developed the idea until it became the modern power of testament, which has become in England as regards the owner's own property, the power of free disposition by will without regard to the claims of the disposer's wife and children when he has any.

The oldest form of will in Roman law was the patrician will. It simply amounted to the nomination by a sonless patrician of a

haeres whose duty it would be on the death of his nominator to carry on the family rites. The ceremony was performed before the *comitia calata* or assembly of the *agnati* (male relatives) of the nominator, who would be entitled to succeed to his property if he died without an heir and whose consent to the nomination was in consequence at first necessary. This form of will was possible only where the nominator as a member of a *gens* was also a member of the *comitia calata*. Plebeians had no *gens;* and when they wished to share the patrician privilege of nominating the successor to their family and property they had to do so by a sale of the family to the nominees. At first this sale seems to have been an out and out conveyance *inter vivos* of the testator's property, but gradually it became really the appointment of a trustee to carry out the testamentary dispositions of the nominator. It is from this, the plebeian or mancipatory will, as modified by the praetors and the emperors, that the modern will is descended.

In English Law.—Whether among the customs of the Teutonic tribes or the Anglo-Saxons, there was anything akin to our law of testamentary disposition of property is very doubtful. Tacitus says definitely that there was not. Maitland says that there was, and that it took the form of disposing of the use of property. There appears undoubtedly to have been a proceeding much on the same lines as the patrician will by which a man without lineal descendants might nominate a male child to continue his family; but this is rather adoption than testation, and adoption was a very wide-spread custom in ancient times.

There are reasons to suppose that that proceeding was the only process approaching an act of testation which the Anglo-Saxons brought to England. But we must remember that England had been a Roman province subject to Roman law for centuries before the Anglo-Saxons arrived. It is, therefore, quite possible that after their arrival the Roman law of wills continued to be observed as a special custom in many highly Romanized districts. That, however, there was any general law of wills in a country which was still in the main a congeries of semi-barbarous tribes each with its own primitive customs is frankly incredible. The Norman Conquest altered all that and rapidly turned the Anglo-Saxon tribes into the English nation. The general law of wills dates from the Plantagenets.

After the Norman Conquest there were two great forces which shaped English law. The first was the barons; the second the priests. The first stood for barbaric custom; the second for Roman law. The first fiercely insisted that barbaric custom should control the ownership of land, which belonged chiefly to them. The second contrived to get Roman law applied to goods and chattels which belonged chiefly to their friends, the farmers and townsmen. Hence arose the artificial distinction between real and personal property. The history of later English law is simply a narrative of the struggles between the law of realty and the law of personalty which seems now to have ended in the definite victory of the law of personalty. Since 1925 the whole feudal conception of land owning may be said to have disappeared, as many of its incidents had done generations ago.

So far as wills are concerned the difference between the law of realty and the law of personalty was this: realty could not be disposed of (technically *devised*) by the will of its owner, while the owner of personalty could dispose of (technically *bequeath*) it subject to limitations somewhat similar to the limitations on the Roman power of testation. Thus, if he left behind him a widow and children the testator could dispose freely only of a third part of it. The common law estates in land which were not devisable were *fees simple, fees conditional* (after the Statute *de Donis Conditionalibus*, 1225, turned into *fees tail*) and *life estates*. Later, other interests in land were recognized by the law such as leases for years; but these were not treated as parts of the common law ownership of land but merely hirings of it and as such personalty and bequeathable by will.

The chancellor who was a priest could not make these common law estates devisable but he invented a system under which the beneficial interests in them could be freely disposed of by the owner's will. All the owner had to do was to convey by livery of seisin (or in the case of fees tail by fine or recovery) the common law estate to a friend to hold in trust for (or as the original phrase was *to the use of*) the owner's will. When this was done then on the death of the owner the trustee (or *feofee to uses* as he was called) was compelled by the chancellor to allow the persons for whom the deceased owner directed the use or benefits of the land to go to receive the rents and profits.

This state of the law continued till Henry VIII. in 1538 forced through parliament the Statute of Uses, so called because it abolished uses. At that time England was as Shakespeare described it, a "many slotted land." In other words, it was the age of small landowners, which intervened between the fall of the ancient landowning aristocracy through the Wars of the Roses and the rise of the modern landowning aristocracy through the confiscation of the lands of the priests and the commons of the people. These small landowners resented furiously the deprivation of their right to provide for their younger children out of the only property they possessed and accordingly Henry found it advisable to have another act passed restoring this privilege. The Statute of Wills 1540 allowed owners in fee-simple holding under tenure of common socage to devise all, and those holding under military tenure to devise two-thirds, of their land. By the Military Tenures Act 1662, military tenures were abolished and so fees simple became fully devisable.

But neither act enabled a tenant in fee-tail and a tenant *pur autre vie—i.e.,* for the life of another person than the tenant himself—to devise his estate. The Statute of Frauds made estates *pur autre vie* devisable. Fees tail did not become devisable till the year 1926 (Law of Property Act 1925).

The restrictions on the right to bequeath personalty gradually had become obsolete except in some places where they survived as local customs. The Wills Act 1837 abolished all such customs.

Form of Wills.—From very early times a will of personalty was valid if it was declared by word of mouth of the testator before witnesses (this was called a *nuncupative* will) or, though unwitnessed, if it was all written by the testator in his own hand (this was called a *holograph* will). Uses of land could be devised in the same way. So far as land was concerned, when the Statute of Wills made the legal fee-simple devisable it enacted that the will devising it must be signed by the testator in the presence of three credible witnesses and the courts held that a witness was not credible if he or his wife took any benefit under the will. Later it was enacted that such a witness was credible but the gift was bad. The Statute of Frauds also introduced certain conditions as to the forms of wills of beneficial interests in land and nuncupatory wills of personalty. Finally the Wills Act 1837 decreed that every will of property, whether such property was realty or personalty and whether it was legal or equitable, must be made in the same way, *i.e.*, it must be in writing signed by the testator in the presence of two witnesses, both being present at the same time, who in the presence of the testator are to sign the will as witnesses. Usually the witnesses also sign in the presence of each other but this is not strictly necessary and is only done for greater safety. (*See* further PROBATE.)

The acts of 1925 and 1926 have affected the law of wills to a very small extent. The most important alteration made by them has been the turning of executors into universal successors. For centuries executors as such had nothing to do with their testator's fees simple. When these were expressly left to them for the payment of the deceased's debts they took not as executors but as devisees; and when fees simple were made liable for the deceased's debts even when not so devised, on the death of the testator, they devolved on the devisee, and to make them liable for debts an action for administration was necessary. That was altered by the Land Transfer Act 1897 which vested in his executors the deceased's legal and equitable estates in freehold, and his equitable fees simple in copyholds. That act, however, did not affect the devolution of fees tail and legal fees simple in copyhold. Now by the Administration of Estates Act 1925 all a testator's estate, whether realty or personalty and whether disposed of by his will or not, including property over which he has by his will exercised a general power of appointment and fees tail which he has dis-

posed of by his will, vests in his executors for the purposes of administration. Accordingly executors may now be taken to occupy the position held by the *haeres* in later Roman law. The whole property, realty and personalty, forms a common fund for the payment of the testator's debts. If the estate is inadequate to pay the deceased's debts in full, then the creditors are to be paid according to the rules prevailing in bankruptcy, whether the estate is administered by the court or by the executors. This provision is accompanied by another which seems inconsistent, namely that the executors have still the right to retain their own debts and prefer the debts of other creditors over debts of equal standing. When the estate is solvent but insufficient to pay all debts and legacies in full, the following is the order in which the assets are liable to be appointed for the payment of debts: (1) Property undisposed of by the will, (2) property left by a residuary gift, (3) property left expressly for the payment of debts, (4) property charged with the payment of debts, (5) property liable to pay pecuniary legacies, (6) property specifically devised or bequeathed, and (7) property appointed under a general power of appointment or estates in fee tail disposed of by the will.

It may just be noted that neither the Land Transfer Act of 1897 nor the Administration of Estates Act of 1925 applies to Ireland. (J. A. St.)

Scotland.—Up to 1868 wills of immovables were not allowed in Scotland. The usual means of obtaining disposition of heritage after death was a trust disposition and settlement by deed *de praesenti,* under which the truster disponed the property to trustees according to the trusts of the settlement, reserving a life interest. Thus something very similar to a testamentary disposition was secured by means resembling those employed in England before the Wills Act of Henry VIII. The main disadvantage of the trust disposition was that it was liable to be overthrown by the heir, who could reduce *ex capite lecti* all voluntary deeds made to his prejudice within 60 days of the death of his ancestor. In 1868 the Titles to Land Consolidation Act made it competent to any owner of lands to settle the succession to the same in the event of death by testamentary or *mortis causa* deeds or writings. In 1871 reduction *ex capite lecti* was abolished. A will of immovables must be executed with the formalities of a deed and registered to give title. The disability of a woman as a witness was removed by the Titles to Land Consolidation Act. As to wills of movables, there are several important points in which they differ from corresponding wills in England, the influence of Roman law being more marked. Males may make a will at 14, females at 12. A nuncupative legacy is good to the amount of £100 Scots (£8 6s. 8d.), and a holograph testament is good without witnesses, but it must be signed by the testator, differing in this from the old English holograph. By the Conveyancing Act 1874 such a will is presumed to have been executed on the date which it bears. Not all movables can be left, as in England. The movable property of the deceased is subject to *jus relictae* and *legitim. See* McLaren, *Wills and Succession,* for the law, and *Judicial Styles* for styles.

France.—The law is mainly contained in ss. 967–1074 of the *Code. Civil.* Wills in France may be of three kinds: (1) *holograph,* which must be wholly written, dated and signed by the testator; (2) made as a *public instrument, i.e.,* received by two notaries before two witnesses or by one notary before four witnesses; this form of will must be dictated by the testator and written by the notary, must be read over to the testator in the presence of the witnesses and must be signed by testator and witnesses; (3) *mystic,* which are signed by the testator, then closed and sealed and delivered by him to a notary before six witnesses; the notary then draws up an account of the proceedings on the instrument which is signed by the testator, notary and witnesses. Legatees and their blood relations to the fourth degree may not be witnesses. Nuncupative wills are not recognized. Soldiers' and sailors' wills are subject to special rules as in most other countries. Full liberty of disposition only exists where the testator has no ascendants or descendants, in other cases his *quantité disponible* is subject to *réserve;* if the testator has one child he may only dispose of half his estate, if two only one-third, if three or more only one-fourth; if he has no descendants but ascendants in both lines he may dispose of half, if ascendants in one line only he may dispose of three-fourths. The full age of testamentary capacity is 21 years, but minors over the age of 16 may dispose by will of half of the estate of which they could dispose had they been of full age. There is no restriction against married women making wills. A contract to dispose of the succession is invalid, s. 791.

The codes of the Latin races in Europe are in general accordance with the French law. (J. Wil.)

United States.—The American colonists brought with them the English common law of wills as modified by the Statute of Wills. Inasmuch as the feudal system was never a part of American institutions many of the feudalistic limitations upon the devolution of real property by will never became part of American law. Statutes have quite generally modified the older law of wills and deal systematically with the whole subject of testation. In Louisiana the right of testation is governed by principles of the French law which have been adopted by the Louisiana code. In other Southern and Western States where the original settlers were of French or Spanish origin, marked traces of the civil law are to be found in their law of wills. By far the greater part of American law, however, is of English origin.

The American statutes governing the making of wills were modelled closely either upon the English Statute of Frauds of 1677 or the English Wills Act of 1837. As the legislation of any particular State falls within the compass of one or the other of these statutes, the formal requisites governing the making of the will vary. The provisions of the Statute of Frauds, validating nuncupative wills of soldiers or sailors or those made in the last illness of the testator, are quite generally in force. In those States where the civil law once obtained, the holographic will or will without witnesses but written in the handwriting of the testator, is recognized. Its validity has also been recognized by statute in about one third of the American States. Besides the foregoing the State of Louisiana recognizes still another form of will, which has been designated as the mystic will. This is a documentary will which, when signed by the testator, is enclosed in a sealed envelope and presented to and subscribed by a notary together with seven witnesses.

Full liberty of disposition is generally accorded a testator. In some States limitations are placed by statute upon the testator's right to dispose of all his property away from his wife and children. Limitations also exist as to the character of the property which may be disposed of by will. Dower rights, homestead property, the wife's distributive share of the personalty, the wife's interest in the community property where the State has created such an institution, are generally excluded. The rule of the Statute of Wills limiting devises of realty to real estate owned at the time of the making of the will and excluding after-acquired realty, has been abrogated. Testamentary capacity has been broadened in accordance with modern conceptions, the incapacity of the married woman being removed. The inability of certain classes of persons to take by will, notably aliens and corporations, has also been generally removed. (*See* Executors and Administrators; Legacy.)

See Page, *Wills* (2d. ed. 1926); Schouler, *Wills* (6th ed. 1923); Rood, *Wills* (2d ed. 1926). (J. M. La.)

WILLARD, EMMA (1787–1876), American educator, born at Berlin, Conn., Feb. 23, 1787. She began teaching at 16 years of age. In 1807 she became principal of a girls' academy at Middlebury, Vt., and in 1814 she opened a boarding school of her own. Her *Plan for Improving Female Education* (1819), first addressed to the New York State Legislature, found favour with Governor Clinton who invited her to move her school to Waterford, N.Y. Two years later (1821) it was moved to Troy as the Troy Female Seminary. In 1830 she travelled abroad for her health and aided in founding a girls' school in Athens, Greece. The proceeds from her *Journal and Letters from France and Great Britain* (1833) were given to this school. After 1838 she spent most of her time lecturing and revising her text-books. In 1845–47 she travelled 8,000 miles throughout the south and west urg-

ing and counseling in educational matters. In 1854, with Henry Barnard, she represented the United States at the World's Educational Convention in London. Her *Ancient Geography* (2nd. ed., 1827); *History of the United States* (1828); *Astronomy* (1853); and *Morals for the Young* (1857) passed through many editions and were widely used as text-books up to the time of her death. She published also a volume of poems, of which the best known is "Rocked in the Cradle of the Deep." Her death occurred at Troy, N.Y., on April 15, 1876. *See* A. Lutz, *Emma Willard* (1929).

WILLARD, FRANCES ELIZABETH (1839–1898), American reformer, was born at Churchville, Monroe county (N.Y.), on Sept. 28, 1839. In 1859 she graduated at the Northwestern Female college at Evanston (Ill.). She then became a teacher, and in 1871–74 she was president and professor of aesthetics of the Woman's college at Evanston, which became part of the Northwestern university in 1873. In 1874 she became corresponding secretary and from 1879 until her death was president of the National Woman's Christian Temperance Union, and from 1883 until her death was president of the World's Woman's Christian Temperance Union. In 1890 she was elected president of the Woman's National Council, which represented nearly all of the women's societies in America. She was one of the founders of *Our Union*, a New York publication in the interests of the National Woman's Christian Temperance Union. She died in New York city on Feb. 18, 1898.

With Mary A. Livermore she edited *A Woman of the Century* (Buffalo [N.Y.], 1893), which includes a sketch of her life; and she pub. *Nineteen Beautiful Years* (1864), a life of her sister; *How to Win: A Book for Girls* (1886); *Glimpses of Fifty Years* (1889); and, in collab. with H. M. Winslow, Mrs. S. J. White and others, *Occupations for Women* (1897). *See* A. A. Gordon, *The Beautiful Life of Frances E. Willard* (Chicago, 1898), with an intro. by Lady Henry Somerset, and W. M. Thayer, *Women Who Win* (1896).

WILLCOCKS, SIR WILLIAM (1852–), British engineer, was born in India and educated at Roorkee college, India. From 1872 to 1897 he was engaged successively in the Indian and Egyptian public works departments. He designed and carried through the Aswan dam in 1898. His most important undertaking, however, was the irrigation of 3,500,000 ac. in Mesopotamia, begun in 1911 at an estimated cost of £26,195,000.

His works include: *Egyptian Irrigation* (1889); *The Irrigation of Mesopotamia* (1905); *From the Garden of Eden to the Crossing of Jordan* (1918).

WILLEMITE, a mineral consisting of zinc orthosilicate, Zn_2SiO_4, crystallizing in the parallel-faced hemihedral class of the rhombohedral system. Crystals have the form of hexagonal prisms terminated by rhombohedral planes: there are distinct cleavages parallel to the prism-faces and to the base. Granular and cleavage masses are of more common occurrence. It varies considerably in colour, being colourless, white, greenish-yellow, apple-green, flesh-red, etc. The hardness is 5½, and the specific gravity 3·9–4·2. A variety containing much manganese replacing zinc is called "troostite." Willemite occurs at Sterling Hill, Sussex county, and Franklin Furnace in New Jersey, where it is associated with other zinc ores (franklinite and zincite) in crystalline limestone. It has been found at only a few other localities, one of which is near Liége, and for this reason the mineral was named after William I. of the Netherlands. Under the influence of radium radiations, willemite fluoresces with a brilliant green colour.

WILLEMS, FLORENT JOSEPH MARIE (1823–1905), Belgian painter, was born at Liége on the 8th of January 1823. He made his debut at the Brussels Salon in 1842 with a "Music Party." Among his most famous works are "The Wedding Dress," "La Fête des grands-parents," "Le Baise-main" (Mme. Cardon's collection, Brussels), "Farewell," "The Arches of the Peace" and "The Widow." He died at Neuilly-sur-Seine on the 23rd of October 1905.

WILLESDEN, an urban district of Middlesex, England, and suburb of London, lying immediately outside the boundary of the county of London (boroughs of Hammersmith and Kensington). Pop. (1921) 165,674. At Domesday the manor of Willesden and Harlesden was held by the canons of St. Paul's. In the 12th century it was formed into eight manors. A shrine or image of St. Mary (Our Lady of Willesden) was in the 15th century an object of pilgrimage, but by the middle of the following century the ceremonies had fallen into abuse, and the shrine was suppressed. Remains of Norman building have been discovered in the church of St. Mary. There are considerable railway works attached to Willesden Junction (L.M.S. railway).

WILLET, a conspicuous North American wading bird (*Catoptrophorus semipalmatus*), about 15 in. long, and to be recognized by its black primaries with a broad white band and white upper tail coverts. The willet breeds as far north as New Jersey and Manitoba, wintering from southern United States south. The western willet (*C. s. inornatus*) is paler and slightly larger.

WILLETT, WILLIAM (1856–1915), British builder, was born at Farnham, Surrey, in Sept. 1856. He made a name for himself in London as a designer of beautiful houses; but his chief claim to fame was his conception and promotion of the system of "daylight saving." Though scoffed at in his lifetime, his idea was taken up and put into practice in 1916. He died at Chislehurst, Kent, on March 4, 1915. (*See* DAYLIGHT SAVING.)

WILLETTE, LEON ADOLPHE (1857–), French painter, illustrator, caricaturist, and lithographer, was born in Chalons-sur-Marne. He studied for four years at the École des Beaux-Arts under Cabanel—a training which gave him a unique position among the graphic humorists of France. Whether comedy or tragedy, dainty triviality or political satire, his work is instinct with the profound sincerity of the artist. He set Pierrot upon a lofty pedestal among the imaginary heroes of France, and established Mimi Pinson, frail, lovable, and essentially good-hearted, in the affections of the nation. Willette is at once the modern Watteau of the pencil, and the exponent of sentiments that move the emotional section of the public. There is charm even in his thrilling apotheosis of the guillotine, and in the introduction into his caricatures of the figure of Death.

The artist was a prolific contributor to the French illustrated press under the pseudonyms "Cémoi," "Pierrot," "Louison," "Bébé," and "Nox," but more often under his own name. He illustrated Mélandri's *Les Pierrots* and *Les Giboullés d'avril*, and has published his own *Pauvre Pierrot* and other works, in which he tells his stories in scenes in the manner of Busch.

WILLIAM (*c.* 1130–*c.* 1190), archbishop of Tyre and chronicler, belonged to a noble French family and was probably born in Palestine about 1130. This, however, is only an inference; unfortunately the chapter (xix. 12) which relates to his early life has been excised or omitted from every extant manuscript of his *Historia*. William was still pursuing his studies in Europe when Amalric I. became king of Jerusalem in 1162, but he returned to Palestine towards the close of 1166, or early in 1167, and was appointed archdeacon of Tyre at the request of Amalric in August 1167. In 1168 he was sent on an embassy, the forerunner of several others, to the emperor Manuel I. at Constantinople, and in 1169, at the time of the disastrous campaign against Damietta, he was obliged to take refuge in Rome from the "unmerited anger" of his archbishop. But he was soon in Palestine again, and about 1170 he was appointed tutor to Amalric's son, Baldwin, afterwards King Baldwin IV. Towards the end of 1174, soon after Baldwin's accession to the throne, he was made chancellor of the kingdom of Jerusalem, an office which he held until 1183, and less than a year later (May 1175) he was consecrated archbishop of Tyre. He was one of those who went to negotiate with Philip I., count of Flanders, in 1177, and in 1179 he was one of the bishops who represented the Latin Church of the East at the Lateran council in Rome. On his return to Palestine he stayed seven months at Constantinople with Manuel. This is William's last appearance in history, but he was writing his history in 1181, and this breaks off abruptly at the end of 1183 or early in 1184. He died probably between 1187 and 1190.

William of Tyre is among the greatest of mediaeval historians. His *Historia rerum in partibus transmarinis gestarum*, or *Historia Hierosolymitana* or *Belli sacri historia* covers the period between 1095 and 1184, and is the main authority for the history of the Latin kingdom of Jerusalem between 1127, where Fulcher of Chartres leaves off, and 1183 or 1184, where Ernoul takes up the narrative. It was translated into French in the 13th century, or

possibly before the end of the 12th, and this translation, known as the *Chronique d'outremer*, or *Livre d'Eracles* or *Livre du conquest*, is quoted by Jean de Joinville, and increased by various continuations, in the standard account of the exploits of the French warriors in the East. William's work consists of twenty-two books and a fragment of another book; it extends from the preaching of the first crusade by Peter the Hermit and Pope Urban II. to the end of 1183 or the beginning of 1184.

As *Belli sacri historia* the *Historia rerum* was first published in 1549 at Basel. More recent editions are in J. P. Migne's *Patrologia Latina*, tome cci., and in the "Recueil des historiens des croisades," *Hist. occid.* i. (Paris, 1844). Manuscripts are in the British Museum, London, and in Corpus Christi College, Cambridge. It has been translated into German by E. and R. Kausler (Stuttgart, 1848); into French in Guizot's *Collection des mémoires*, tomes xvi., xviii. (Paris, 1824); into Italian and into Spanish. An English translation has been made for the Early English Text Society by M. N. Colvin (London, 1893). *See* the *Histoire littéraire de la France*, tome xiv. (1869); B. Kugler, *Studien zur Geschichte des zweiten Kreuzzuges* (Stuttgart, 1866); H. Prutz, *Studien über Wilhelm von Tyrus* (Hanover, 1883); and H. von Sybel, *Geschichte des ersten Kreuzzuges* (Leipzig, 1881).

WILLIAM I. (1027 or 1028–1087), king of England, surnamed the Conquerer, was born in 1027 or 1028. He was the bastard son of Robert the Devil, duke of Normandy, by Arletta, the daughter of a tanner at Falaise. In 1034 Robert resolved on a pilgrimage to Jerusalem. Having no legitimate son he induced the Norman barons to acknowledge William as his successor. They kept their engagement when Robert died on his journey (1035), though the young duke-elect was a mere boy. But the next twelve years was a period of the wildest anarchy. Three of William's guardians were murdered; and for some time he was kept in strict concealment by his relatives, who feared that he might experience the same fate. Trained in a hard school, he showed a precocious aptitude for war and government. He was but twenty years old when he stamped out, with the help of his overlord, Henry I. of France, a serious rising in the districts of the Bessin and Cotentin, the object of which was to put in his place his kinsman, Guy of Brionne. Accompanied by King Henry, he met and overthrew the rebels at Val-des-Dunes near Caen (1047). It was by no means his last encounter with Norman traitors, but for the moment the victory gave him an assured position. Next year he joined Henry in attacking their common enemy, Geoffrey Martel, count of Anjou. Geoffrey occupied the border fortress of Alençon with the good will of the inhabitants. But the duke recovered the place after a severe siege, and inflicted a terrible vengeance on the defenders, who had taunted him with his base birth; he also captured the castle of Domfront from the Angevins (1049).

In 1051 the duke visited England, and probably received from his kinsman, Edward the Confessor, a promise of the English succession. Two years later he strengthened the claims which he had thus established by marrying Matilda, a daughter of Baldwin V. of Flanders, who traced her descent in the female line from Alfred the Great. This union took place in defiance of a prohibition which had been promulgated, in 1049, by the papal council of Reims. Pope Nicholas II. at length granted the needful dispensation (1059). By way of penance William and his wife founded the abbeys of St. Stephen and the Holy Trinity at Caen. The political difficulties caused by the marriage were more serious. Alarmed at the close connection of Normandy with Flanders, Henry I. joined forces with Geoffrey Martel in order to crush the duke, and Normandy was twice invaded by the allies. In each case William decided the campaign by a signal victory. The invasion of 1054 was checked by the battle of Mortemer; in 1058 the French rearguard was cut to pieces at Varaville on the Dive, in the act of crossing the stream. Between these two wars William aggrandized his power at the expense of Anjou by annexing Mayenne. Soon after the campaign of Varaville both Henry I. and Geoffrey Martel died. He at once recovered Maine from the Angevins, nominally in the interest of Count Herbert II., on whose death (1062) Maine was formally annexed to Normandy.

Conquest of England.—About 1064 the accidental visit of Harold (*q.v.*) to the Norman court added another link to William's connection. It seems clear that the earl made a promise to support the claims of William upon the English succession. This promise he was invited to fulfil in 1066, after the Confessor's death and his own coronation. William had some difficulty in securing the help of his barons for his proposed invasion of England; it was necessary to convince them individually by threats and persuasions. Otherwise conditions were favourable. William secured the benevolent neutrality of the emperor Henry IV.; and the expedition had the solemn approval of Pope Alexander II. With Tostig, the banished brother of Harold, William formed a useful alliance; the duke and his Normans were enabled, by Tostig's invasion of northern England, to land unmolested at Pevensey on Sept. 28, 1066. On the 14th of October a crushing defeat was inflicted on Harold at the battle of Senlac or Hastings; and on Christmas Day William was crowned at Westminster.

Five years more were to elapse before he became master of the west and north. Early in 1067 he made a progress through parts of the south, receiving submissions, disposing of the lands of those who had fought against him, and ordering castles to be built; he then crossed the Channel to celebrate his triumph in Normandy. Disturbances at once occurred in Northumbria, on the Welsh marches and in Kent; and he was compelled to return in December. The year 1068 was spent in military expeditions against Exeter and York, in both of which the adherents of Harold had found a welcome. In 1069 Robert of Comines, a Norman to whom William had given the earldom of Northumberland, was murdered by the English at Durham; the north declared for Edgar Atheling, the last male representative of the West-Saxon dynasty; and Sweyn Estrithson of Denmark sent a fleet to aid the rebels. Joining forces, the Danes and English captured York, although it was defended by two Norman castles. Marching rapidly on York William drove the Danes to their ships; and the city was then reduced by a blockade. The king ravaged the country as far north as Durham with such completeness that traces of devastation were still to be seen sixty years later. But the English leaders were treated with politic clemency, and the Danish leader, Jarl Osbiorn, was bribed to withdraw his fleet. Early in 1070 the reduction of the north was completed by a march over the moors to Chester, which was now placed under an earl of William's choice. From this point we hear no more of general rebellions against the foreign rule.

Administration.—Of the measures which William took to consolidate his authority we have many details; but the chronological order of his proceedings is obscure. The redistribution of land appears to have proceeded pari passu with the reduction of the country; and at every stage of the conquest each important follower received a new reward. Thus were formed the vast but straggling fiefs which are recorded in Domesday. The great earldoms of the West-Saxon period were allowed to lapse; the new earls, for the most part closely connected with William by the ties of blood or friendship, were lords of single shires; and only on the marches of the kingdom was the whole of the royal jurisdiction delegated to such feudatories. William's writs show that he kept intact the old system of governing through the sheriffs and the courts of shire and hundred. Those whom he enfeoffed with land held it according to the law of Norman feudalism, and were thus brought into close personal relations with the king. But he forced the most powerful of them to acknowledge the jurisdiction of the ancient local courts; and the old fyrd-system was maintained in order that the crown might not be wholly dependent on feudal levies. Though his forest-laws and his heavy taxation caused bitter complaints, William won the respect of his English subjects. They appear to have accepted him as the lawful heir of the Confessor; and they regarded him as their natural protector against feudal oppression. This is to be explained by his regard for legal forms, by his confirmation of the "laws of Edward" and by the support which he received from the church. Domesday Book shows that in his confiscations he can have paid little attention to abstract justice. Almost every English landholder of importance was dispossessed, though only those who had actually borne arms against William

should have been so treated. As far as possible Englishmen were excluded from all responsible positions both in church and state. After 1071 our accounts of William's doings become jejune and disconnected. Much of his attention must have been engrossed by the work of administration, carried on without the help of those elaborate institutions, judicial and financial, which were perfected by Henry I. and Henry II. William had few ministers of note. William Fitz Osbern, earl of Hereford, who had been his right-hand man in Normandy, fell in the civil wars of Flanders (1071). Odo, bishop of Bayeux, William's half-brother, lost favour and was finally thrown into prison on a charge of disloyalty (1082). Another half-brother, Robert of Mortain, earl of Cornwall, showed little capacity. Of the king's sons Robert, though titular count of Maine, was kept in leading strings; and even William Rufus, who was in constant attendance on his father, never held a public office. The Conqueror reposed much confidence in two prelates, Lanfranc of Canterbury and Geoffrey of Coutances. They took an active part in the civil no less than the ecclesiastical government. But the king himself worked hard in hearing lawsuits, in holding councils and ceremonious courts, and finally in conducting military operations.

In 1072 he undertook a campaign against Malcolm, king of Scots, who had married Margaret, the sister of Edgar Atheling, and was inclined to promote English rebellions. When William reached the Forth his adversary submitted, did homage as a vassal, and consented to expel Edgar Atheling, who was subsequently endowed with an English estate and admitted to William's favour. From Scotland the king turned to Maine, which had profited by the troubles of 1069 to expel the Norman garrisons. William had no difficulty in reducing the country, even though Le Mans was assisted by Fulk of Anjou (1073). A conspiracy of the earls of Hereford and Norfolk, in which the Englishman Waltheof, earl of Northampton, was to some extent implicated, was defeated by Lanfranc in the king's absence; but William returned to settle the difficult question of their punishment, and to stamp out the last sparks of disaffection. The execution of Waltheof, though strictly in accordance with the English law of treason, he only sanctioned after long hesitation, and this severity to a man who was generally thought innocent, is one of the dark stains on his career. In 1076 he invaded Brittany to get possession of the fugitive earl of Norfolk; but Philip of France came to the aid of the Bretons, and William gave way before his suzerain. The next few years were troubled by a quarrel between the king and his eldest son, Robert (*q.v.*). In the years 1083–1085 there was a second rising in Maine. In 1085 news arrived that Cnut the Saint, king of Denmark, was preparing to assert the claims of his house in England. The project fell through, but gave occasion for the famous moot at Salisbury in which William took an oath of direct allegiance from "all the land-sitting men that were in England" (1086).

While the danger was still impending he took in hand (1085) the compilation of Domesday Book (*q.v.*). In 1087 he invaded the French Vexin to retaliate on the garrison of Mantes for raids committed on his territory. He sacked and burned the town. But as he rode out to view the ruins his horse plunged on the burning cinders and inflicted on him an internal injury. He was carried in great suffering to Rouen and there died on Sept. 9, 1087. He was buried in St. Stephen's at Caen. A plain slab still marks the place of his tomb, before the high altar; but his bones were scattered by the Huguenots in 1562.

Character.—In a profligate age William was distinguished by the purity of his married life, by temperate habits and by a sincere piety. His most severe measures were taken in cold blood, as part of his general policy; but his natural disposition was averse to unnecessary bloodshed or cruelty. His one act of wanton devastation, the clearing of the New Forest, has been grossly exaggerated. He was avaricious, but his church policy (*see* article ENGLISH HISTORY) shows a disinterestedness as rare as it was honourable. In personal appearance he was tall and corpulent, of a dignified presence and extremely powerful physique, with a bald forehead, close-cropped hair and short moustaches.

By Matilda (d. 1083), William had four sons, Robert, duke of Normandy, Richard (killed whilst hunting), and the future kings, William II. and Henry I., and five or six daughters, including Adela, who married Stephen, count of Blois.

Of the original authorities the most important are the *Gesta Willelmi*, by William of Poitiers (ed. A. Duchesne in *Historiae Normannorum scriptores*, Paris, 1619); the Winchester, Worcester and Peterborough texts of the *Anglo-Saxon Chronicle* (ed. B. Thorpe, "Rolls" series, 2 vols., 1861, and also C. Plummer, 2 vols., Oxford, 1892–99); William of Malmesbury's *De gestis regum* (ed. W. Stubbs, "Rolls" series, 2 vols., 1887–89); William of Jumièges' *Historia Normannorum* (ed. A. Duchesne, *op. cit.*); Ordericus Vitalis' *Historia ecclesiastica* (ed. A. le Prévost, *Soc. de l'histoire de France*, 5 vols., Paris, 1838–55). Of modern works the most elaborate is E. A. Freeman's *History of the Norman Conquest*, vols. iii.–v. (Oxford, 1870–76). Domesday Book was edited in 1783–1816 by H. Farley and Sir H. Ellis in four volumes. Of commentaries the following are important: *Domesday Studies* (ed. P. E. Dove, 2 vols., 1888–91); J. H. Round, *Feudal England* (1895); F. W. Maitland, *Domesday Book and Beyond* (Cambridge, 1897); P. Vinogradoff, *English Society in the Eleventh Century* (Oxford, 1908). *See* also F. M. Stenton, *William the Conqueror* (1908); R. Francis, *William the Conqueror* (1915); M. de Ranchi, *Apologie pour Guillaume le Conquérant* (1919); S. H. Benton, *From Coronet to Crown* (1926). (H. W. C. D.)

WILLIAM II. (*c.* 1056–1100), king of England, surnamed Rufus, was the third son of William I. by his queen Matilda of Flanders. He seems to have been his father's favourite son, and constantly appears in the Conqueror's company, although like his brothers he was carefully excluded from any share in the government. A squabble with Rufus was the immediate cause of Robert's first rupture with the Conqueror; in the ensuing civil war we find Rufus bearing arms on the royal side (1077–80). On his death-bed the Conqueror was inclined to disinherit his eldest son in favour of Rufus, who by the early death of Prince Richard. was now left second in the order of succession. But Normandy was bequeathed to Robert, while Rufus was designated as king of England. Rufus was crowned at Westminster on Sept. 26, 1087, fifteen days after the death of his father.

Domestic Administration.—In his domestic administration we can trace a certain continuity of purpose, and in his dealings with the Welsh and Scots he proceeded, though intermittently, along the broad lines of policy which his father had marked out. Beyond the Channel he busied himself with schemes, first for the reunion of England and Normandy, then for the aggrandisement of Normandy at the expense of France. But the violence, the irregularity, the shamelessness of his private life are faithfully reflected in his public career. Even in cases where his general purpose could be justified, his methods of execution were crudely conceived, brutal and short-sighted. Rufus was not without valour or glimmerings of chivalry, but perfidious to his equals, oppressive to his subjects, contemptuous of religion; with no sense of his responsibilities, and determined to exact the last farthing of his rights. The baronage took up arms for Robert in the name of the hereditary principle, but with the secret design of substituting a weak and indolent for a ruthless and energetic sovereign. Local risings in Norfolk, Somerset and the Welsh marches were easily repressed. The castles of Kent and Sussex offered a more formidable resistance, since their lords were in direct communication with Robert of Normandy, and were led by the able Odo of Bayeux (*q.v.*), the king's uncle, who had been released from prison at the opening of the reign. Rufus secured the help of the native English, by promises (never fulfilled), of good laws, the abolition of unjust taxes and redress for those who had suffered by the afforestments of the late king. Aided by large contingents of the national militia he subdued the rebels. Odo of Bayeux left England under a safe-conduct to sow fresh seeds of discord in Normandy. But Rufus resolved to take vengeance on his brother, and in 1089 he invaded eastern Normandy. In 1091 a treaty was hastily patched up. Rufus retained the eastern marches of the duchy, and also received certain seaports. In return he undertook to aid Robert in reducing the rebellious county of Maine, and in recovering the Cotentin from their younger brother, Henry Beauclerk, to whom it had been pledged by the impecunious duke. The last part of the agreement was duly executed. Rufus then recrossed the Channel to chastise the Scots, who in his absence had raided the north country. Malcolm III.

of Scotland prudently purchased his withdrawal, by doing homage (Aug. 1091) on the same terms which William I. had imposed in 1072. Next year Rufus broke the treaty by seizing the stronghold of Carlisle and the other lands held or claimed by Malcolm in Cumberland and Westmorland. Malcolm in vain demanded satisfaction; while attempting reprisals on Northumberland he was slain in an obscure skirmish (1093). Rufus immediately put forward a candidate for the vacant throne; and this policy, though at first unsuccessful, finally resulted in the accession of Edgar (1097), a son of Malcolm, who had acknowledged the English overlordship. Carlisle remained an English possession; in the next reign Cumberland and Westmorland appear as shires in the accounts of the Exchequer.

Norman Policy.—Rufus resumed his designs on Normandy at the first opportunity. Robert reproached his brother with non-fulfilment of the terms arranged in 1091; and Rufus seized the excuse for a second invasion of the duchy (1094). But Robert resolved to go upon a crusade and, to obtain the necessary funds, gave Normandy in pledge to his brother (1096). The interests of Normandy at once became the first consideration of Rufus's policy. In 1098–99 he recovered Maine, and commenced operations for the recovery of the Vexin. Early in 1100 he accepted a proposal, made by William IX. of Aquitaine, that he should take over that duchy on terms similar to those arranged in the case of Normandy. Contemporaries were startled at the rapid progress of the king's ambitions, and saw the direct interposition of heaven in the fate which cut them short. On Aug. 2, 1100, Rufus fell, in the New Forest, the victim of an arrow from an unknown hand. The common story names Walter Tirel, who was certainly close at hand and fled the country without venturing to abide the issue of a trial. But a certain Ralph of Aix was also accused; and Tirel, from a safe distance, solemnly protested his innocence.

It remains to notice the main features of the domestic administration which made the names of William and his minister, Ralph Flambard, infamous. We are told that the "moots" all over England were "driven" in the interests of the king; which perhaps means that aids were extorted from the shire-courts. We also learn that the forest-laws were rigorously administered; that the king revived, for certain offences, the death-penalty which his father had abolished; that all men were vexed by unjust gelds and the feudal classes by unscrupulous misinterpretations of the customs relating to the incidents of wardship, marriage and relief. On one occasion the militia were summoned in considerable numbers for a Norman expedition, which was no part of their duty; but when they arrived at the sea-coast they were bidden to hand over their journey money and go home. The incident is not uninstructive as a side-light on the king's finance. As to the oppression of the church we are more fully informed; after allowing for exaggeration there still remains evidence enough to prove that the ecclesiastical policy of Rufus was unscrupulously venal.

In appearance William II. was unattractive; bull-necked, with sloping shoulders, extremely corpulent and awkward in his gait. His long locks and clean-shaven face marked his predilection for the new-fangled fashions which contemporary ecclesiastics were never weary of denouncing. His features were strongly marked and coarse, his eyes grey and deeply set; he owed his nickname to the fiery hue of his complexion. He stuttered violently and in moments of passion was almost inarticulate. His familiar conversation was witty and blasphemous. He was surrounded by a circle of vicious parasites, and no semblance of decorum was maintained in his household. His character was assailed by the darkest rumours which he never attempted to confute. He died unmarried and without issue.

The main authorities for the reign are the *Peterborough Chronicle* (ed. C. Plummer, 2 vols., Oxford, 1892–99); Eadmer's *Vita Anselmi* and *Historia Novorum* (ed. M. Rule, "Rolls" series, 1884); William of Malmesbury's *De gestis regum* (ed. W. Stubbs, "Rolls" series, 2 vols., 1887–89); Orderic Vitalis' *Historia ecclesiastica* (ed. A. le Prévost, 5 vols., Paris, 1838–55). Of modern works the most exhaustive is E. A Freeman's *Reign of William Rufus* (2 vols., Oxford, 1882). *See* also J. H. Round's *Feudal England* (1895).

WILLIAM III. (1650–1702), king of England and prince of Orange, was the only son of William II., prince of Orange, stadtholder of the Dutch republic, and Mary, daughter of Charles I. of England, and was born at The Hague on Nov. 4, 1650, eight days after his father's death. His father had attempted a *coup d'état*, which had failed, with the result that on his death the office of stadtholder was abolished. Power passed into the hands of John de Witt, who represented the oligarchic element and the special interests of one province, Holland, and was taken from the Orange party which represented the more democratic element and the more general interests of the Seven Provinces. William grew up among enemies, and learned to conceal his feeling behind the mask of an immobile, almost repulsive, coldness. Like Charles XII. of Sweden and the younger Pitt, he was a wonderful example of premature mental development.

Stadtholdership.—In 1672 Louis XIV. suddenly invaded Dutch territory. The Dutch people turned for help to the prince of Orange. On July 8, 1672 the states general revived the stadtholderate, and declared William stadtholder, captain-general and admiral for life. This revolution was followed by a riot, in which John de Witt and his brother Cornelius were murdered by the mob at The Hague. Evidence may be sought in vain to connect William with the outrage, but he lavishly rewarded its leaders and promoters. The cold cynicism with which he acted towards de Witt is only matched by the heroic obstinacy with which he confronted Louis. He rejected all thought of surrender and appealed to the last resource of Dutch patriotism by opening the sluices and laying vast tracts under water. The French army could not advance, while the French and English fleets were defeated by the Dutch admiral, De Ruyter. William summoned Brandenburg to his aid (1672) and made treaties with Austria and Spain (1673). In August 1674 he fought his first great battle at Seneffe, where the honours lay with Condé. The French evacuated Dutch territory early in 1674, but continued to hold places on the Rhine and in Flanders. In April 1677 William was badly beaten at St. Omer, but he secured a diplomatic victory by his marriage, in November 1677, with Mary, eldest daughter of James, duke of York, afterwards King James II. He undertook negotiations with England in the following year which forced Louis to make terms and sign the treaty of Nijmwegen in August 1678, which gave Franche Comté and other places in Spanish Flanders to France.

William started a new coalition against Louis in October 1681 by making a treaty with Sweden, and subsequently with the empire, Spain and several German princes. After absorbing Strasbourg (1681), Louis invaded Spanish Flanders and took Luxembourg (1684). Even then the new league would not fight and allowed Louis to retain his conquests by the truce of Regensburg (1685), but none the less these humiliations gave rise to a more closely-knit and aggressive coalition, which was organized in 1686 and known as the League of Augsburg.

The English Crown.—From 1677 onwards William had carefully watched the politics of England. On the accession of James II. in 1685 he forced the duke of Monmouth to leave Holland, and sought to dissuade him from his ill-starred expedition to England. He apparently tried to conciliate his father-in-law in the hope of bringing him into the League of Augsburg. By November 1687 he saw that James would not join the league against Louis, and he turned for support to the English opposition. He caused his chief minister Fagel to write a letter expressing his disapprobation of the religious policy of James, which was published in November 1687. But he made it clear that he would not interfere unless he received a definite invitation. On June 30, 1688 Admiral Herbert, disguised as a blue-jacket, set out from England with a letter from seven influential Englishmen, asking William to "bring over an army and secure the infringed liberties" of England.

William landed at Torbay (Nov. 5, 1688). After a few days of hesitation, many influential noblemen declared for him in different parts of the country. James, who had at first joined his army at Salisbury, fell back to London and tried to negotiate. (For his flight connived at by William, *see* JAMES II.) William, on the advice of an assembly of notables, summoned a convention parliament on Jan. 22, 1689. He was proclaimed joint-sovereign of England in conjunction with his wife, Mary (Feb. 13, 1689).

Internal Administration.—A constitutional settlement was effected by the end of 1689, almost all the disputed points between king and parliament being settled in favour of the latter. Though William by no means appreciated this confinement of his prerogative, he was too wise to oppose it. His own initiative is more clearly traceable in the Toleration Act, extending liberty of private worship to Dissenters. He also secured an Act of Grace and Indemnity in 1690, by which he calmed the violence of party passion. But in general his domestic policy was not very fortunate, and he can hardly claim any personal credit for the reassessment of the land-tax (1692), the creation of the national debt or the recoinage act (1693–1695). Further, he threatened the existence of the Bank of England, by lending his support to a counter-institution, the Land Bank, which ignominiously collapsed. Though he was not blind to the commercial interests of England, he was neglectful of the administration and affairs of her oversea colonies. But though he was unable to extract the best results from parliament he was always able to avert its worst excesses. In spite of strong personal opinions to the contrary, he accepted the Triennial Act (1694), the vote reducing the army to 10,000 men (1697), the vote disbanding his favourite Dutch Guards (1699) and even (November 1699) a bill rescinding the grants of forfeited Irish estates, which he had made to his favourites. The main cause of the humiliations William suffered from parliament lay in his incapacity to understand the party or cabinet system. In his view the best way to govern was to have both parties represented in the ministry, so that, as Whig and Tory fell out, the king came by his own. This method was unsuccessful, and affairs went most smoothly when the parliamentary majority held the same views as the ministry. William possessed an experience of the workings of representative government in Holland, and his mistakes are by no means so pardonable as were, for example, those of the Georges, who had been absolute monarchs in their own country. William's unpopularity with his new people was, on the whole, unjustified, but his memory is rightly darkened by the stain of the "Massacre of Glencoe." In 1692 he signed an order for the "extirpation" of the Macdonalds, a small clan in the vale of Glencoe. It is improbable that he meant his order to be literally executed, it is not certain that he knew they had taken the oath of allegiance to him. None the less, when the massacre was carried out with circumstances of revolting barbarity, William behaved as he had done after the murder of De Witt. Popular pressure forced him to bring the murderers to justice, to punish and dismiss them from his service. But shortly afterwards they were all received into favour; "one became a colonel, another a knight, a third a peer."

These and other actions indicate that William could show on occasion a cold and cynical ruthlessness. The master aim of his life was the restoration of the "Balance of Power," by the overthrow of the predominance of France. This was the real aim of William in going to England in 1688. He had set off to secure an ally against Louis, and he came back from his expedition with a crown on his head and a new nation at his back, united in its detestation of popery and of France.

Foreign Policy.—As king of England he concluded treaties of alliance with the members of the League of Augsburg and sent a large army to oppose the French in Flanders. (For the course of the war on sea and on land, both in Ireland and in Flanders *see* GRAND ALLIANCE, WAR OF.) William had assumed the duties of commander-in-chief too young to learn the full duties of a professional soldier himself, and his imperious will did not suffer others to direct him. Hence though often fertile in resource and ingenious in plan, he was always a brilliant amateur.

In diplomacy William was as uniformly successful as in war he was the reverse. His unity of aim and constancy of purpose make him one of the greatest of modern diplomatists. He held together his ill-assorted coalition, and finally concluded peace at Ryswick in September 1697. Louis restored all his acquisitions since 1678, except Strasbourg, and recognized William as king of England. During the subsequent years William tried to arrange a partition treaty with France, by which the domains of the childless Charles II. of Spain were to be divided at his death. But on the death of Charles in 1700 the whole heritage was left to France. William endeavoured to oppose this, and used Louis's recognition of James Edward the "Old Pretender" as king of England (Sept. 1701) to set the English people in a flame. War was already declared in 1702, but William, who had long been ailing, died from the combined effects of a fall from his horse and a chill on March 8, 1702.

In viewing William's character as a whole one is struck by its entire absence of ostentation, a circumstance which reveals his mind and policy more clearly than would otherwise be the case. He had many faults, both in his public and private life, and both in England and in Holland his domestic administration was criticised. His essential greatness lay in his European policy. The best proof of his real powers of statesmanship is that the peace of Utrecht was subsequently made on the broad lines which he had laid down as the only security for European peace nearly a dozen years before its conclusion. While he lacked in diplomacy the arts of a Louis XIV. or the graces of a Marlborough, he grasped the central problems of his time with more clearness, or advanced solutions with more ultimate success, than any other statesman of his age. Often baffled, but never despairing, William fought on to the end, and the ideas and the spirit of his policy continued to triumph long after the death of their author.

WILLIAM IV. (1765–1837), king of England, third son of George III., was born at Buckingham Palace on Aug. 21, 1765. In 1779 he was sent to sea and became a midshipman under Admiral Digby. Next year he sailed under Rodney and took part in the action off Cape St. Vincent (Jan. 16, 1780). During the rest of the war the young prince saw plenty of service, for which he had a strong liking, and so laid the foundation of his popularity. On the conclusion of the war he travelled in Germany, visiting Hanover and Berlin, where he was entertained by Frederick the Great. In 1785 he passed for lieutenant; next year he was made captain and stationed in the West Indies.

In 1789 he was made duke of Clarence. When war was declared against the French republic in 1793, he could obtain no command. He amused or revenged himself by joining the prince of Wales and the duke of York in their opposition to the king. He took his seat in the House of Lords, where he defended the extravagances of the prince of Wales, spoke on the Divorce Bill, and vehemently opposed the emancipation of slaves. Meanwhile he formed a connection with Mrs. Jordan, the actress, with whom he lived on terms of mutual affection and fidelity for nearly twenty years. The death of Princess Charlotte in 1817 compelled him to break with Mrs. Jordan, and to marry (1818) Adelaide of Saxe-Meiningen, who obtained great influence over her husband. On the death of the duke of York in 1827 the duke of Clarence became heir to the throne, and in the same year he was appointed lord high admiral. He endeavoured to assume independent control of naval affairs, although his patent precluded him from acting without the advice of two members of his council. This involved him in a quarrel with Sir George Cockburn, in which he had to give way. As he still continued to act in defiance of rules, the king was at length obliged to call upon him to resign.

On June 28, 1830 the death of George IV. placed him on the

throne. During the first two years of his reign England underwent an agitation more violent than any from which it had suffered since 1688. William IV. was well-meaning and conscientious; but his timidity and irresolution drove ministers to despair, while his anxiety to avoid extremes and his want of insight into affairs prolonged a dangerous crisis and brought the country to the verge of revolution. The July revolution in France gave a great impulse to the reform movement in England. Within a fortnight of the opening of parliament the Tory ministry were beaten on a motion for the reform of the civil list, and resigned. Lord Grey undertook to form a ministry, with the avowed intention of bringing in a large measure of reform. This was not in itself displeasing to the king, who had liberal tendencies, and a few years before had supported Catholic emancipation. But when the government were beaten in committee, and offered to resign, the king declined to accept their resignation, but at the same time was unwilling to dissolve. He was only forced to it (April 1831) by the action of the opposition. After a protracted political crisis (*see* GREY, CHARLES GREY, 2nd earl) the king was compelled to consent to create a sufficient number of new peers to carry the Second Reform bill, and the threat was successful in bringing about the passing of the act in 1832.

During the rest of his reign William IV. had not much opportunity of active political interference, but on one other occasion he made an unjustifiable use of his prerogative. This was in Nov. 1834 when he suddenly dismissed the Melbourne ministry on a mere pretext, but in reality because he disapproved of their Irish Church policy, and summoned Sir Robert Peel. The formation of the Peel ministry was immediately followed by a dissolution, and, beaten on Lord John Russell's motion respecting the Irish Church (3rd of April, 1835), Peel resigned and Melbourne again came into power. Under him the Whigs retained the lead during the remainder of the reign. This *coup d'état* of Nov. 1834 was the last occasion on which an English sovereign attempted to impose an unpopular ministry on the majority in parliament.

In May 1837 the king began to show signs of debility, and died from an affection of the heart on June 20, leaving behind him the memory of a genial, frank, warm-hearted man, but a blundering, though well-intentioned prince. He was succeeded by his niece Queen Victoria.

WILLIAM I. (1797–1888), king of Prussia and German emperor, second son of Frederick William III. of Prussia and Louise, a princess of Mecklenburg-Strelitz, was born at Berlin on March 22, 1797, and received the names of Wilhelm Friedrich Ludwig. After the battle of Jena he spent three years at Königsberg and Memel. On Jan. 1, 1807 he received an officer's patent, and on Oct. 30, 1813 was appointed a captain. William accompanied his father in the campaign of 1814, and early in 1815, received the iron cross for personal bravery shown at Bar-sur-Aube. He took part in the entry into Paris on March 31, 1814, and afterwards visited London. He joined the Prussian army in the final campaign of the Napoleonic wars, and again entered Paris. He was made a colonel and member of the permanent military commission at 20, a major-general at 21, and commander of a division in 1820. During the following nine years he mastered the Prussian military system and studied closely those of the other European States. In 1825 he was promoted lieutenant-general, and commander of the corps of guards. On June 11, 1829 he married Augusta (d. Jan. 1, 1890), daughter of Charles Frederick, grand duke of Saxe-Weimar, a lady of liberal tendencies and Catholic sympathies, whose considerable influence at court was generally exerted against that of Bismarck. By this lady William had two children: the crown prince Frederick William (b. 1831) who succeeded him as Frederick III. (*q.v.*) and the Princess Louise (b. 1838) who in 1850 married the grand duke of Baden.

On the death of his father in 1840—the new king, Frederick William IV., being childless—Prince William, as heir presumptive to the throne, received the title of prince of Prussia. He was also made lieutenant-governor of Pomerania and appointed a general of infantry. In politics he was decidedly conservative. On the outbreak of the revolution of 1848 he saw that some concessions were necessary, but urged that order should first be restored. Generally held responsible for the bloodshed in Berlin on March 18 (and hence nicknamed the "Cartridge Prince," although actually no longer in command of the guards), William was so hated for his supposed reactionary views that the king entreated him to leave the country for some time. He went to London, where he formed intimate personal relations with the leading English statesmen. Returning to Berlin, on June 8 he took his seat in the Prussian national assembly, and spoke expressing belief in constitutional principles. In 1849 he conducted the army which crushed the revolutionary movement in Baden. At the beginning of the campaign an unsuccessful attempt was made on his life. In Oct. 1849 he was appointed military governor of the Rhineland and Westphalia. In 1854 he was promoted field-marshal and made governor of the fortress of Mainz. On Oct. 7, 1858 he became regent for his brother, succeeding him on Jan. 2, 1861.

The political events of William's regency and reign are told elsewhere. (*See* GERMANY: *History.*) William was not a ruler of the intellectual type of Frederick the Great; but he believed intensely in the "God of battles" and in his own divine right as the viceregent of God so conceived. He believed also in the ultimate union of Germany and in the destiny of Prussia as its instrument; and held that whoever aspired to rule Germany must seize it for himself. But an attitude so alien to the Liberal temper of contemporary Germany was tempered by shrewd common sense, and wisdom in his choice of advisers. Thus as regent he called the Liberals into office on Bismarck's advice, though later he did not hesitate to override the Constitution when parliament refused supplies for the new armaments. From Sept. 1862, when Bismarck took office as minister president, William's personality tends to be obscured by that of his masterful servant. Yet he was no cipher. His prejudices, indeed, were apt to run athwart the minister's plans; as in the Schleswig-Holstein question, when the king's conscience regarding the claims of the Augustenburg prince threatened to wreck Bismarck's combinations. But, as Bismarck put it, the annexation of the duchies gave him "a taste for conquest," and in the campaign of 1866 the difficulty was to restrain the king, who wished to enter Vienna in triumph.

In 1870–71 again it was Bismarck and not the king that gave the determining impulse. King William's attitude was strictly correct; and the excitement which it aroused in France was due to Bismarck's editing of the Ems telegram. On the French declaration of war all Germany rallied round the king of Prussia, and when, on July 31, he quitted Berlin to join his army, he knew that he had the support of a united nation. It was during the siege of Paris, at his headquarters in Versailles, that he was proclaimed German emperor (Jan. 18, 1871). On March 21, he opened the first imperial parliament of Germany; on June 16, he entered Berlin at the head of his troops.

After that period the emperor left the destinies of Germany almost entirely in the hands of Bismarck. In his personal history the most notable events were two attempts upon his life in 1878, on the second of which he was seriously wounded. Until within a few days of his death the emperor's health was remarkably robust; he died at Berlin, March 9, 1888.

William I.'s military writings were published in 2 vols. at Berlin in 1897. Of his letters and speeches several collections have appeared: *Politische Korrespondenz Kaiser Wilhelms I.* (1890); *Kaiser Wilhelms des Grossen Briefe, Reden und Schriften* (2 vols., 1905), and his correspondence with Bismarck (ed. Penzler, Leipzig, 1900). A large number of biographies have appeared in German, of which may be mentioned L. Schneider's *Aus dem Leben Kaiser Wilhelms* (3 vols., 1888; Fr. trans., 1888); Oncken, *Das Zeitalter Kaiser Wilhelms* (2 vols., 1890–92); F. Delbrück, *Die Jugend des Königs Friedrich Wilhelm IV. von Preussen und des Kaisers u. Königs Wilhelm I., Tagebuchblätter* (1907); E. Marcks, *Kaiser Wilhelm I.* (Leipzig, 1897; 5th ed. 1905). In English have appeared *William of Germany*, by Archibald Forbes (1888), a translation of Edouard Simon's *The Emperor William and his Reign* (2 vols., 1886). *See* also GERMANY.

WILLIAM II. (1859-), German emperor, was born on Jan. 27, 1859, eldest son of Prince Frederick William of Prussia and Princess Victoria of England. Even as a young prince he had to feel the conflict of opinions then swaying Germany. His mother always remained at heart a foreigner there; deeply convinced of the excellence of English institutions, she regarded her new home as a backward country; in particular, she always looked on her father-in-law's minister, Bismarck, as a personal antagonist—a view which he returned with interest. Clever, but imperious and essentially cold, Princess Victoria was never able to win the heart of her son. The Crown Prince Frederick William had grown up in an age when the ideas of liberalism had become general among the educated classes of Germany, and was himself deeply influenced by them. He was often accused of lacking initiative, and despite occasional revolts, of being too much influenced by his wife's stronger will. As a soldier he did his duty in the great wars of 1866 and 1870, and, with the assistance of expert advisers, won great successes on the battle-field; but he was never primarily a soldier. His diaries show a wide range of interests, but little serious occupation with any one definite subject. His whole nature and views seemed un-Prussian to the old Emperor William I. and his circle. He was kept wholly outside official business, and thus up to the 60th year of his life he was obliged to stand beside the throne in the part of a critic without influence.

Education and Character.—His eldest son grew up in a different spiritual atmosphere. The great victories over Austria and France, the foundation of a new German empire and the winning of the German Crown by the Hohenzollerns were the dominating impressions of his boyhood years. He shared the enthusiasm felt by his generation for Bismarck and for the glorious German army. Thus from an early age he was really at variance with the spirit reigning in his parents' house. His father and mother wished to train him in other ways by giving him a middle-class education, quite contrary to the traditions of the Hohenzollern dynasty. They sent him to the gymnasium in Kassel. But although nominally a student like all the rest, yet for teachers and comrades alike he still remained always the prince and future emperor. None the less, these school years had an important effect on his intellectual development; all the solid knowledge he ever had was acquired in this period. He always retained a great devotion and respect for Professor Hinzpeter, the head of the Kassel gymnasium. In Jan. 1877 the young prince passed his final examination in Kassel. He was then sent for six months to serve in the first regiment of Guards, and afterwards to the University of Bonn, where he studied constitutional law and political economy. He passed two years at Bonn, but here again failed to come into really close contact either with his teachers or with the students.

After the autumn of 1879 military training definitely took the first place; the prince spent the next years chiefly in Potsdam, and although he was introduced by the chief president of the Province of Brandenburg into the secrets of civil administration, this was only a secondary occupation. His years with the corps in Potsdam again brought him into touch almost exclusively with the views predominant among Prussian nobles and corps of officers. The veneratior paid him here suited his wilful and imperious nature better than the spirit of the middle class school or of his parents' house. Sustained work was never demanded of him, and consequently he never learnt to perform it. In Feb. 1881 he married Princess Augusta Victoria of Schleswig Holstein-Augustenburg, daughter of the Prince Frederick who in 1864 had crossed Bismarck's plans by aspiring to the throne of Schleswig-Holstein. The prince had been for long a personal friend of the Crown Prince Frederick William. The old emperor and Bismarck approved of this marriage, as tending to bring about a reconciliation with those elements in Schleswig-Holstein which still maintained the rights of the Augustenburgs. The young princess had been brought up very simply and piously; she had no great intellectual powers. Six sons and a daughter were born of the marriage. Prince William had come little before the eyes of the public, when his father's sudden death on June 15, 1888, brought him to the throne.

The new emperor was certainly a man of intellectual gifts above the average. He had a quick apprehension which enabled him to form in a short time a general view of matters which interested him, but which also seduced him into satisfying himself with these quick, superficial impressions and thinking it unnecessary to penetrate more deeply into the heart of a problem. He also possessed an extraordinarily happy turn of speech, equally effective in intimate conversation and in dealing with large audiences. His oratorical gifts, often, indeed, led him, particularly when he was speaking in public, into saying more than he really meant. He often found himself carried away, by his own inner excitement and by the admiring astonishment of his listeners, into ill-considered remarks afterwards turned against him on the battle-ground of politics. He was most profoundly persuaded of the importance of his imperial office, and of his duty to maintain his authority as monarch. Never doubting that the monarchy was a divine institution, he believed firmly that God, who had set him in this place, would also show him the right way in the exercise of his sovereign duties.

In a letter to Bismarck written two years before his death, William's father had complained of his eldest son's immaturity and inexperience, which was coupled with an inclination to overestimate his own powers. This was, indeed, a just criticism of very important traits in William's character. He was unready and unripe in mind when he ascended the throne at the age of twenty-nine. He never attained that spiritual maturity which comes only through heartfelt co-operation in great tasks and earnest consideration of the problems of the world and of life. His personality lacked the solid background of a definite philosophy of life; thus he always remained dependent on the impressions of his immediate surroundings and on the influences of those persons who knew how to win his ear and flatter his vanity. Nor had he any definite religious convictions which might have given him this inner firmness; for although he believed in the basic dogmas of Christianity, yet he was as strongly affected by the confusing influence of the modern technical and intellectual culture and really never knew at heart how far he could give way to it without violating the traditional religious beliefs so essential for his monarchic sentiments.

He has often been compared with Frederick William IV., and there were certainly many points of resemblance between him and his great-uncle; but the deep difference between them lay in the fact that Frederick William's whole nature was rooted in a definite philosophy of the world which always turned the scale at the critical moments of his life, despite all wavering in points of detail, while this firm basis was lacking in William II. Consequently he was never free from a feeling of inner uncertainty, which he tried to hide from the outward world under a pompous manner and by big words. As soon as he showed himself in public he put on the mask of the emperor. When he laid it aside there remained a man of fine talents, but of moderate education and weak character, vain and wilful through excess of self-consciousness, who felt himself most at home in amusements of a very common sort, and liked to surround himself with subservient people who suffered his not always tactful jokes with becoming respect. A great and increasing part of his time was taken up with journeys, with official appearances, with parades and shows, while real work receded more and more into the background.

When he became emperor he knew very little of the details of foreign policy. He had only a few definite principles, to which he always remained true. First among these came the maintenance of his own monarchic status at home and of Germany's international position. This in his opinion required not only a strong army, which Germany already possessed, but also a strong fleet, which he set about forming. The big increase of military forces was intended not only to enable Germany to defend herself against possible attack, but also to increase her prestige and to ensure her her share in the partition of the world's territories which was proceeding rapidly. He believed that the likelihood of ever having to make serious use of these armaments would decrease in inverse proportion to the strength of them. He never had any warlike intentions or ambitions; he certainly always felt at heart that he was lacking in the military gifts requisite for command in a great modern war. On the other hand, he felt that his duty

to himself as monarch forbade him to leave the control to others.

William's Relations with his Ministers.—When the new emperor mounted the throne, Bismarck was still in charge. While still a prince, William had often assured him of his admiration, although there had, indeed, already been several small disagreements, the story of which Bismarck has told in the third volume of his *Gedanken und Erinnerungen.* But it was in any case hardly likely that a young man of so lively a temperament and so keen an ambition to bring affairs under his personal control could agree for long with a minister who had conducted the Government according to his own principles for a generation, and who was not inclined to subordinate himself to the wishes of a young and inexperienced monarch. Bismarck felt from the first that in the personality of the emperor were inherent grave dangers for Germany's peaceful development and for the settlement of her international relations, and thought himself bound to confine the emperor's influence on policy within the narrowest limits possible. In these circumstances a collision was inevitable, and the occasion which finally led to the split was of comparatively minor importance. The repeated great strikes in the Rhenish Westphalian coal fields had inclined the emperor to listen to the counsels of his former teacher, Hinzpeter, who urged that his duty was to meet the wishes of the workmen half way and to remove their discontent by a wide measure of social reform. He demanded suddenly an announcement of such measures on the occasion of his coming birthday.

The friction began when Bismarck, in view of the great importance of such a proclamation, demanded close scrutiny and preparation in detail. It was increased by differences of opinion with regard to the prolongation of the state of emergency against the Social Democrats, and led to personal conflicts of increasing violence. Bismarck had undoubtedly determined to remain in office even against the emperor's will, and attempted to persuade the other ministers to declare themselves one with him. At last, on the strength of a cabinet order of 1850, he forbade the individual ministers to report to the emperor except in his presence; the emperor saw in this an attempt to eliminate his influence and demanded that this cabinet order be revoked. Bismarck refused to give the order, and the emperor then sent word that he expected the chancellor to tender his resignation. This Bismarck did on March 18, 1890, and it was immediately accepted by the emperor.

After Bismarck's dismissal the emperor announced that the course of the ship of State was to remain the same, even though the steersman had been changed. He proposed to take over command of the ship himself, and called to the leading posts men wholly unacquainted with the duties which they were to assume, in order to secure himself from supervision by experts. General von Caprivi became imperial chancellor and Freiherr von Marschall, a former lawyer, secretary of State for foreign affairs. Such men were meant only to be channels for executing William's will. Indeed, the emperor believed up to the end of his reign that he himself was the real guiding force of all German policy. If, however, we consider more closely the system of government which developed after Bismarck's dismissal, we find that the emperor's influence was not nearly so great as most of his contemporaries assumed. The right which he enjoyed of nominating at his personal discretion the imperial chancellor, the secretaries of State and the Prussian ministers naturally gave him great influence.

Yet the emperor could not lay down a consistent line of policy, if only for the reason that he himself possessed no solid views, based on definite convictions, in the main questions, and that he had neither the will nor the perseverance to help with hard, sustained work on the big issues. This was apparent even in foreign affairs, which attracted his chief interest. The emperor read a great part of the despatches from the ministers abroad and added notes to them, mostly expressing his views at the moment, but seldom containing real political directions. Reports were rendered to him verbally or in writing on important questions and his decisions were put away in the files. He also often had political conversations with the representatives of foreign powers and made a rule of reporting all these in detail to the Foreign Office. When he was travelling, which was often the case, he was accompanied by a member of the diplomatic service who saw to communications between him and the Foreign Office.

Very often, and particularly in important questions, he let himself be persuaded by his ministers into decisions altogether contrary to his own views. For example, immediately after Bismarck's dismissal, he allowed Caprivi and Holstein to dissuade him from renewing the re-insurance treaty with Russia, although he personally wished, and had, indeed, already consented to renew it. Later he always disapproved at heart of Holstein's and Bülow's policy in Morocco, but allowed himself time and again to be persuaded into approving of the measures proposed by his advisers. On the whole, William II. did not so much exercise a real, lasting control, as produce confusion by sudden and impulsive interference.

In foreign policy, after Bismarck's dismissal, as the new chancellor and the new secretary of State had absolutely no experience in this field, the actual control fell into the hands of Baron von Holstein, chief of the political department in the Foreign Office, a mistrustful and misanthropic eccentric who shrank from any sort of public appearance, never reported to the emperor or appeared in parliament, but provided the ministers with his information from the seclusion of his office. He always regarded the emperor's personality and inclination to personal interference with the greatest mistrust. When the chancellor and secretary of State, out of loyalty to their sovereign—a feeling very little developed in Holstein—put up too weak an opposition to the emperor, he tried by every kind of intrigue to egg them on or else to turn them out, and had them attacked in the press with which he was connected. Consequently during the decade after Bismarck's dismissal there was a continual feeling of crisis which might at any moment have led to grave conflicts.

The events of William II.'s reign will be found elsewhere. (*See* GERMANY.) Here we can only attempt to indicate the emperor's personal share in the most important decisions of this time, beginning with foreign policy.

Foreign Policy.—Although the non-renewal of the re-insurance treaty was contrary to the emperor's wish, the *rapprochement* with England which began with the conclusion of the Heligoland treaty, undoubtedly accorded at the time with his personal wishes. He was anxious to create a counterpoise to the pressure of the incipient Franco-Russian *rapprochement* by strengthening relations between the Triple Alliance and England. But he very soon experienced bitter disappointments; the interests of Germany and England clashed violently in Africa, and England, after the outbreak of the Chinese-Japanese War (1894) followed the opposite policy to Germany in the Far East. Germany's intervention in this struggle against Japan and on the side of France and Russia was essentially the work of Baron von Holstein. The emperor had at first shown great personal sympathies for the military efficiency of Japan, but skilful working on his Christian sentiments and his fear of the "yellow peril," persuaded him to fall in with Holstein's advice; especially as this coincided with his personal ambition to seize the occasion to secure for Germany a naval base in the Far East. He then promised the tsar of Russia support if the latter's Far Eastern policy led him into difficulties, the tsar, in return, consenting on Russia's behalf to Germany's occupying a Chinese port.

After these events had brought about a coldness between Germany and England, the emperor devoted his chief attention to strengthening the German war fleet, in which he had always felt a strong personal interest. He used every opportunity, public and private, to advocate this move, because he was convinced that Germany would only be able to follow a policy independent from England if she was covered against attack from the sea by a strong navy of her own. Throughout his entire reign, the expansion of German sea power remained one of the unaltered principles of his policy; from 1897 on he found in Admiral von Tirpitz, the secretary of State for naval affairs, an enthusiastic assistant in these plans, who was capable of giving them practical form and of defending them against statesmen and parliament.

If the emperor's naval policy already showed a deep mistrust of England, this was intensified by British policy towards the Boers. When Jameson made his raid into the Transvaal in 1896,

the emperor seriously thought of breaking off diplomatic relations with the British Government if it countenanced Jameson's conduct. He even planned a military intervention in favour of the Boers; his advisers only restrained him from doing so, with difficulty, by proposing instead the despatch of the notorious telegram to President Kruger. The growing tension of relations with England made the emperor increasingly ready to adopt the idea, originally put forward by Holstein and afterwards also repeatedly advocated by Bülow, of seeking *rapprochement* with France via St. Petersburg (Leningrad) in order to create a counterpoise to the threatening increase of British power through an alliance of all the great European continental States, the so-called Continental Alliance. It may, however, be doubted whether all these efforts were not only meant to serve to bring England to change her policy and enter into closer relations with Germany. For the emperor always retained a lively sympathy for England, which was expressed in particularly vivid fashion in the reports which he sent to the German Foreign Office on his frequent visits to that country. On the other hand, he also felt himself attracted to Russia by old family traditions and by the consciousness of common monarchic interests, and probably never really made up his own mind which of these two countries would prove the more valuable ally for Germany. Holstein and Bülow, who thought Germany would do best to bind herself to neither of these two Powers, but to sell her support to the one or the other, as the case arose, for concrete concessions, took advantage of the emperor's uncertainty to restrain him from entering into any binding engagements on one side or the other. Bülow flattered his vanity by representing to him that he would then become the arbiter of the world. Nevertheless, when England began in the spring of 1898, at Chamberlain's instigation, to sound Germany regarding a German-English alliance, William II. showed a real inclination to accept this offer, and all his advisers' cunning and precautions were needed to keep him in the path which they considered desirable.

After the failure of these negotiations, when England first drew closer to France and Russia and the path was cleared for the Entente, Berlin began to grow apprehensive. Holstein and Bülow thought it their duty to show the world, in the Morocco question, that France and England were not to be allowed to dictate the partition of the world's remaining colonial territories without reference to Germany, especially as Russia was at the time completely immobilized by her severe struggle with Japan. The emperor, whose personal view it was that German interests in Morocco were not large enough to justify such an attitude, and who only a short while previously had told the king of Spain that Germany demanded nothing for herself in Morocco, was utterly opposed to such interference. Bülow needed all his art of persuasion to persuade him to land in Tangier on his Mediterranean voyage in March 1905. Up to the last moment he hesitated whether to do this. Here he certainly showed more political wisdom than his advisers, but once again he was too weak to carry his point against them. The result of Germany's action here was not only to make her relations with France more strained, but also to confirm the Franco-British entente. It is well-known that the agreements between these two Powers for military and naval co-operation in case of war were a result of the Morocco crisis.

Another reason why the emperor viewed the increasing tension of Franco-German relations with alarm was because, after the failure of the negotiations for an alliance with England, he had resumed with new zest the idea of a Continental Alliance. Bülow prevented him from intervening during the delicate negotiations with Paris on the preparations for the Algeciras conference, but only by concealing from him altogether the offer made by Rouvier, the French minister-president, for a general understanding with Germany. He consented, however, that the emperor should take advantage of his meeting with the tsar in Finland to conclude with him a treaty, to which France should afterwards be asked to adhere. The emperor in fact succeeded at the meeting in Björkö (July 23, 1905) in persuading the tsar Nicholas to sign an offensive and defensive alliance. He believed that he had won a great success, and wrote to Bülow that the meeting had been a turning point in the history of the world. This, however, soon proved to be a complete error; when the tsar returned to St. Petersburg his ministers persuaded him to demand a revision of the treaty, as in its existing form it was irreconcilable with the provisions of the Franco-Russian treaty. As the alterations proposed by Russia would have deprived the treaty of its whole value for Germany, it was thought best to drop the whole affair and the Björkö treaty was buried for good and all.

Germany's situation now grew increasingly dangerous; Russia's adhesion to the Franco-British entente (1907) was followed by growing tension between Germany and England, due principally to the fears aroused in England by the German naval programme. Various early attempts by England to reach an understanding with Germany on the naval armaments of the two Powers broke down because the emperor, in agreement with Admiral von Tirpitz, maintained that any engagement of this sort was dishonourable to Germany. On this point Bülow disagreed with the emperor. He would willingly have negotiated with England on a limitation of armaments; but when King Edward visited Friedrichshof in Aug. 1908, the emperor told the British official, Hardinge, most abruptly, that he would not agree to any negotiations of the sort, and Bülow thought it better not to press his own view any further at present, hoping to be able to convert the emperor gradually. In the autumn of 1907 the emperor visited England, and made remarks which, in his opinion, were calculated to remove the apprehension aroused in England by the German naval programme. Soon after, these remarks were published as an interview with the *Daily Telegraph,* but produced exactly the opposite effect to that which had been intended. They were looked on in England as an attempt by a foreign monarch to interfere in England's private affairs. In Germany also the publication evoked lively disapproval and led to a question in the Reichstag and to an excited debate on the emperor's personal conduct of affairs. The emperor was obliged to make a declaration (Oct. 31, 1908), that he would in the future undertake no political step of importance without the chancellor's advice.

The first conflict between the Triple Alliance and the Entente arose over Austria's annexation of Bosnia in the autumn of 1908, in consequence of the Young Turk revolution. Serbia protested against the annexation, and as Russia supported her, a severe crisis broke out. Here again the emperor and Bülow differed. The emperor was shocked by Austria's action, which she had taken without previously informing Germany. He accused Vienna of duplicity and said that he personally felt himself most deeply wounded in his sentiments as an ally. Bülow, however, fearing that Germany would lose her last reliable ally, thought it right to support Austria at all costs.

Soon afterwards, Bülow, having been defeated in the Reichstag on the question of financial reform, again offered his resignation, which was this time immediately accepted by the emperor. The chancellor had long enjoyed his particular favour; but their relations had become increasingly unhappy for some time past. This was due partly to differences on points of policy, but even more to the emperor's feeling that Bülow had deceived him and left him in the lurch over the *Daily Telegraph* affair. Bethmann-Hollweg was now appointed imperial chancellor; but the emperor never really trusted him. Bethmann-Hollweg's earlier career had been passed in the internal administrative service and he himself realized his own lack of experience in foreign affairs; he therefore insisted on the appointment of Kiderlen-Wächter, formerly minister in Bucharest, as secretary of State. Kiderlen-Wächter enjoyed a reputation for unusual skill and energy, but more than ten years previously he had incurred the emperor's personal dislike in a private matter. He was primarily responsible for the new collision with France which arose in 1911 when the French began to bring Morocco under their rule altogether. Here again the emperor was against letting a fresh quarrel between Germany and France arise over Morocco. At his instigation, a treaty with France had been concluded in Feb. 1909, while Bülow was still in office, allowing France an exceptional position in Morocco. Kiderlen, however, believed that France would be prepared to cede the French Congo wholly or in part to Germany in return for a free hand in Morocco; he succeeded in making the emperor be-

lieve that this could be reached at the cost of a little pressure. Here again William yielded against his own better judgment to pressure from his advisers and agreed to the despatch of the "Panther," a small ship of war, to the Moroccan coast. Kiderlen did, indeed, obtain some of his demands, but the resentment in France now grew increasingly serious, and Germany's relations with England, who felt herself particularly pledged to support France over Morocco, deteriorated correspondingly.

Nevertheless one more opportunity for a German-English *rapprochement* seemed to offer itself, when the peace of Europe was dangerously threatened by the outbreak of the Balkan Wars. Relations seemed to have become really happy when Lord Haldane, the British War Minister, visited Berlin in Feb. 1912 on an official mission, and held personal conversations with the emperor, Tirpitz and Bethmann-Hollweg. The emperor in his sanguine fashion believed that his interview with Haldane had resulted in a complete understanding, but failed to see that the limitation of Germany's naval armament was still the British *sine qua non*; whereas he himself and Tirpitz were just engaged in drafting a new bill for increasing the rate of naval construction. This attempted *rapprochement* thus led to renewed coolness.

When the murder of the heir to the Austrian throne precipitated a crisis which led to the World War, the emperor was determined from the start to help Austria to get satisfaction from Serbia. Real difficulties could only arise if Russia took Serbia's part. The emperor, however, reckoned firmly on the community of monarchical interests, which he believed would prevent the tsar from coming forward as protector to the murderers of a prince. He failed to see that the final decision in Russia did not really lie with the weak tsar at all. The emperor himself did not at first imagine that any danger of war could arise. He started off on his Baltic cruise, without making any preparations; the alleged "Crown council" in Potsdam never took place. He did not return till after the Austrian Note to Belgrade had already been delivered; and he personally thought the Serbian answer quite fitting to form a basis for future negotiations. He disapproved when, despite this answer, Austria mobilized and declared war on Serbia, and he undoubtedly approved of Bethmann-Hollweg's eleventh-hour attempt to persuade the Austrians to hold their hand and to negotiate directly with Russia. He also sent a number of personal telegrams to the tsar Nicholas to try to restrain him from the mobilization which finally led to the outbreak of the war, and to offer him his mediation. All these endeavours to maintain peace proved, however, unsuccessful. The idea that the emperor wished for a war in order to found a German world empire, or to make any conquests at all, though widely current during the war, is, in the opinion of the writer, incorrect.

Interference in Internal Policy.—The emperor's interventions in German internal policy were also irregular. The first occasion was when he called on Bismarck to proclaim a far-reaching social and political reform. Only a small fraction of this was carried out during the first years of his reign. As these measures had not the desired effect of winning the mass of the workers from Social Democracy, a feeling of disappointment overcame the emperor. He always looked upon Social Democracy, which was republican on principle, as the irreconcilable enemy of the whole existing order, and particularly of the monarchy, and held it to be his duty to fight against it with all the means in his power. The murder of the French president, Carnot, seemed to him to be a sign of the increasing effect of international social propaganda, and after the autumn of 1894 he pleaded repeatedly in his speeches that the revolutionary movement must be fought, and called on his ministers to bring in fresh emergency legislation penalizing all attempts to overthrow the social order and any agitation in favour of class hatred with penal servitude. It was the differences which this bill evoked among the emperor's advisers that led to the dismissal of Caprivi in Oct. 1894 and the appointment of Prince Hohenlohe as imperial chancellor. Hohenlohe brought in a bill, which was rejected by the Reichstag in May 1895. The emperor, however, returned again and again to the idea but was never able to carry it through.

Another matter which caused him anxiety was the increasing influence of the Centre Party in the Reichstag and in the Prussian diet. Himself a Protestant, he resented the growing power of the Catholic elements. He intervened personally when the Centre allied itself with the Conservatives and attempted to pass a primary education act for Prussia, which would have increased the influence of the Church in the schools to an extraordinary degree. Being hostile both to Social Democracy and to the Centre party, the emperor naturally looked with sympathy on the idea of forming a working majority in parliament by a coalition between the Conservative and Liberal parties. Prince Bülow, who had become Imperial Chancellor in 1899, attempted to put this idea into practice, his own feelings agreeing here with the emperor's. The elections of Jan. 1907, which brought the so-called "Bloc Parties" a considerable majority, seemed to the emperor to be a personal victory for himself. Bülow's inability to form a permanent coalition between the Bloc Parties, and to carry through the urgent financial reform by their help, seemed to the emperor a proof that the chancellor was incapable of carrying through his principles in domestic policy and strengthened him in his decision to accept his resignation.

The emperor did not openly rebel against the constitutional form of government which he found on his accession, since he saw the impossibility of altering it, but at heart he always disliked it, and his dislike increased in proportion to the numerical growth of Social Democracy and of the Centre in the parliaments. He looked on parliament as a necessary evil, and always considered the monarch to be the true vessel of sovereign power, appointed thereto by God. The opposition raised by the Reichstag to the emergency legislation which he desired, and the difficulties which had to be overcome over every increase of the army or the fleet led him on many occasions into bitter remarks about the people's representative. The emperor never had any new and constructive ideas on matters of domestic policy.

The World War.—On the outbreak of the World War, the emperor himself felt his own inability to take over the supreme command of the military operations. During the first years of the war an appearance was kept up of referring the last decisions to the imperial headquarters; but William was increasingly reduced to the position of a mere onlooker. The choice of leaders lay, indeed, in his hand, and here he did not always show the best judgment. He only agreed with reluctance, and under the pressure of emergency, to make Hindenburg commander-in-chief and to leave the real decisions to him and Ludendorff. The inaction of the German fleet during the first years of the war is also to be attributed to the emperor's personal wish, and involved him in a sharp difference with Admiral von Tirpitz.

After Aug. 1918 it became ever clearer that the existing situation was growing untenable; and now the emperor proved himself once again incapable of a firm decision. He was driven forward step by step by events and by individual advisers who managed to win his ear. A Crown Council under his presidency resolved to initiate peace negotiations; yet he allowed so much time to be wasted before this decision was executed, that in the meantime the military situation took a turn fatal for Germany. At the same time the signs of discontent in the population and in parliament increased, and he let himself be persuaded to appoint Prince Max of Baden imperial chancellor in Oct. 1918, although the prince was looked on as an advocate of the parliamentary methods which the emperor hated in his heart. After this, when President Wilson in his proclamations showed clearly that he considered the person of the emperor to be a real obstacle to the conclusion of peace, Prince Max, in agreement with the majority of the Reichstag, called upon the emperor to abdicate, a step which was not at first thought to involve the removal of the Hohenzollern dynasty. The outbreak of the revolution at the beginning of Nov. 1918 and its rapid growth made an immediate decision urgently necessary. As the emperor hesitated, Prince Max acted on his own authority, and on Nov. 9, proclaimed that the emperor would renounce the throne and the crown prince the succession, and that a regency was to be formed. The victorious Socialist party, however, was no longer satisfied with these concessions but proclaimed a republic.

The emperor, who was at that time on the western front, was now confronted with a very difficult decision. He might have ventured an attempt to overthrow the revolution by force by detaching a portion of the army on the western front, whose loyalty to the sovereign was not yet shaken. It was, however, doubtful whether the remainder of this army would be able, meanwhile, to defend Germany's western frontiers against the increasingly violent attacks of the enemy. Or again, he might have placed himself at the head of his army and sought death on the field of battle. Both these were courses which only a strong and confident personality could have taken. William II. preferred to abandon the army, steal quietly away from the territory of his former empire, and escape to Holland on Nov. 10. His action dealt a fatal blow to the monarchist cause in Germany. The minor princes now saw no issue but to capitulate and to abdicate before the revolution.

On arrival in neutral Holland, William was interned. The castle of Doorn was given him as a residence and he lived henceforth in complete retirement from the world. During the peace negotiations the idea arose from time to time among Germany's enemies of demanding his extradition and punishing him for initiating the war, of which he was unjustly accused. Finally, however, this idea was abandoned. The most important change in William's circumstances during these last years was his second marriage, after the death of the Empress Augusta Victoria, with the widowed Princess Hermine of Schonaich-Carolath. He used occasionally to receive German visitors in Doorn, but avoided any public appearance.

WILLIAM I. (1772–1844), king of the Netherlands, born at The Hague on Aug. 24, 1772, was the son of William V., prince of Orange and hereditary stadtholder of the United Netherlands by Sophia Wilhelmina, princess of Prussia. In 1791 he married Frederica Wilhelmina, daughter of Frederick William II., king of Prussia, thus cementing very closely the relations between the houses of Orange-Nassau and Hohenzollern. After the outbreak of war with the French republic in 1793, he distinguished himself in the struggle against the revolutionary army under Dumouriez by the capture of Landrecies and the relief of Charleroi. By the victories of Pichegru the stadtholder and all his family were, however, compelled to leave Holland and seek refuge in England, where the palace of Hampton Court was set apart for their use. He afterwards made Berlin his residence, and took an active part in the unfortunate campaign under the duke of York for the reconquest of the Netherlands. After the peace of Amiens he had an interview with Napoleon at Paris, and received some territory adjoining the hereditary domains of the house of Nassau in Westphalia as a compensation for the abandonment of the stadtholderate and the domains of his house. William refused, however, in 1806, in which year by the death of his father he became prince of Orange, to separate his interests from those of his Prussian relatives, and fought bravely at Jena. He was therefore despoiled by Napoleon of all his possessions. In 1809 he accepted a command in the Austrian army under the archduke Charles and was wounded at the battle of Wagram. When Holland rose in revolt against French domination in 1813, after eighteen years of exile he landed at Scheveningen (on Nov. 19) and was on Dec. 3, proclaimed prince sovereign of the Netherlands. His assumption in 1814 of the title of king of the Netherlands was recognized by the Powers, and by the Treaty of Paris his sovereignty was extended over the southern as well as the northern Netherlands, Belgium being added to Holland "as an increase of territory." After the battle of Waterloo, in which Dutch and Belgian troops fought side by side under his command, the congress of Vienna further aggrandized him by making him sovereign of the territory of Luxembourg with the title of grand duke.

William failed to realise that religious, racial and other differences made the union of the Netherlands and Belgium difficult. He drew up a constitution, which was accepted unanimously by the Dutch, but was rejected by the Belgians, because it contained provisions for liberty of worship. The king, however, by a subterfuge declared that the fundamental law had been approved. The new constitution, therefore, started badly, and it was soon evident that William intended to make his will prevail, and to carry out his projects for what he conceived the social, industrial and educational welfare of the kingdom regardless of the opposition of Belgian public opinion. For the discontent which culminated in the revolt of 1830 *see* BELGIUM: *History*. The Dutch were almost without striking a blow expelled from the country, the strongly fortified seaport of Antwerp alone remaining in their hands. Had the king consented at once to the administrative autonomy of Belgium, and appointed the prince of Orange governor of the southern Netherlands, the revolt might perhaps have been appeased. William, however, was too proud and too obstinate to lend himself to such a course. He appealed to the Powers, who had, in 1815, created and guaranteed the independence of the kingdom of the Netherlands. By the treaty of the eighteen articles, however, concluded at London on June 29, 1831, the kingdom of Belgium was recognized, and Leopold of Saxe-Coburg was elected king. William refused his assent, and in August suddenly invaded Belgium. The Belgian forces were dispersed, and the Dutch would have entered Brussels in triumph but for the intervention of the French. Still, however, William declined to recognize the new throne, and he had behind him the unanimous support of Dutch public opinion. For nine years he maintained this attitude, and resolutely refused to append his signature to the treaty of 1831. His subjects at length grew weary of the heavy expense of maintaining a large military force on the Belgian frontier and in 1839 the king gave way. He did so, however, on favourable terms and was able to insist on the Belgians yielding up their possession of portions of Limburg and Luxembourg which they had occupied since 1830.

A cry now arose in Holland for a revision of the fundamental law and for more liberal institutions; ministerial responsibility was introduced, and the royal control over finance diminished. William, however, disliked these changes, and finding further that his proposed marriage with the countess d'Oultremont, a Belgian and a Roman Catholic, was very unpopular, he suddenly abdicated on Oct. 7, 1840. After his abdication he married the countess and spent the rest of his life in quiet retirement upon his private estate in Silesia. He died in 1844.

WILLIAM II. (1792–1849), king of the Netherlands, son of William I., was born at The Hague on Dec. 6, 1792. When he was three years old his family was driven out of Holland by the French republican armies, and lived in exile until 1813. He was educated at the military school at Berlin and afterwards at the University of Oxford. He entered the English army, and in 1811, as *aide-de-camp* to the duke of Wellington, took part in several campaigns of the Peninsular War. In 1815 he commanded the Dutch and Belgian contingents, and won high commendations for his courage and conduct at the battles of Quatre Bras and Waterloo, at the latter of which he was wounded. The prince of Orange married in 1816 the grand duchess Anna Pavlovna, sister of the tsar Alexander I. In 1830, on the outbreak of the Belgian revolution, he went to Brussels, and tried to bring about a peaceable settlement on the basis of the administrative auton-

omy of the southern provinces under the house of Orange. His father had given him powers to treat, but afterwards threw him over and rejected the terms of accommodation that he had proposed. He withdrew on this to England and resided there for several months. In April 1831 William took the command of a Dutch army for the invasion of Belgium, and in a ten-days' campaign defeated and dispersed the Belgian forces under Leopold I. after a sharp fight near Louvain. His victorious advance was stayed by the intervention of the French. In 1840, on the abdication of his father, he ascended the throne as William II. The peace of 1839 had settled all differences between Holland and Belgium, and the new king found himself confronted with the task of the reorganization of the finances, and the necessity of meeting the popular demand for a revision of the fundamental law, and the establishment of the electoral franchise on a wider basis. He acted with good sense and moderation, and, although by no means a believer in democratic ideas, he saw the necessity of satisfying public opinion and frankly gave his support to larger measures of reform. The fundamental law was altered in 1848 and the Dutch monarchy, from being autocratic, became henceforth constitutional. The king's attitude secured for him the good will and affection of a people, loyal by tradition to the house of Orange, and the revolutionary disturbances of 1848 found no echo in Holland. William died suddenly on March 17, 1849.

WILLIAM III. (1817–1890), king of the Netherlands, son of William II., was born at Brussels on Feb. 19, 1817. He married in 1839 Sophia, daughter of William I., king of Württemberg. The marriage was an unhappy one, and ended in complete estrangement. William had no sympathy with political liberalism, but throughout his long reign of forty-two years, with a constant interchange of ministries and many ministerial crises, he never had a serious conflict with the states-general. He was economical, and gave up a third of his civil list in order to help forward the task of establishing an equilibrium in the annual budget, and he used his large private fortune to forward schemes of social and industrial progress.

William's two sons by his marriage with Sophia of Württemberg, William (1841–1879) and Alexander (1843–1884), died unmarried. By his second marriage in 1879, with the princess Emma of Waldeck-Pyrmont, he had a daughter, Wilhelmina (*q.v.*), who succeeded him. William died at the Loo, on Nov. 23, 1890.

See J. A. Bruijne, *Geschiedenis van Nederland in onzen tijd.* (5 vols., Schiedam, 1889–1906); P. Blok, *Geschiedenis der Nederlandsche Volk* (Leiden, 1908), vol. viii.; and G. L. Keppers, *De regeering van Koning Willem III.* (Groningen, 1887).

WILLIAM (1227–1256), king of the Romans and count of Holland, was the son of Count Floris IV. and his wife Matilda, daughter of Henry, duke of Brabant. He was about six years of age at his father's death, but his long minority, under the guardianship of his two paternal uncles, was peaceful. In 1247 William allowed Pope Innocent IV. to proclaim him king of the Romans in opposition to the excommunicated Frederick II., and having taken Aix-la-Chapelle, was crowned there on All Saints' Day, 1248. He thus became the recognized head of the Guelph party, but even after Frederick's death he had gained few adherents, when he was killed on Jan. 28, 1256. He was more successful in asserting the rights of John of Avennes, who had married his sister Aleidis, to the county of Hainaut against John's mother, Margaret, whom he defeated decisively at West Kappel in 1253.

See A. Ulrich, *Geschichte des römischen Königs, Wilhelm von Holland* (Hanover, 1882).

WILLIAM (1143–1214), king of Scotland, surnamed "the Lion," was the second son of Henry, earl of Huntingdon (d. 1152), a son of King David I., and became king of Scotland on the death of his brother, Malcolm IV., in Dec. 1165, being crowned at Scone during the same month. After his accession to the throne William spent some time at the court of the English king, Henry II.; then, quarrelling with Henry, he arranged in 1168 the first definite treaty of alliance between France and Scotland, and with Louis VII. of France assisted Henry's sons in their revolt against their father in 1173. In return for this aid the younger Henry granted to William the earldom of Northumberland, a possession which the latter had vainly sought from the English king, and which was possibly the cause of their first estrangement. However, when ravaging the country near Alnwick, William was taken prisoner in July 1174, and after a short captivity at Richmond was carried to Normandy, where he purchased his release by assenting in Dec. 1174 to the Treaty of Falaise. By this arrangement the king and his nobles, clerical and lay, undertook to do homage to Henry and his son; this and other provisions placing both the church and state of Scotland thoroughly under the suzerainty of England. William's next quarrel was with Pope Alexander III., and arose out of a double choice for the vacant bishopric of St. Andrews. But in 1188 William secured a papal bull which declared that the Church of Scotland was directly subject only to the see of Rome, thus rejecting the claims to supremacy put forward by the English archbishop. This step was followed by the temporal independence of Scotland, which was one result of the continual poverty of Richard I. In Dec. 1189, by the Treaty of Canterbury, Richard gave up all claim to suzerainty over Scotland in return for 10,000 marks, the Treaty of Falaise being thus definitely annulled.

In 1186 at Woodstock William married Ermengarde de Beaumont, a cousin of Henry II., and peace with England being assured three years later, he turned his arms with success against the turbulent chiefs in the north and west. Soon after John's accession in 1199 the Scottish king asked for the earldom of Northumberland, which John, like his predecessors, refused; but the threatened war did not take place, and in 1200 William did homage to the English king at Lincoln with the ambiguous phrase "saving his own rights." War again became imminent in 1209; but a peace was made at Norham, and about three years later another amicable arrangement was reached. William died at Stirling on Dec. 4, 1214, and was buried at Arbroath. He left one son, his successor Alexander II., and two daughters, Margaret and Isabella, who were sent to England after the treaty of 1209, and who both married English nobles, Margaret becoming the wife of Hubert de Burgh. He also left some illegitimate children.

See E. W. Robertson, *Scotland under her Early Kings* (Edinburgh, 1862); Lord Hailes, *Annals of Scotland* (Edinburgh, 1819); A. Lang, *History of Scotland,* vol. i. (1900); also SCOTLAND: *History.*

WILLIAM I. (d. 1166), king of Sicily, son of King Roger II. by Elvira of Castile, succeeded in 1154. His title "the Bad" probably expresses the bias of the historian Falcandus and the baronial class against the king and the official class by whom he was guided. William was far inferior in character and energy to his father, however, and the real power in the kingdom was at first exercised by Maio of Bari, whose title *ammiratus ammiratorum* was the highest in the realm. Maio continued Roger's policy of excluding the nobles from the administration, and sought also to curtail the liberties of the towns. The barons were encouraged to revolt by Pope Adrian IV., whose recognition William had not yet sought, by the emperor Manuel and the emperor Frederick II. At the end of 1155 Greek troops recovered Bari and began to besiege Brindisi.

William, however, destroyed the Greek fleet and army at Brindisi (May 28, 1156) and recovered Bari. Adrian came to terms at Benevento (June 18, 1156), abandoned the rebels and confirmed William as king, and in 1158 peace was made with the Greeks. These diplomatic successes were probably due to Maio; on the other hand, the African dominions were lost to the Almohads (1156–1160). The policy of the minister led to a general conspiracy, and in November 1160 he was murdered in Palermo by Matthew Bonello, leader of the Sicilian nobles. For a while the king was in the hands of the conspirators, but the people and the army rallied round him; he recovered power, crushed the Sicilian rebels, and in a short campaign reduced the rest of the Regno. Thus freed from feudal revolts, William confided the government to men trained in Maio's school, such as the grand notary, Matthew d'Agello. He was the champion of the

true pope against the emperor, and Alexander III. was installed in the Lateran in November 1165 by a guard of Normans. William died on May 7, 1166.

WILLIAM II. (d. 1189), king of Sicily, was only thirteen years old at the death of his father William I. when he was placed under the regency of his mother, Marguerite of Navarre. Until 1171 the government was controlled first by the chancellor Stephen of Perche (1166–1168), and then by Walter Ophamil, archbishop of Palermo, and Matthew d'Ajello, the vice-chancellor. William's character is indistinct; yet his reign is marked by an ambitious foreign policy and a vigorous diplomacy. Champion of the papacy and in secret league with the Lombard cities he defied the common enemy, Frederick II. In 1174 and 1175 he made treaties with Genoa and Venice and in February 1177 he married Joan, daughter of Henry II. of England. To secure peace with the emperor he sanctioned the marriage of his aunt Constance, daughter of Roger II., with Frederick's son Henry, afterwards the emperor Henry VI., causing a general oath to be taken to her as his successor in case of his death without heirs. This step, fatal to the Norman kingdom, was possibly taken that William might devote himself to foreign conquests. He now attacked Egypt, but Saladin's arrival before Alexandria, forced the Sicilians to re-embark in disorder. On the death of Manuel Comnenus (1180), William took up the old design and feud against Constantinople. Durazzo was captured (June 11, 1185), Thessalonica surrendered in August, and the troops then marched upon the capital; but were overthrown on the banks of the Strymon (Sept. 7, 1185). Thessalonica was abandoned and in 1189 William made peace with Isaac, abandoning all the conquests. He now planned to induce the crusading armies of the West to pass through his territories, and seemed about to play a leading part in the third Crusade. His admiral Margarito kept the eastern Mediterranean open for the Franks, and forced Saladin to retire from before Tripoli in the spring of 1188. In November 1189 William died, childless.

WILLIAM I. [FRIEDRICH KARL] (1781–1864), king of Württemberg, son of Frederick, afterwards King Frederick I. of Württemberg, was born at Lüben, Silesia, on Sept. 27, 1781. In early years he took no part in public life owing to a quarrel with his father whose deference to Napoleon displeased him; but in 1814–15 commanded an army corps in the Wars of Liberation with distinction. On his accession in 1816 he realized the expectations formed of him as a liberal-minded ruler by promulgating a constitution (1819), under which serfdom and obsolete class privileges were swept away, and by issuing ordinances which greatly assisted the financial and industrial development and the educational progress of his country. In 1848 he issued further liberal decrees; but his relations with the legislature having become hopelessly strained over questions of Germanic policy, William repudiated the enactments of 1848–49 and summoned a packed parliament (1851), which re-enforced the code of 1819.

William encountered similar difficulties as a champion of Germanic union and of the rights of the Middle Germanic States against encroachments by Austria and Prussia. In 1820–23 he protested against Metternich's treatment of the minor German States and in 1848–49 opposed the proposals for a Germanic union made by the Frankfort Diet, for fear of granting Prussia excessive preponderance. Thus he gradually became the ally of Austria against Prussia. Nevertheless his devotion to the cause of Germanic union is proved by the eagerness with which he helped the formation of the Zollverein (1828–1830), and in spite of his conflicts with his chambers he achieved unusual popularity with his subjects. He died on June 25, 1864.

See Nick, *Wilhelm I., König von Württemberg, und seine Regierung* (Stuttgart, 1864).

WILLIAM (1882–), late Crown Prince of Germany, eldest child of William II. of Germany, was born at the Marble Palace, Potsdam, on May 6, 1882. He began his military career by serving in the 1st Foot Guards, and accompanied the Kaiser to England (Jan. 19–Feb. 5, 1901) on the occasion of the funeral of Queen Victoria. On June 6, 1903 he married the Duchess Cecilia, sister of the Grand Duke of Mecklenburg-Schwerin. There were five children, four sons and one daughter, of the marriage. His political and personal interventions in public affairs gave some trouble in the years preceding the War.

On the outbreak of the World War the Crown Prince was appointed to the command of the V. Army in the west. In Sept. 1915 he received the command of an army group, and he was nominally in charge of the German operations against Verdun. His flight to Holland speedily followed that of the Emperor in Nov. 1918, and he went to Wieringen, an island in the Zuider Zee. He formally renounced on Dec. 1, 1918 his rights of succession to the crowns of Prussia and the German Empire. The ex-Crown Princess and her children, however, continued to reside at Potsdam. On Nov. 10, 1923 he suddenly returned to his estate at Oels in Silesia. There was strong feeling in France that the German Government should be compelled to surrender him, but the matter was settled by a German note which stated the act of renunciation of the ex-Crown Prince and declared that the return of the Kaiser would not be permitted. The Allied Powers declared that they would hold Germany responsible for any consequences which might arise, but the ex-Crown Prince himself declared that he would take no part in politics. His memoirs, *Ich suche die Wahrheit* were published in 1922 (English translation by R. Butler, *I seek the truth*, 1926).

WILLIAM (1533–1584), surnamed the Silent, count of Nassau and prince of Orange, was born at the castle of Dillenburg in Nassau on April 25, 1533, eldest of the five sons of William count of Nassau and Juliana of Stolberg (*see* NASSAU). The boy's father had decided leanings towards Lutheranism, his mother was a convinced adherent of the new faith. So it was not without hesitation that the emperor sanctioned an arrangement by which the great heritage of the Nassau family in his Netherlands dominions and the princedom of Orange would fall to their son, and when he did sanction it, it was on condition that the old count should surrender all claims to the guardianship and that the boy should be educated in the Netherlands, with a household of Netherlanders, and as a Catholic. To this arrangement the father consented.

William of Orange thus grew up, at Brussels and at Breda, a great Netherlands nobleman, marked out for a career in the service of the ruler. In 1551 he married Anna van Buren, an heiress of the Egmont family, adding estates in Holland to his already extensive possessions. Charles V. distinguished him with his favour. Philip II., too, began by creating Orange a member of the Brussels Council of State, and before he left the Netherlands for Spain, 1559, he made him his governor (Stadtholder) in the provinces of Holland, Zeeland and Utrecht.

If William of Orange's career was soon so startlingly to deviate from the lines of tradition laid down for him by his predecessors, it was due in the first place to the different relationships in which, in his time, the monarchy had come to stand with respect to the Netherlands. The creation of a united Netherlands state had been the historical task of the Burgundian dynasty. By successive marriages of Mary, daughter of Charles the Bold, with Maximilian of Habsburg, and of their son, Philip the Fair, with Johanna of Spain, that state had become connected with an empire with which it had few interests in common. Under Charles V. already this had created many difficulties, while his son Philip II. looked upon the Netherlands merely as an outpost of the Spanish imperialist policy.

The high nobility of the Netherlands were quick to resent the anti-national tendencies of Philip's government at Brussels. After the king's departure it was carried on by his half-sister, Margaret of Parma, as his regent, but the real force behind her was the bishop of Arras, later archbishop of Mechlin and cardinal, the Franc-Comtois Granvelle, who was made president of the Council of State. Between that zealous and docile minister and the proud, unruly nobles a bitter struggle was soon in progress, in which Orange, with the counts of Egmont and Horn and others, played a conspicuous part. When Orange and Egmont stayed away from the Council of State as a protest against Granvelle's presence there the public realized that grave issues had been raised. In 1564 Philip gave way and ordered Granvelle to depart, whereupon the Regent tried to govern with the noblemen of the Council of

State. It was a victory for the national cause, but at the same time it was a victory for class interests.

One question, which aggravated the difficulties between the ruler and the Netherlands people considerably, had suddenly become of paramount importance when the dismissal of the cardinal seemed to indicate a slackening of purpose on the part of the distant king. All through Charles V.'s reign Lutheranism had been severely kept under. To the Lutheran heresy Calvinism, spreading northward from France, was now added. Public opinion in the Netherlands was generally averse from the savage methods of suppression imposed on the government by Philip. William of Orange never was a very devout Catholic. He had maintained close relations with his Lutheran kinsmen in Germany. His brother Louis, particularly, who spent much of his time at Orange's court at Brussels or Breda, had great influence over him. In 1561, Anna van Buren having died in 1558, the prince had contracted a matrimonial alliance with German Protestantism in the person of Anna of Saxony, daughter of the late Elector Maurice, the betrayer and victor of Charles V. In order to gain the present elector's consent, as well as to quiet the objections and suspicions of Philip II.'s Government, Orange had secretly given to both sides flatly contradictory assurances. The episode shows his character on its least attractive side. But at any rate his position helped him to realize how impossible it was, in the Netherlands, surrounded by countries where Protestantism had in some form or other achieved some sort of recognition, and always open to influences from outside, to enforce a rigid Catholic supremacy. He said so boldly in the Council of State, but it was in vain that he and his friends urged the king to concede some degree of toleration. When Philip, after long delay, by the famous letters from Legovia, ordered more relentless persecution than ever, Orange, realizing the impotence of the Council of State, countenanced the action of his brother Louis, and Hendrik van Brederode, who organized the lower nobility to petition the governess for liberty of conscience. The question was thus brought before the public and excitement raised to fever pitch.

Most of the petitioners were undoubtedly good Catholics, but suddenly there now occurred the outbreak by extreme Calvinists, known as the Breaking of the Images, which brought about a violent reaction. While the nobles lately in opposition ranged themselves behind Margaret of Parma to restore order, Philip prepared to send to the Netherlands an army under the duke of Alva to chastise them and to introduce absolutism. In the interval before the arrival of the terrible duke there was much talk of organizing resistance. The prince of Orange was in doubt as to the régime to be expected, yet he shrank from co-operating with the only party ready to throw themselves into the fight, the Calvinists. As viscount of Antwerp he prevented the Antwerp Calvinists from going to the assistance of a little army of their co-religionists that was cut to pieces by Margaret of Parma's troops under the walls of the town (March 1567).

The first period of Orange's career ended in failure. After the encouragement he had given to the national opposition movement his conduct at the moment of crisis is disconcerting. To understand it one has to remember that the Calvinists still were a tiny minority, suspected and hated as a menace to society no less than to the Church. A movement in which they took the lead had, at that moment, little chance of becoming truly national, and William of Orange, who was not yet personally in sympathy with Calvinism, was then and always concerned before everything else with preserving national unity.

From Germany, where he had retired, the prince kept in touch with adherents in the Netherlands, and with money collected from them and raised in his Nassau lands, he brought together an army with which he attempted to deliver the Netherlands from Alva's tyranny (1568). The attempt failed miserably. The Netherlands, cowed, did not rise, and the army had, for lack of money, soon to be disbanded. Help, as Orange realized, could only come from outside, and nothing was to be expected from German Lutheranism. He now entered into close relations with the French Huguenot leaders, for some years taking part in their campaigns against the French Government. At La Rochelle Louis of Nassau organized the forces of the Sea Beggars, whose booty went to swell the prince's war chest. New hope was born when after the peace of St. Germain (Aug. 1570) they seemed to win influence at the court of France. Louis of Nassau and Coligny inspired Charles IX. with plans of war and conquest against Spain, and it was in the expectation of French help that Orange in 1572 repeated the attempt of 1568 and invaded the Netherlands with an army collected in Germany. The St. Bartholomew's massacre, which overthrew Huguenot influence at court dashed his hopes. Again he had to disband his army and to leave Alva in possession.

But this time there had been a response to his invasion. Not the central province of Brabant, kept quiet by the presence of Alva's army, but a number of towns in the outlying northern provinces had risen against the Spaniards. The surprise capture of the Brill by a fleet of Sea Beggars had started the movement. Now that his great plans in conjunction with France had come to nothing, the prince decided to join the Holland and Zeeland rebels, who had proclaimed him as their Stadtholder again. It seemed a forlorn hope. Compared with Flanders and Brabant, Holland and Zeeland at that time seemed poor and distant regions.

The decision was one of the great moments of his career. For four heroic years he shared the anxieties and distress of the two maritime provinces, stubbornly holding out against the Spanish army sent to subdue them. The States assemblies of Holland and Zeeland, which were almost entirely composed of burghers and of Calvinists, placed complete confidence in the great nobleman who had lost his fortune and his position for the national cause. In 1573 the prince himself joined the Reformed Church. Meanwhile he led the desperate resistance against the Spaniards. The relief of Leyden in 1574 was to a large extent due to his untiring efforts. Yet in 1576, with the Spaniards at Haarlem and Amsterdam as well as at Middelburg and Zieriksee, the two provinces were near succumbing, when the situation underwent a dramatic change.

The Spanish governor, who had succeeded Alva in 1574, Requesens, unexpectedly died. The Spanish soldiery, long unpaid, mutinied. They evacuated their hard-won posts in Holland and Zeeland and came south to live on the riches of Brabant. The Spanish Government in the Netherlands practically broke down. The States of Brabant summoned a meeting of the States-General to Brussels, and negotiations between this nominally loyal body and the two rebel provinces were started at Ghent for the purpose of combining against the Spanish soldiers. The conclusion of the Pacification of Ghent (Nov. 8, 1576) seemed to restore the unity of the Netherlands, threatened since the separate rebellion of Holland and Zeeland.

But an ominous rift threatened that unity. The Pacification, while suspending the edicts against heresy, had safeguarded the supremacy of Catholicism in all the provinces save Holland and Zeeland. Calvinist refugees were now flocking back to the towns of Flanders and Brabant, and they were not content with toleration, they wanted the same position of supremacy which their co-religionists in the two rebel provinces, in the stress of revolution and under the immediate menace of foreign attack, had managed to secure. This irritated the nobility, who in the south had greater power and were everywhere slow to embrace Calvinism, while the French-speaking provinces, like Hainaut, or Lille, Orchies and Douai, were now almost solidly Catholic. Orange was fully alive to the danger of these elements gravitating back to the king.

But in many respects his position was a thoroughly false one. Circumstances had ever since 1567 conspired to drive him into closer association with Calvinism. The Calvinists who had obtained control in the provinces of Holland and Zeeland did not dream of sacrificing any of their local supremacy to the national compromises elaborated at Brussels. Yet those two provinces continued to afford to the prince his firmest *point d'appui* in the shifting conditions of Netherlands polities. Early in 1579, the Walloon provinces, incensed at the aggressiveness of the Flemish Calvinists, had deserted the national cause and at Arras had made their peace with the king's new governor, the duke of Parma, who could now from that foothold in the south set about re-conquering the rest of the Netherlands. Did not the event, which was followed by the loss of the north-eastern province of Groningen, go

to prove that the Calvinists were the only party who could be counted on to hold out against all the blandishments of Parma? When Orange tried once more to enlist the help of France, and the Catholic duke of Anjou was clothed with the sovereignty of the Netherlands from which in 1581 the States-General solemnly deposed Philip II., the prince's particular connection with the two maritime provinces was expressly safeguarded. And however earnestly he deplored and tried to restrain the intolerant fanaticism of the Calvinists in Flanders and Brabant, all the time he saw himself forced underhand to work with them, thereby adding to the grievances of the Catholics, although at the same time Calvinist ministers denounced him as a godless timeserver.

The last years of William the Silent's life were a tragic struggle against overpowering circumstances. The unity of the Netherlands was broken beyond repair, and the area supporting the national cause kept crumbling away. The States-General had to leave Brussels in 1578, they stayed at Antwerp for a short while, then moved behind the waters to Middelburg, and finally to Delft, where William the Silent resided from 1583 onwards. His main efforts throughout those years were directed towards preserving the southern provinces, until then the principal provinces of the Netherlands, and of which Brabant had such close associations with him personally, and towards obtaining foreign help. The conclusion of the Union of Utrecht in 1579 met with his disapproval, as it seemed to be, on the part of the more easily defensible regions north of the rivers, an abandonment of the wider union of the Pacification. He had soon, nevertheless, to fall back upon it, and then did his best to make it comprehensive, nor were his efforts without success, for in the course of that year and the next all the towns of Flanders and several of those of Brabant entered it.

In 1581 Philip II. had promulgated a ban against William of Orange, by which a high reward was promised to anyone who would deliver the world of this traitor. A year later a serious attempt was made on his life, but it was only in 1584 that the ban achieved its purpose. On July 9, Balthazar Gérard, a Burgundian, shot the prince at Delft. William was 51 years of age.

Some years after the prince's death, owing to the assistance given by England and to Philip's injudicious interference in the French civil war, the turn came in the tide of Netherlands affairs, and although of the country south of the rivers little was recovered, at least the country north of them was secured and blossomed out into the republic of the Seven United Provinces. Of that state William the Silent is truly called the father. Yet it should not be forgotten that this was not the object which he had in view and that the split of the Netherlands means that his life's work was not accomplished. Apart from his success and failure in Netherlands politics, William the Silent will always be honoured as a man who nobly struggled and suffered for the cause of liberty of conscience. His personality, genial and humane, was fully worthy of the great part he played. There is something exceptionally attractive in his evolution from a frivolous courtier into the frugal and hard-working leader of a seemingly hopeless revolt, harassed but patient, courageous in the face of accumulating disaster, while the steadfastness with which at a time of furious religious fanaticism he preached moderation and forbearance has a heroic quality that is not disposed of by observing that his outlook was secular. His correspondence proves that in his later years religion was a real thing to him, and his attachment to the Reformed Church was sincere.

WILLIAM II. (1626–1650), prince of Orange, born at The Hague on May 27, 1626, was the son of Frederick Henry, prince of Orange, and his wife Amalia von Solms, and grandson of William the Silent. By the act of survivance passed in 1631 the offices and dignities held by Frederick Henry were made hereditary in his family. On May 12, 1641 William married, in the royal chapel at Whitehall, Mary, princess royal of England, eldest daughter of King Charles I. At the time of the wedding the bridegroom was not yet fifteen years old, the bride was five years younger. William from his early youth accompanied his father in his campaigns, and already in 1643 highly distinguished himself in a brilliant cavalry fight at Burgerhout (Sept. 5). On the death of Frederick Henry William succeeded him. At the moment of his accession to power the negotiations for a separate treaty of peace with Spain were almost concluded, and peace was actually signed at Münster on Jan. 30, 1648. By this treaty Spain recognized the independence of the United Netherlands and made large concessions to the Dutch. William did his utmost to prevent the ratification, but failed. He opened secret negotiations with France in the hope of securing the armed assistance for a war of aggrandisement against the Spanish Netherlands and of a restoration of his brother-in-law, Charles II., to the throne of England. The states of Holland, on the other hand, were determined to thwart any attempts for a renewal of war, and insisted, in defiance of the authority of the captain-general supported by the states-general, in virtue of their claim to be a sovereign province, in disbanding a large part of the regiments in their pay.

A prolonged controversy arose, which ended in the states-general in June 1650 commissioning the prince of Orange to visit the towns of Holland and secure a recognition of their authority. The mission was unsuccessful. Amsterdam refused any hearing at all. William resolved therefore to use force and crush resistance. On July 30 six leading members of the states of Holland were seized and imprisoned in the castle of Loevestein. On the same day an attempt was made to occupy Amsterdam with troops. The citizens were, however, warned in time, and the gates closed. William's triumph was nevertheless complete. The states of Holland submitted. The prince entered into fresh negotiations with the French government, and a draft treaty was drawn up. But William died of small-pox on Nov. 6, 1650. A week after his death his widow gave birth to a son, who was one day to become William III., king of England.

WILLIAM IV., landgrave of Hesse (1532–1592), was the son and successor of the landgrave Philip the Magnanimous. He took a leading part in safeguarding the results of the Reformation, endeavouring to unite all sections of Protestantism against the Catholic reaction. As ruler he displayed common-sense and tolerance; patronized art and science; placed the finances of his country on a sound basis and secured it against subdivision by a law of primogeniture. He was chiefly famous, however, as a pioneer in astronomical research.

See R. Wolf, "Astronomische Mittheilungen," No. 45 (*Vierteljahrsschrift der naturforschenden Gesellschaft in Zürich,* 1878).

WILLIAM [Frederick Henry], Prince of Wied (1876–), born at Neuwied on March 26, 1876, was 3rd son of William Prince of Wied and Mary Princess of Holland, grand-nephew of the emperor William I. and nephew of Queen Elizabeth of Rumania. An able soldier, he became a captain of the general staff in 1911, and in 1913 commanded a squadron of the 3rd Uhlans of the Guards. He married in 1906 Sophie, Princess of Schoenburg-Waldenburg, and had two children, Princess Marie Eleonor (1909) and Prince Charles Victor (1913). In Feb. 1914, inspired by idealism rather than ambition, he accepted the Albanian throne against the Kaiser's advice, and landed on March 7. Italy, France, Russia, Greece, Montenegro, Serbia, Turkey and Essad Pasha intrigued against him. Essad possessed troops, and the Mbreti (King), who had none, felt obliged to conciliate him with the Ministries of War and Interior. While the Greeks ravaged southern Albania an insurrection confined the Mbreti to Durazzo Essad was exiled in May; but foreign agents, protected by the Capitulations, paralysed the royalists. In Aug. 1914 Austria abandoned him because he determined to preserve neutrality. Besieged, and without resources, he reluctantly left Albania on Sept. 3. He did not abdicate. Early in 1915 the insurgents, finding they had been victims of intrigue, asked him to return, but this Austria prevented. He was attached as an Albanian and foreigner to a German divisional staff in Poland during the World War. On the accession of Ahmed Zogu in 1928 Prince William declared that he would not return unless unanimously invited. (J. Sw.)

WILLIAM OF MALMESBURY (*c.* 1080–*c.* 1143), English historian of the 12th century, was born about the year 1080, in the south country. He was a monk of Malmesbury, and assisted Abbot Godfrey (1081–1105) in collecting a library for the use of the community. The education which he received at Malmesbury included a smattering of logic and physics; but his principal studies were on moral philosophy and history. He made a collection of the histories of foreign countries, and decided to write a popular account of English history, modelled on the great work of Bede. William produced about 1120 the first edition of his *Gesta regum,* followed by the first edition of the *Gesta pontificum* (1125). A second edition of the *Gesta regum* (1127) was dedicated to Earl Robert of Gloucester; another patron was Bishop Roger of Salisbury. He was offered the abbacy of Malmesbury in 1140, but he preferred to remain a simple *bibliothecarius.* His one public appearance was made at the council of Winchester (1141), in which the clergy declared for the empress Matilda. About this date he undertook to write the *Historia novella,* giving an account of events since 1125. This work breaks off abruptly at the end of 1142.

William is the best English historian of his time. His contempt for the annalistic form makes him at times careless in his chronology and arbitrary in his method of arranging his material; but he is, however, an authority from 1066 onwards; many telling anecdotes, many shrewd judgments on persons and events, are found in his pages.

The standard edition of the *Gesta regum* and the *Historia novella* is that of W. Stubbs in the "Rolls" series (1 vol., in 2, 1887–89); the second part contains a valuable introduction on the sources and value of the chronicler. The *Gesta pontificum* was edited for the "Rolls" series by N. G. S. A. Hamilton (London, 1870) from a manuscript which he was the first to identify as the archetype. Another work, *De antiquitate Glastoniensis ecclesiae* (A.D. 63–1126), is printed in Gale's *Scriptores XV.* (Oxford, 1691). Wharton in the second volume of his *Anglia sacra* (London, 1691) gives considerable portions of a life of Wulfstan which is an amplified translation of an Anglo-Saxon biography. Finally Stubbs in his *Memorials of St. Dunstan* ("Rolls" series, London, 1874) prints a *Vita S. Dunstani* which was written about 1126.

WILLIAM OF NEWBURGH (d. *c.* 1198), or, as he is sometimes styled, Guilielmus Parvus, English ecclesiastic and chronicler, was a canon of the Augustinian priory of Newburgh in the North Riding of Yorkshire. He was born about 1136, and lived at Newburgh from his boyhood. Shortly before 1196 he began his *Historia rerum Anglicarum.* This work, divided into five books, covers the period 1066–1198. A great part of it is derived from known sources, especially from Henry of Huntingdon, Jordan Fantosme, the *Itinerarium regis Ricardi,* or its French original, and a lost account, by Anselm the chaplain, of the captivity of Richard I. The value of Newburgh's work lies in his estimates of men and situations. His political insight and his impartiality entitle him to a high place among the historians of the 12th century.

See the editions of the *Historia* by H. C. Hamilton (2 vols., 1856) and by R. Howlett in *Chronicles of the Reigns of Stephen, etc.* ("Rolls" series, 1884–85), vols. i. and ii. In the latter edition a continuation, the *Annales Furnesienses* (1190–1298), composed by a monk of Furness Abbey, Lancashire, is also given. *See* also Sir T. D. Hardy's *Descriptive Catalogue* ("Rolls" series, 1865), ii. p. 512; and H. E. Salter in the *English Historical Review,* vol. xxii. (1907).

(H. W. C. D.)

WILLIAM OF POITIERS (*c.* 1020–*c.* 1090), Norman chronicler, was born at Préaux, near Pont Audemer, and became chaplain to Duke William (William the Conqueror) and archdeacon of Lisieux. He wrote an eulogistic life of the duke, the earlier and concluding parts of which are lost; and Ordericus Vitalis, who gives a short biography of him in his *Historia ecclesiastica,* says that he also wrote verses. William's *Gesta Guilelmi II. ducis Normannorum,* the extant part of which covers the period between 1047 and 1068, is valuable for details of the Conqueror's life, although untrustworthy with regard to affairs in England.

The *Gesta* was first published by A. Duchesne in the *Historiae Normannorum scriptores* (1619); and it is also found in the *Scriptores rerum gestarum Willelmi Conquestoris* of J. A. Giles (London, 1845). There is a French translation in tome xxix. of Guizot's *Collection des mémoires relatifs à l'histoire de France* (1826). *See* G. Körting, *Wilhelms von Poitiers Gesta Guilelmi ducis* (Dresden, 1875); and A. Molinier, *Les Sources de l'histoire de France,* tome iii. (1903).

WILLIAM OF ST. CALAIS (CARILEF) (d. 1096), bishop of Durham and chief counsellor of William Rufus, a Norman monk and prior of St. Calais in Maine, received the see of Durham from the Conqueror (1081). He is remembered as the prelate who designed the existing cathedral, and for his reform of ecclesiastical discipline. His political career is less creditable. He died in Jan. 1096.

See E. A. Freeman, *William Rufus* (1882), and *Symeon of Durham,* vol. i., pp. 170–195 (Rolls ed.).

WILLIAM OF VALENCE (d. 1296), brother of Henry III. of England, was a son of John's widow, Isabelle of Angoulême, by her second marriage. William came to England with his brothers in 1247, and at once became a court favourite. He married Joan de Munchensi, the heiress to the Pembroke estates, whence he is sometimes styled earl of Pembroke. In 1258 he was attacked by the baronial opposition and forced to leave England. He returned in 1261, after Henry III. had repudiated the Provisions of Oxford, and fought on the royal side at Lewes (1264). Escaping from the pursuit of the victorious Montfortians, he later appeared at the head of a small army in Pembrokeshire. This gave the signal for the outbreak of a new civil war which ended with the defeat of Montfort at Evesham (1265). Valence accompanied Prince Edward to the Holy Land and, in later years, became a trusted agent of the crown, especially in the Welsh wars. The position of his estates made him the natural leader of all expeditions undertaken against Llewelyn from South Wales. He was also employed in Aquitaine. He died at Bayonne in 1296.

See R. Pauli's *Geschichte von England,* vol. iii. (Hamburg, 1853); W. H. Blaauw, *Barons' War* (1871).

WILLIAM OF WYKEHAM (1323?–1404), English lord chancellor and bishop of Winchester. William Wykeham was born at Wickham, Hants, in 1323 or 1324, son of John, whose name was probably Wykeham, but nicknamed Long. He was educated at Winchester, probably at the grammar school there, and became undernotary to the constable of Winchester castle, probably Robert of Popham, who was appointed in 1340. He was transferred to the king's court in 1343. In 1350 he appears to have been keeper of the manor of Rochford, Hants. His name appears in various other transactions in the county during the next few years; in 1356 he is first recorded as being directly employed by the king as clerk of the works to the manors of Henley and Easthampstead. In October he was appointed to the same office at Windsor, which he held until 1361.

Wykeham was already receiving wages as king's clerk in 1357, and he was richly rewarded for his various services by a series of benefices. He received the rectory of Pulham, Norfolk, in 1357, a canonry and prebend at Lichfield in 1359, though he did not obtain actual possession in either case without a struggle. In 1359 also, after the French raid on Winchelsea, he was placed in charge of the repair of the castles on the Kent coast and of many manors.

Meanwhile he had been appointed a clerk of the exchequer (Oct. 1361) and keeper of the forests south of the Trent. In 1364 he became privy seal. On Oct. 13, 1366, Wykeham was named bishop of Winchester. He was consecrated in Oct. 1367, and enthroned in 1368. Meanwhile he had been made (Sept. 17, 1367), chancellor of the kingdom. Parliament was inclined to lay the blame of the disasters of the French war on the clerical advisers of the Crown, and in 1372 Wykeham resigned the chancellorship.

Wykeham must have amassed a large fortune by his various employments and benefices; his application of that fortune has made him revered by successive generations of "Wykehamists." He began buying lands for the endowment of his great foundations of Winchester college, Winchester, and of New college, Oxford, in 1367. In 1373 he entered into an agreement with the master, Richard of Herton, "Grammaticus," for ten years faithfully to teach and instruct the poor scholars whom the bishop maintained at his own cost, in the art of grammar, and to provide an usher to help him. He was diverted from his foundations by public affairs, being named by the Commons one of the eight peers to discuss with them the state of the realm.

Lord Latimer and Alice Perrers, the king's mistress, were impeached (1376), and Wykeham took a leading part against Latimer. At the dissolution of parliament a council of nine, of whom Wykeham was one, was appointed to assist the king. But on June 8, the Black Prince died. Alice Perrers returned. John of Gaunt called a council (Oct. 16) to impeach Wykeham on articles which alleged misapplication of the revenues, oppressive fines on the leaders of the free companies, taking bribes for the release of the royal French prisoners, especially of the duke of Bourbon, who helped to make him bishop, failing to send relief to Ponthieu and making illegal profits by buying up Crown debts cheap. He was condemned on one only, that of halving a fine of £80 paid by Sir John Grey of Rotherfield for licence to alienate lands, and tampering with the rolls of chancery to conceal the transaction. Wykeham's answer was that he had reduced the fine because it was too large, and that he had received nothing for doing so. Skipworth, a judge of the common pleas, cited a statute under which for any erasure in the rolls to the deceit of the king 100 marks fine was imposed for every penny, and so Wykeham owed 960,000 marks. Wykeham was convicted, his revenues were seized and bestowed (1377) on the young prince Richard.

On June 21, 1377, Edward III. died. Wykeham received full pardon, and at once took an active part in the financial affairs of the new king, giving security for his debts and himself lending 500 marks, afterwards secured on the customs (Pat. 4 Rich. II. pt. i. m. 4). He then set to work to buy endowments for Winchester and New colleges. On Nov. 26 he issued his charter of foundation of "Seynt Marie College of Wynchestre in Oxenford" for a warden and 70 scholars to study theology, canon and civil law and arts, who were temporarily housed in various old halls. On March 5, 1380, the first stone was laid of the present buildings, which were entered on by the college on April 14, 1386. The foundation of Winchester was begun with a bull of Pope Urban VI. on June 1, 1378, enabling Wykeham to found "a certain college he proposed to establish for 70 poor scholars, clerks, who should live college-wise and study in grammaticals near the city of Winchester," and appropriate to it Downton rectory, one of the richest livings belonging to his bishopric. The bull says that the bishop "had, as he asserts, for several years administered the necessaries of life to scholars studying grammar in the same city." On Oct. 20, 1382, "Seinte Marie College of Wynchestre by Wynchestre" was founded for a warden and "70 pore and needy scholars studying and becoming proficient in grammaticals or the art and science of grammar." The first stone of the buildings was laid on March 26, 1388, and they were entered by the scholars on March 28, 1394, not, as supposed at the quincentenary celebration in 1893, in 1393. While the new buildings were being erected, the college remained in the parish of "St. John the Baptist on the Hill" of St. Giles, supplying scholars to New college then as since. The foundation was on the model of Merton and Queen's colleges at Oxford, to which grammar schools were attached by their founders, while fellows of Merton were the first wardens of both of Wykeham's colleges. The severance of the school which was to feed the college exclusively, placing it not at Oxford, but at Winchester, and constituting it a separate college, was a new departure of great importance in the history of English education. Ten fellows and 16 choristers were added in 1394 to the 70 scholars, the choristers attending the school like the scholars, and being generally, during the first three centuries of the foundation, promoted to be scholars. The original statutes have not come down to us. Those which governed the colleges until 1857 were made in 1400. They state that the colleges were provided to repair the ravages caused by the Black Death in the ranks of the clergy, and for the benefit of those whose parents could not without help maintain them at the universities.

The time which elapsed between the foundation and completion of the colleges may be attributed to Wykeham's preoccupation with politics in the disturbed state of affairs, due to the papal schism begun in 1379, in which England adhered to Urban VI. and France to Clement VII., to the rising of the Commons in 1381, and the wars with France, Scotland and Spain during John of Gaunt's ascendancy. Then followed the constitutional revolution of the lords appellant in 1388. When Richard II. took power on himself on May 3, 1389, he at once made Wykeham chancellor, with Brantingham of Exeter again as treasurer.

On Sept. 27, 1391, Wykeham finally resigned the chancellorship. For three years after there are no minutes of the council. On Nov. 24, 1394, Wykeham lent the king the sum of £1,000 (equivalent to £30,000 now), which same sum or another £1,000 he promised on Feb. 21, 1395, to repay by midsummer, and did so (Pat. 18, Rich. II. pt. ii. m. 23, 41). Wykeham was clearly against the assumption by Richard of absolute power. He excused himself from convocation in 1397, and from the subservient parliament at Shrewsbury in 1398. Possibly he took part in the revolution of Henry IV. He appeared in the privy council four times at the beginning of Henry's reign (*Proc. P.C.* i. 100). There are records of loans by him to Henry IV. in the first years of his reign. Meanwhile, on Sept. 29, 1394, he had begun the recasting of the nave of the cathedral with William Wynford, the architect of the college, as chief mason, and Simon Membury, an old Wykehamist, as clerk of the works. He died on Sept. 27, 1404, aged 80.

His effigy in the cathedral chantry and a bust on the groining of the muniment tower at Winchester college are no doubt authentic portraits. The pictures at Winchester and New college are late 16th-century productions. Three autograph letters of his, all in French, and of the years 1364–66, are preserved, one at the British Museum, one at the Record Office, a third at New college, Oxford.

Leach, *History of Winchester College* (1899); and the *Calendars of Patent and Close Rolls, Edward III. and Richard II.*

WILLIAMS, JOHN (1582–1650), English archbishop and lord keeper, son of Edmund Williams of Conway, was born in March 1582 and educated at St. John's College, Cambridge. He received rapid promotion in the Church, and, on the fall of Bacon (1621), was appointed lord keeper, and was at the same time made bishop of Lincoln, retaining also the deanery of Westminster. Williams took the popular side in condemning arbitrary imprisonment by the sovereign. A case was preferred against him in the Star Chamber of revealing state secrets, to which was added in 1635 a charge of subornation of perjury, of which he had undoubtedly been guilty and for which he was condemned in 1637 to pay a fine of £10,000, to be deprived of the temporalities of all his benefices, and to be imprisoned during the king's pleasure. He was sent to the Tower. In 1639 he was again condemned by the Star Chamber for libelling Laud, a further heavy fine being imposed for this offence. In 1641 he recovered his liberty on the demand of the House of Lords, who maintained that as a peer he was entitled to be summoned to parliament. In December 1641 the king, anxious to conciliate public opinion, appointed Williams archbishop of York. In the same month he was one of the twelve bishops impeached by the Commons for high treason and committed to the Tower. Released on an undertaking not to go to Yorkshire, a promise which he did not observe, the archbishop was enthroned in York Minster in June 1642. On the outbreak of the Civil War, after visiting Conway in the Royalist interest, he joined the king at Oxford; he then returned to Wales, and finding that Sir John Owen, acting on Charles's orders, had seized certain property in Conway Castle that had been deposited with the archbishop for safe-keeping, he went over to the Parliamentary side and assisted in the recapture of Conway Castle in November 1646. Williams, who was a generous benefactor of St. John's College, Cambridge, died on March 25, 1650.

WILLIAMS, JOHN (1796–1839), English Nonconformist missionary, was born at Tottenham near London on June 29, 1796. He was sent by the London Missionary Society in 1816 to Eimeo, in the Society Islands, where he rapidly acquired a knowledge of the native language. After staying there for a short time, he finally settled at Raiatea, which became his permanent headquarters. His success was remarkable. The people rapidly became Christianized and adopted many of the habits of civilization. Williams

travelled unceasingly among the various island groups, planting stations and settling native missionaries whom he himself had trained. From the Society Islands he visited the Hervey group, where he discovered, and stayed for a considerable time on, the island of Rarotonga. Besides establishing Christianity and civilization among the people, he also, at their own request, helped them to draw up a code of laws for civil administration upon the basis of the new religion. While at Rarotonga he, with the help of the natives, built himself a 60-ft. ship, "The Messenger of Peace," within about four months; with this he returned to Raiatea, and made voyages among other island groups, including Samoa and the neighbouring islands. Williams returned to England in 1834 (having previously visited New South Wales in 1821); and during his four years' stay at home he had the New Testament, which he had translated into Rarotongan, printed. Returning in 1838 to the Pacific, he visited the stations already established by him, as well as several fresh groups. He went as far west as the New Hebrides, and, while visiting Eromanga, one of the group, was murdered by cannibal natives Nov. 20, 1839.

His *Narrative of Missionary Enterprises in the South Sea Islands* was published in 1837, and formed an important contribution to our knowledge of the islands with which the author was acquainted. See *Memoir of John Williams*, by Ebenezer Prout (London, 1843); C. S. Horne, *The Story of the L.M.S.* (1908), pp. 41–54.

WILLIAMS, ROGER (*c.* 1604–1684), founder of the Colony of Rhode Island in America and pioneer of religious liberty, son of a merchant tailor, was born about 1604 in London. It seems reasonably certain that he was educated, under the patronage of Sir Edward Coke, at the Charter House and at Pembroke college, Cambridge, where he received his degree in 1627. He devoted himself to theology, and in 1629 was chaplain to Sir William Masham of Otes, High Laver, Essex, but from conscientious scruples, in view of the condition of ecclesiastical affairs in England at the time, refused preferment. He soon decided to emigrate to New England, and, with his wife Mary, arrived at Boston early in Feb. 1631. In April he became teacher of the church at Salem, Mass.

Owing to the opposition of the ecclesiastical authorities at Boston, with whose views his own were not in accord, he removed to Plymouth in the summer, and there remained for two years as assistant pastor. In Aug. 1633, he again became teacher at Salem. Here he incurred the hostility of the authorities of the Massachusetts Bay Colony by asserting, among other things, that the civil power of a State could properly have no jurisdiction over the consciences of men, that the King's patent conveyed no just title to the land of the colonists, which should be bought from its rightful owners, the Indians, and that a magistrate should not tender an oath to an unregenerate man, an oath being, in reality, a form of worship. For the expression of these opinions he was formally tried in July 1635 by the Massachusetts general court, and at the next meeting of the general court in October, he not having taken advantage of the opportunity given to him to recant, a sentence of banishment was passed upon him, and he was ordered to leave the jurisdiction of Massachusetts within six weeks. The time was subsequently extended, conditionally, but in Jan. 1636, an attempt was made to seize him and transport him to England. Forewarned, he escaped and proceeded alone to Manton's Neck.

At the instance of the authorities at Plymouth, within whose jurisdiction Manton's Neck was included, Williams, with four companions, who had joined him, founded in June 1636 the first settlement in Rhode Island, to which, in remembrance of "God's merciful providence to him in his distress," he gave the name *Providence*. He immediately established friendly relations with the Indians in the vicinity, whose language he had learned, and, in accordance with his principles, bought the land upon which he had settled from the sachems Canonicus (*c.* 1565–1647) and Miantonomo. His influence with the Indians, and their implicit confidence in him, enabled him in 1636, soon after arriving at Providence, to induce the Narragansetts to ally themselves with the Massachusetts colonists at the time of the Pequot War, and thus to render a most effective service to those who had driven him from their community. Williams and his companions founded their new settlement upon the basis of complete religious toleration, with a view to its becoming "a shelter for persons distressed for conscience." (*See* RHODE ISLAND.) Many settlers came from Massachusetts and elsewhere, among others some Anabaptists, by one of whom in 1639 Williams was baptized, he baptizing others in turn and thus establishing what has been considered the first Baptist Church in America. Williams, however, maintained his connection with this church for only three or four months, and then became what was known as a "Seeker," or Independent.

In 1643 he went to England, and there in 1644 obtained a charter for Providence, Newport and Portsmouth, under the title "The Providence Plantations in the Narragansett Bay." He returned to Providence in the autumn of 1644 and in 1646 removed from Providence to a place now known as Wickford, R.I. He was president, or governor, in 1654–57, and an assistant in 1664, 1667 and 1670. In 1651, with John Clarke (1609–66), he went to England to secure the issue of a new and more explicit charter. He returned in the summer of 1654, having enjoyed the friendship of Cromwell, Milton and other prominent Puritans. Williams died at Providence in March 1684; the exact date is unknown.

Williams was a vigorous controversialist, and published, chiefly during his two visits to England, *A Key into the Language of the Indians of America*, written at sea on his first voyage to England (1643); reprinted in vol. i. of the *Collections of the Rhode Island Historical Society* (1827), and in series i. vol. iii. of the *Massachusetts Historical Society Collections*; *Mr. Cotton's Letter Examined and Answered* (1644); *The Bloudy Tenent of Persecution for the Cause of Conscience* (1644); *Christenings make not Christians* (1645); *Queries of Highest Consideration* (1644); *The Bloudy Tenent yet more Bloudy* (1652); *Experiments of Spiritual Life and Health and Their Preservatives* (1652); *The Hireling Ministry none of Christ's* (1652); and *George Fox Digged out of his Burrowes* (1676); *Something in answer to a Letter . . . of John Leverat Governor of Boston . . .* (1678).

His writings were republished in the *Publications of the Narragansett Club* (Providence 1866–74). *Letters and Papers of Roger Williams, 1629–82* (limited to 18 copies, photostatic reproductions, Boston, 1924) contained manuscripts discovered since. The best biographies are those by Oscar Straus (1899) and E. J. Carpenter (1910). *See* also J. D. Knowles, *Memoir of Roger Williams* (Boston 1834); Elton, *Life of Roger Williams* (London 1852; Providence 1853); A. B. Strickland, *Roger Williams, Prophet and Pioneer of Soul Liberty* (1919); *New England Hist. and Gen. Register*, July and Oct. 1889, and Jan. 1899; M. C. Tyler, *History of American Literature, 1607–1765* (1878). "Letters, concerning Colonial History of Rhode Island," written by Benedict Arnold, Roger Williams and others, *Newport Hist. Soc. Bull.* (1926). For the best apology for his expulsion from Massachusetts, *see* H. M. Dexter's, *As to Roger Williams and his "Banishment" from the Massachusetts Plantation* (Boston, 1876), an unsuccessful attempt to prevent Massachusetts from revoking the order of banishment.

WILLIAMSBURG, a city of south-eastern Virginia, U.S.A., the county seat of James City county; on the peninsula between the James and the York rivers, 45 m. S.E. of Richmond. It is on Federal highway 60 and the Chesapeake and Ohio railway. Pop. 2,462 in 1920. It is the seat of the College of William and Mary, founded in 1693 "to the end that the Church of Virginia may be furnished with a seminary of ministers of the gospel" and the Eastern State Hospital for the Insane (1773) and the centre of many historic associations. Bruton parish church (the second building of a parish organized in 1674), completed in 1717, enlarged in 1752 and restored 1905–07, is the oldest church in America which has been continuously in use. The powder magazine (built in 1714) from which Lord Dunmore removed the powder on the day after the battle of Lexington, has been preserved. The court-house dates from 1769. The colonial residences include the Peyton Randolph house and the George Wythe house, which was Washington's headquarters during the siege of Yorktown. Williamsburg, originally called Middle Plantation, from its position between the two rivers, was founded in 1632. A wall was built around it, and for several years it served as a refuge from Indian attacks. Here on Aug. 3, 1676, Nathaniel Bacon held his "rebel" assembly and in Jan. 1677, two of the "rebels" were hanged. In 1698 Middle Plantation was made the capital of the province, in 1699 it was renamed in honour of William III. and in 1722 it was chartered as a city. The *Virginia Gazette*, the first newspaper published in the South, was established here in 1736. In the capitol on May 30, 1765, Patrick Henry presented his historic resolutions and made his

famous speech against the Stamp Act, and on May 15, 1776, the Virginia Convention passed resolutions urging the Continental Congress to declare for independence. In 1779 the seat of the State government was moved to Richmond, and in 1832 fire destroyed the old capitol.

The battle of Williamsburg in the Civil War was an attack (May 5, 1862) by a Union division on a part of the Confederate army in retreat from Yorktown toward Richmond, and resulted in heavy losses on both sides. A project was under way in 1928 (on the initiative and under the direction of the Rev. W. A. R. Goodwin, who restored Old Bruton church) for restoring the entire colonial area of the city to its 18th century aspect. The plans contemplate the preservation of 60 or 70 colonial houses and perhaps 50 others not too discordant in character, and the destruction of about 100 of more modern construction, including a large new brick school and a church. By the beginning of 1928 considerable funds had been raised by Dr. Goodwin's committee; the necessary legislative authority had been secured for including the public squares and streets in the scheme; and about $2,000,000 had been spent in acquiring title to private property. Since then a contribution of $5,000,000 towards the expense has been made by John D. Rockefeller, Jr. When complete, the restored area will constitute a colonial museum a mile square.

WILLIAMSON, ALEXANDER WILLIAM (1824–1904), English chemist, was born at Wandsworth, London, on May 1, 1824. He first studied medicine, but whilst at Heidelberg he became interested in L. Gmelin's work, and decided to take up chemistry; in 1844 he went to Giessen and worked under Liebig and Bischoff. In 1849 he was appointed professor of practical chemistry at University college, London, and from 1855, when Graham resigned, until his retirement in 1887, he also occupied the chair of chemistry. He was elected a fellow of the Royal Society in 1855 and awarded a Royal medal in 1862. He died on May 6, 1904, at Hindhead, Surrey.

Williamson's earliest work (1844) was on the decomposition of oxides and salts by chlorine, and in this he threw considerable light on the action of chlorine on bases; shortly afterwards he published papers on ozone, and on the composition of Prussian blue. His most famous work was, however, done during his first few years at University college, and dealt with the problem of etherification. In the course of this work he definitely settled the vexed problem of the relationship of alcohol, ether and water. He suggested that alcohols, ethers, acids and their derivatives all belong to the "water type" of compound, and thus attempted to introduce a unifying principle into this aspect of organic chemistry. In the course of his work Williamson established the molecular formulae of alcohol and ether, and in this way he helped in the revival of Avogadro's hypothesis, which had lain dormant since 1811, and confirmed the views of Laurent and Gerhardt on atoms and molecules. Various aspects of Williamson's work on etherification helped in the development of structural organic chemistry, and although he made no direct contribution to the modern side of the subject, yet his investigations helped very materially to bring about a more definite conception of the constitution of organic compounds. In the course of his researches he prepared the first mixed ether (methyl ethyl ether) and, with Kay, he synthesized ethylene glycol (1854). Williamson, in his papers explains the action of sulphuric acid in the production of ether from alcohol by saying that an intermediate compound of the acid and alcohol—ethyl sulphuric acid—is first formed, and this reacts with more alcohol to regenerate the acid and liberate ether and water. This is the first recorded instance of the explanation of catalysis by what has become known as the "intermediate compound" theory.

His papers on *Etherification and the Constitution of Salts* were reprinted by the Alembic Club (Edinburgh, 1902). *See* obituary notice, *Proc. Roy. Soc.* (1907); and Sir W. Tilden, *Famous Chemists* (1921).

WILLIAMSON, a city of West Virginia, U.S.A., the county seat of Mingo county; on the Big Sandy river (the south-western boundary of the State) and the Norfolk and Western railway. Pop. 6,819 in 1920 (17% negroes); estimated locally at 13,000 in 1928. It is a coal-mining centre and the trading and supply point for other mining towns and camps. The county mined 6,458,898 tons of coal in 1926. This region is one of the "non-union" areas of the bituminous coal-fields, where conflict between the companies and union sympathizers and organizers resulted in serious civic disturbances in 1920–21. The city was founded in 1895 and incorporated in 1896.

WILLIAMSPORT, a city of central Pennsylvania, U.S.A., the county seat of Lycoming county; on the north bank of the west branch of the Susquehanna river, 70 m. N. by W. of Harrisburg. It is on Federal highways 111 and 220, and is served by the New York Central, the Pennsylvania and the Reading railways, and motor-bus lines. Pop. (1920) 36,198 (91% native white); 1928 local estimate (after annexations of territory, and including part of the contiguous township of Loyalsock) 44,500. The city is well placed on a high plain, nearly surrounded by hills, and there is much beautiful scenery in the vicinity. It is the metropolis of a large area, a centre for tourists, and a manufacturing city with some 85 diversified industries, producing goods valued in 1925 at $50,584,482. Bank debits in 1927 aggregated $249,492,000. Founded in 1795, the year in which Lycoming county was erected, it became the county seat after a bitter contest with Jaysburg, a village of half a dozen houses (subsequently abandoned). It was incorporated as a borough in 1806 and as a city in 1866. Until the surrounding timber was exhausted it was a one-industry town.

WILLIAMSTOWN, a town of Berkshire county, Massachusetts, U.S.A., on the Hoosic and the Green rivers, in the north-western corner of the State; served by the Boston and Maine railroad. Pop. (1925) 4,006 (State census). Williamstown village, on the Green river, surrounded by the Berkshire hills, its streets shaded with fine old trees, is a charming residential centre, without any factories. It is the seat of Williams college. Ephraim Williams, who was killed in the battle of Lake George on Sept. 8, 1755, left a small bequest for a free school, on condition that the town when incorporated should be named Williamstown. It was incorporated under that name in 1765. The Institute of Politics, a conference for the study of international relationships, has been held at the college each summer since 1921.

WILLIAMSTOWN (Victoria): *see* under Melbourne.

WILLIBRORD (or Wilbrord), **ST.** (d. 738), English missionary, "the apostle of the Frisians," was born about 657. His father, Wilgils, an Angle or, as Alcuin styles him, a Saxon, of Northumbria, withdrew from the world and constructed for himself a little oratory dedicated to St. Andrew. The king and nobles of the district endowed him with estates till he was at last able to build a church, over which Alcuin afterwards ruled. Willibrord, almost as soon as he was weaned, was sent to be brought up at Ripon, where he must doubtless have come under the influence of Wilfrid. About the age of twenty the desire of increasing his stock of knowledge (*c.* 679) drew him to Ireland, which had so long been the headquarters of learning in western Europe. Here he stayed for twelve years, enjoying the society of Ecgberht and Wihtberht. Ecgberht commissioned him as a missionary to the North-German tribes. In his thirty-third year (*c.* 690) he started with twelve companions for the mouth of the Rhine. These districts were then occupied by the Frisians under their king, Rathbod, who gave allegiance to Pippin of Herstal. Pippin befriended Willibrord and sent him to Rome, where he was consecrated archbishop (with the name Clemens) by Pope Sergius on St. Cecilia's Day 696. Bede says that when he returned to Frisia his see was fixed in Ultrajectum (Utrecht). He spent several years in founding churches and evangelizing, till his success tempted him to pass into other districts. From Denmark he carried away thirty boys to be brought up among the Franks. When Pippin died, Willibrord found a supporter in his son Charles Martel. He was assisted for three years in his missionary work by St. Boniface (719–722).

He was still living when Bede wrote in 731. A passage in one of Boniface's letters to Stephen III. speaks of his preaching to the Frisians for fifty years, apparently reckoning from the time of his consecration. This would fix the date of his death in 738; and, as Alcuin tells us he was eighty-one years old when he died, it may be inferred that he was born in 657—a theory on which

all the dates given above are based, though it must be added that they are substantially confirmed by the incidental notices of Bede. The day of his death was Nov. 6, and his body was buried in the monastery of Echternach, near Trier, which he had himself founded. Even in Alcuin's time miracles were reported to be still wrought at his tomb.

The chief authorities for Willibrord's life are Alcuin's *Vita Willibrordi*, both in prose and in verse, and Bede's *Hist. Eccl.* v. cc. 9–11. *See* also Eddius's *Vita Wilfridii* (1879; text trans. and notes by Colgrave, Cambridge, 1927); J. Mabillon, *Annales ordinis sancti Benedicti*, lib. xviii.; and *The Calendar of St. Willibrord*, edited by H. A. Nelson (1918).

WILLIMANTIC, a city of Windham county, Connecticut, U.S.A., 25 m. E.S.E. of Hartford, at the confluence of the Willimantic and the Natchaug rivers to form the Shetucket. It is served by the Central Vermont and the New York, New Haven and Hartford railways. Pop. (1920) 12,330 (26% foreign-born white); 1928 local estimate 13,500. There is abundant water-power, and the city has extensive manufactures of spool-cotton, silk twist, silk and cotton fabrics, velvet and other commodities, with an output in 1925 valued at $10,230,574. The town of Windham, in which Willimantic is situated, was incorporated in 1692. Willimantic was settled in 1822, incorporated as a borough in 1833 and chartered as a city in 1893. The name is of Indian derivation.

WILLIS, THOMAS (1621–1675), English anatomist and physician, was born at Great Bedwin, Wiltshire, on Jan. 27, 1621. In 1660 he became Sedleian professor of natural philosophy in place of Dr. Joshua Cross, who was ejected at the Restoration. He was one of the first members of the Royal Society, and was elected an honorary fellow of the Royal College of Physicians in 1664. He died in St. Martin's Lane, London, on Nov. 11, 1675.

Willis was admired for his piety and charity, for his deep insight into natural and experimental philosophy, anatomy and chemistry, and for the elegance and purity of his Latin style. His most important work is *Cerebri anatome nervorumque descriptio et usus* (1664), in which he described what is still known, in the anatomy of the brain, as the circle of Willis.

See Munk, *Roll of the Royal College of Physicians, London* (2nd ed., vol. i., 1878).

WILLISTON, SAMUEL WENDELL (1852–1918), American palaeontologist and entomologist, was born in Boston, Mass., on July 10, 1852. In 1857 his parents emigrated to Kansas, settling in Manhattan. Following his graduation at Kansas Agricultural college (B.S., 1872), he engaged in railway surveying, studied medicine, and became an ardent collector of vertebrate fossils in the chalk beds of western Kansas. In 1876 he was called to New Haven, Conn., by Dr. O. C. Marsh, professor of palaeontology at Yale university. Entering the department of palaeontology, Williston collaborated in extensive researches with Marsh until 1885, making also investigations in entomology and continuing medical and other studies (M.D., 1880; Ph.D., 1885). He was professor of anatomy at Yale, 1886–90; professor of geology at the University of Kansas, 1890–1902, and professor of vertebrate palaeontology at the University of Chicago from 1902 until his death at Chicago on Aug. 18, 1918.

While Williston's contributions to entomology were of a high order, especially his authoritative work on the Diptera, his pre-eminence in science rests upon his monumental researches in vertebrate palaeontology, notably on Cretaceous and Permian reptiles and amphibians, which take rank with those of Leidy, Cope, Marsh and Osborn among the American palaeontologists of his time. His published writings, comprising about 300 titles, include *Manual of North American Diptera* (3rd ed., 1908); *American Permian Vertebrates* (1911); *Water Reptiles of the Past and Present* (1914); and *The Osteology of Reptiles* (ed. by W. K. Gregory, 1925).

See the sketch by H. F. Osborn, *Jour. of Geol.*, vol. xxvi., pp. 673–689 (1918) and the memoir by R. S. Lull, *Mem. Nat. Acad. Sci.*, vol. xvii. (1924).

WILLISTON, a city of North Dakota, U.S.A., on the north bank of the Missouri river and the main line of the Great Northern railway, 20 m. from the western boundary of the State; the county seat of Williams county. Pop. (1925) 3,948.

WILLMAR, a city of Minnesota, U.S.A., 100 m. W. of Minneapolis, on Foot Lake; the county seat of Kandiyohi county and a gateway to the State's 10,000 lakes. It is on Federal highways 12, 212 and 71, and is served by the Great Northern railway. The population was 5,892 in 1920 (22% foreign-born white) and was estimated locally at 7,000 in 1928. It is a division point on the Great Northern, which has repair shops and foundries here; and the seat of the State Hospital for Inebriates. The city was founded in 1869 and incorporated in 1874.

WILLMORE, JAMES TIBBITTS (1800–1863), English line engraver, was born at Bristnall's End, Handsworth, near Birmingham, on Sept. 15, 1800. At the age of fourteen he was apprenticed to William Radcliffe, a Birmingham engraver, and in 1823 he went to London and was employed for three years by Charles Heath. He was afterwards engaged upon the plates of Brockedon's *Passes of the Alps* and Turner's *England and Wales*. He engraved after Chalon, Leitch, Stanfield, Landseer, Eastlake, Creswick and Ansdell, and especially after Turner, from whose "Alnwick Castle by Moonlight," "The Old Téméraire," "Mercury and Argus," and "Ancient Rome" he executed many admirable plates. He died on March 12, 1863.

WILLOBIE (or WILLOUGHBY), **HENRY** (1575?–1596?), the supposed author of a poem called *Willobie his Avisa*, which derives interest from its possible connection with Shakespeare's personal history. Henry Willoughby was the second son of a Wiltshire gentleman of the same name, and matriculated from St. John's college, Oxford, in Dec. 1591, at the age of sixteen. He is probably identical with the Henry Willoughby who graduated B.A. from Exeter college early in 1595, and he died before June 30, 1596, when to a new edition of the poem Hadrian Dorrell added an "Apologie" in defence of his friend the author "now of late gone to God," and another poem in praise of chastity written by Henry's brother, Thomas Willoughby. *Willobie his Avisa* was licensed for the press on Sept. 3, 1594, four months after the entry of Shakespeare's *Rape of Lucrece*, and printed by John Windet. It is preceded by two commendatory poems, the second of which, signed "Contraria Contrariis; Vigilantius; Dormitanus," contains the earliest known printed allusion to Shakespeare by name:—

> Yet Tarquyne pluckt his glistering grape,
> And Shake-speare paints poore Lucrece rape.

Dorrell alleges that he found the ms. of *Willobie his Avisa* among his friend's papers left in his charge when Willoughby departed from Oxford on her majesty's service. There is no trace of any Hadrian Dorrell, and the name is probably fictitious; there is, indeed, good reason to think that the pseudonym, if such it is, covers the personality of the real author of the work. *Willobie his Avisa* proved extremely popular.

See Shakspere Allusion-Books, part i., ed. C. M. Ingleby (New Shakspere Society, 1874); A. B. Grosart's "Introduction" to his reprint of *Willobie his Avisa* (1880).

WILL-O'-THE-WISP: *see* IGNIS FATUUS.

WILLOW (*Salix*), a well-marked genus of plants constituting, with the poplar (*Populus*), the family Salicaceae. Willows are trees or shrubs, varying in height from a few inches, like the small British *S. herbacea* and Arctic species generally, to 120 ft., and occurring most abundantly in cold or temperate climates in both hemispheres, and generally in moist situations. Their leaves are deciduous, alternate, simple, and generally much longer than broad, whence the term willow-leaved has become proverbial. At their base they are provided with stipules, which are also modified to form the scales investing the winter buds. The flowers are borne in catkins, which are on one tree male (staminate) only, on another female (pistillate). Each male flower is borne in the axil of a small scale or bract, and consists usually of two but sometimes of more stamens. In addition there are one or two small glandular organs, the nectaries. The female flowers are equally simple and also arise in the axil of a bract; they show a very short stalk, surmounted by two carpels adherent one to the other for their whole length, except that the upper ends of the styles are separated into two stigmas; nectaries are present in these flowers also. When ripe the two carpels separate in the form of two valves and liberate a large number of seeds, each provided

at the base with a tuft of silky hairs. The flowers appear generally before the leaves and are thus rendered more conspicuous, while transport of pollen by the wind is facilitated. Fertilization is effected by insects, especially by bees; but some pollen must also be transported by the wind to the female flowers, especially in Arctic species which, in spite of the poverty of insect life, set abundant fruit. The tuft of hairs at the base facilitates rapid dispersion of the seed.

Although the limitations of the genus are well marked, and its recognition in consequence easy, it is otherwise with regard to the species. The greatest difference of opinion exists among botanists as to their number and the bounds to be assigned to each; and the extensive cross-fertilization that takes place between the species, resulting in numerous hybrid forms, intensifies the difficulty. Andersson, a Swede, who spent nearly 25 years in their investigation, published a monograph on the genus. He admits about 100 species. C. S. Sargent (*Silva of North America*) suggested 160 to 170 as the number of distinguishable species. Some botanists have enumerated 80 species from Great Britain alone, while others count only 12 or 15. Buchanan White, who made a special study of the British willows, grouped them under 17 species with numerous varieties and hybrids. A new monograph on the genus by S. J. Evander, of Sweden, is shortly to appear.

As timber trees many of the species are valuable from their rapidity of growth and for the production of light durable wood, serviceable for many purposes. Among the best trees of this kind are *S. fragilis*, the crack willow, and *S. alba*, the white or Huntingdon willow. These trees are usually found growing by river banks or in other moist situations, and are generally pollarded for the purpose of securing a crop of straight poles. The wood of *S. alba* var. *caerulea* is used for cricket bats; there is a great difference in the value for this purpose of timber from different soils; and wood of the female tree is said to be preferable to that of the male. *S. Caprea*, a hedgerow tree, generally grows in drier situations. It is a useful timber tree, and its wood, like that of *S. alba*, is prized in the manufacture of charcoal. Its catkins are collected in England in celebration of Palm Sunday, the bright-coloured flowers being available in early spring. Certain sorts of willow are largely used for basket-making and wickerwork. The species employed for this purpose are known under the collective name of osiers. (*See* OSIER.) *S. acuminata* and other species do well by the seaside, and are serviceable as windscreens, nurse-trees and hedges. *S. daphnoides, S. repens* and other dwarf kinds are useful for binding heathy or sandy soil. In addition to their use for timber or basket-making, willows contain a large quantity of tannin in their bark. A medicinal glucoside named salicin (*q.v.*) is also extracted from the bark. The wood, especially of *S. alba*, is used for paper pulp. As ornamental trees some willows also take a high rank. The white willow is a great favourite, while the drooping habit of the weeping willow renders it very attractive. Though named *S. babylonica*, it is really a native of China, from which it has been widely spread by man; the willow of the Euphrates (Ps. cxxxvii.) is in all probability *Populus euphratica*. *S. regalis* has very white, silvery leaves. *S. rosmarinifolia* is remarkable for its very narrow leaves —purplish above, silvery beneath.

In North America upwards of 70 native species occur, together with numerous varieties and natural hybrid forms. Of these about 25 species attain the stature of trees. The black willow (*S. nigra*), the largest and most conspicuous willow of eastern North America, reaches a height of 120 ft., with a trunk 3 ft. in diameter. Other well-known willow trees found east of the Rocky Mountains are the peach-leaved willow (*S. amygdaloides*), sometimes 70 ft. high; the pussy willow (*S. discolor*), 10 ft. to 25 ft. high; the shining willow (*S. lucida*), occasionally 20 ft. high; the beaked willow (*S. Bebbii*), rarely 25 ft. high; and the sandbar willow (*S. longifolia*). Some of the foregoing range northward and westward to British Columbia, Alaska and the arctic circle. Interesting shrubby species found chiefly east of the Rocky Mountains are the autumn willow (*S. serissima*), with fruit maturing in the autumn; the broad-leaved willow (*S. glaucophylla*), found on sand dunes; the furry willow (*S. syrticola*), of lake and river shores; the silky willow (*S. sericea*), with silky leaves; the hoary willow (*S. candida*), with sage-like foliage; and the prairie willow (*S. humilis*) and the grey willow (*S. tristis*), both low slender shrubs.

Among noteworthy willows found in the Pacific States and northward are the western black willow (*S. lasiandra*), sometimes 45 ft. high; the red willow (*S. laevigata*), 20 ft. to 50 ft. high; the California white willow or arroyo willow (*S. lasiolepis*), 8 ft. to 20 ft. high; and the Sitka or velvet willow (*S. sitchensis*), sometimes 30 ft. high, which grows from California to Alaska.

Several Old World willows, widely planted for ornament and other purposes in eastern North America, have become extensively naturalized, especially the white willow (*S. alba*), the yellow willow (*S. vitellina*), the weeping willow (*S. babylonica*), the brittle or crack willow (*S. fragilis*), and the purple willow (*S. purpurea*). The basket willow (*S. viminalis*), the bay willow (*S. pentandra*) and the goat willow or sallow (*S. Caprea*) have become sparingly naturalized.

WILLOW-HERB, in botany, the popular name for the species of *Epilobium*, a genus (family Onagraceae) of often tall herbaceous plants, embracing upwards of 160 species, nine of which are natives of Great Britain. The slender stems bear narrow leaves and pink or purple flowers, which in the rose-bay (*E. angustifolium*), found by moist river-sides and in copses, are 1 in. in diameter and form showy spikes. The great hairy willow-herb, *E. hirsutum*, found by sides of ditches and rivers, a tall plant with many large rose-purple flowers, is known popularly as codlins-and-cream. In North America some 40 species of willow-herb are found, including *E. angustifolium*, which is native across the continent and called usually great willow-herb or fire-weed, and *E. hirsutum*, extensively naturalized in the eastern States and Canada.

WILLS, WILLIAM GORMAN (1828–1891), Irish dramatist, was born at Kilmurry, Ireland, on Jan. 28, 1828, the son of James Wills (1790–1868), author of *Lives of Illustrious and Distinguished Irishmen* (1839–47). The son was educated at Waterford grammar school and Trinity college, Dublin. Wills was a Dublin journalist, then a portrait-painter, and finally "dramatist to the Lyceum." He had written several plays under this agreement when he made a great success with *Charles I.* (1872) and with *Olivia* (1873), an adaptation of the *Vicar of Wakefield*. Wills also wrote ballads, the best known of which is "I'll sing thee songs of Araby." He died on Dec. 13, 1891.

See F. Wills, *William Gorman Wills* (1898).

WILLUGHBY, FRANCIS (1635–1672), English ornithologist and ichthyologist, son of Sir Francis Willughby, born at Middleton, Warwickshire, was the pupil, friend and patron as well as the active and original co-worker of John Ray (*q.v.*), and hence to be reckoned as one of the most important precursors of Linnaeus. His connection with Ray dated from his studies at Trinity College, Cambridge (1653–1659); and he made an extensive Continental tour in his company. The specimens, figures and notes thus accumulated were in great part elaborated on his return into his *Ornithologia*, posthumously published in 1676, and translated by Ray as the *Ornithology of Fr. Willughby* (London, 1678, fol.); the same friend published his *Historia Piscium* (1686, fol.). In Ray's preface to the former work he gives Willughby much of the credit usually assigned to himself, both as critic and systematist. Willughby died at Middleton Hall on July 3, 1672.

WILLY, the pen-name adopted by the French novelist HENRI GAUTHIER-VILLARS (1859–), born at Villars-sur-Orge, on Aug. 10, 1859. He was educated at the Lycée Condorcet and the Collège Stanislas. He is best known for his novels, many of which were written in collaboration with the actress and authoress Colette. The most famous of these is *Claudine à l'Ecole* (1900), with its sequels *Claudine à Paris* (1901, dramatized 1902), *Claudine en Ménage* (1902) and *Claudine s'en va* (1903). Included in this series is *La Maison de Claudine*.

WILMERDING, a borough of Allegheny county, Pennsylvania, U.S.A., 14 m. S.S.E. of Pittsburgh, on the Pennsylvania railroad, between the boroughs of Turtle Creek and Pitcairn, in a

valley surrounded by three hills. Pop. (1920) 6,441 (28% foreign-born white); 1928 local estimate 7,500. The borough was incorporated in 1890.

WILMETTE, a beautiful residential village of Cook county, Illinois, U.S.A.; on Lake Michigan, 14 m. N. of Chicago. It is served by the Chicago and North Western and the Chicago, North Shore and Milwaukee railways. Pop. 7,814 in 1920 (88% native white); estimated locally at 16,000 in 1928. The village was founded in 1869 and incorporated in 1872.

WILMINGTON, the chief city of Delaware, U.S.A., a port of entry and the county seat of New Castle county; 26 m. S.W. of Philadelphia, on the Delaware river, at the mouth of the Christiana, which is joined by the Brandywine within the city limits. It is on Federal highways 13 and 40, and is served by the Baltimore and Ohio, the Pennsylvania, and the Reading railways, interurban trolley, motor-bus and truck lines and several steamship companies. Pop. 110,168 in 1920 (16,279 foreign-born white and 10,746 negroes); estimated at 128,500 in 1928, with an additional 40,000 in the immediate suburbs.

Half the population of the State lives in Wilmington; its plants make nearly $\frac{2}{3}$ (by value) of the products manufactured in the State; and its banks hold more than $\frac{2}{3}$ of the deposits in the State's banking institutions. The city occupies 11·26 sq.m. of gently rolling land, the altitude ranging from tidewater to 260 feet. The harbour includes 4 m. of the Christiana river (a tidal stream, 750 ft. wide at its mouth) and the navigable part (about a mile) of the Brandywine, and has a controlling depth in the lower stretches of about 20 ft., which will be increased to 35 ft. by projects now under way. There is a continuous line of piers and wharves along both sides of the Christiana river for two miles. At its mouth is a municipal marine terminal, with ample berthing accommodations and storage space and modern equipment for handling cargoes (constructed by the city in 1920–23).

The public parks cover 703 acres. There are 20 supervised playgrounds, 21 baseball fields and provision for various other sports, 28 public and 21 private and parochial schools, 3 daily newspapers, 115 churches, 4 public hospitals (385 beds) and 10 hotels. Wilmington is the headquarters of both a Roman Catholic and a Protestant Episcopal bishop. The city operates under a mayor-and-council form of government. A zoning ordinance was adopted in 1924. Among the interesting old buildings are Holy Trinity (Old Swedes) church (1698); the building occupied by the Historical Society of Delaware, which was the First Presbyterian meeting house (1740); and the old city hall (1798), now a museum. The Wilmington Institute free library (1788) is housed in a fine new building, completed in 1923. A joint city hall and county building was completed in 1914; and a civic centre (Rodney square) in 1915. The University of Delaware is at Newark, 12 m. south-west.

The traffic of the port amounted in 1925 to 1,020,739 tons (valued at $428,133,674), of which 641,647 tons (valued at $52,658,674) represented commercial shipments and receipts (entirely domestic) and the rest vehicular ferry traffic. There are over 250 diversified manufacturing plants within the city, with an output in 1925 valued at $76,502,097, and products ranging alphabetically from acids to zaponite. Its assessed valuation for 1927 was $129,751,800.

The site of Wilmington was occupied in 1638 by Swedish and Dutch colonists under the leadership of Peter Minuit, and the settlement was called Christinaham in honour of the queen of Sweden. In 1655 the fort (Christina) was captured without bloodshed by Peter Stuyvesant, but very few of the Swedes left the colony. In 1731 a large part of the present territory of the city was owned by Thomas Willing, and was called Willingtown. In 1739 a borough charter was granted by William Penn, and the name with two slight changes was altered to honour the earl of Wilmington. The Battle of Brandywine (Sept. 11, 1777) was fought 10 m. N.W. of Wilmington. In the first half of the 19th century Wilmington was a centre of strong anti-slavery sentiment, and it was a station on the "underground railroad." It was chartered as a city in 1832. Ship-building was established as early as 1739, and in 1836 the first iron steamship built in the United States was constructed here. In 1802 the French refugee Eleuthère Irénée du Pont de Nemours (1771–1834), who had learned from Lavoisier the modern methods of powder-making, established the company which still bears the family name and is carried on by his descendants, and built on the Brandywine the first powder-mill in America.

WILMINGTON, the chief seaport of North Carolina, U.S.A., a port of entry and the county seat of New Hanover county; in the south-eastern part of the State, on the Cape Fear river, 30 m. from the ocean bar at its mouth. It is on Federal highways 17 and 17-1; has a municipal airport; and is served by the Atlantic Coast Line and the Seaboard Air Line railways and steamship lines. Pop. 33,372 in 1920 (40% negroes); estimated locally at over 41,000 in 1928. The city lies on an elevated sand ridge, extending along the river for 2·5 miles. Causeway and trolley connect it with Wrightsville beach (8 m. E.), and 14 m. S. are three other resorts on the mainland (Carolina, Wilmington and Fort Fisher beaches). The ample fresh-water harbour accommodates vessels drawing 27·5 ft., and the channel down the river and over the bar has a depth of 26 ft. at mean low water. The commerce of the port in 1925 amounted to 1,027,653 tons, valued at $62,888,068, of which $24,711,889 represented foreign trade (imports of molasses and chemicals for fertilizer and exports of cotton). Wholesale and jobbing business amounts to $80,000,000 annually. It is the headquarters of the Atlantic Coast Line railroad, which employs about 2,000 persons in its offices and shops here. Wilmington operates under a commission form of government. Its assessed valuation for 1927 was $45,736,070.

A settlement was established here in 1730. It was called New Liverpool at first, New Town after 1732 and in 1739 was incorporated and renamed in honour of Spencer Compton, Earl of Wilmington (*c.* 1673–1743). In 1760 it was incorporated as a borough and in 1866 as a city. It was the first place to make armed resistance to the Stamp Act. Cornwallis made it his headquarters through most of the year 1781. During the Civil War, although blockaded by the Union fleet, it was the centre of a lively foreign trade, and was the last port kept open by the Confederacy. It was defended by Ft. Fisher, a heavy earthwork on the peninsula between the river and the ocean, which was finally taken, after several terrific bombardments, by a combined naval and land attack, on Jan. 15, 1865.

WILMOT, DAVID (1814–1868), American political leader, born at Bethany, Penn., Jan. 20, 1814. He was admitted to the bar in 1834 and practised law in Towanda. He entered politics as a Democrat, served in the National House of Representatives (1845–51), and, although he favoured the Walker Tariff, the Mexican War, and other party measures, he opposed the extension of slavery. On Aug. 8, 1846, on behalf of advocates of the restriction of slavery he offered an amendment to a bill appropriating $2,000,000 to settle the U.S. boundary with Mexico by purchase of land if necessary, to the effect that "neither slavery nor involuntary servitude shall ever exist in any part of the said territory" acquired from Mexico. The bill including the Wilmot Proviso, as the amendment was called, passed the House, but was defeated by the Senate's adjournment. In the next session a similar bill was introduced in the House and again Wilmot moved to attach his proviso. A second time it passed the House, but the Senate refused to consider it and on the last day of the session secured the consent of the House to the unamended bill. Although the Wilmot Proviso failed in 1847, it was revived in the House again and again in the two years following; it was a formulation of the essential issue of the Civil War; out of the efforts of the Democrats and Whigs to subordinate this issue, grew the Republican Party that definitely accepted the principle of the proviso. Wilmot supported Van Buren in 1848 and entered the Republican Party at the time of its formation. He was president judge of the 13th judicial district of Pennsylvania in 1853–61, U.S. senator in 1861–63, and judge of the U.S. court of claims in 1863–68. He died at Towanda, Penn., March 16, 1868.

See G. P. Garrison, *Westward Extension* (1906); Charles B. Going, *David Wilmot, Free-Soiler* (1924).

WILNO: *see* VILNA.

WILSON, ALEXANDER (1766–1813), American ornithologist and poet, was born in Paisley, Scotland, July 6, 1766. At 13 he was apprenticed to a weaver that he might follow his father's trade, but after a few years rebelled and became a pedlar. Tramping up and down Scotland, he composed numerous dialect poems treating his lot or depicting with broad humour and the pathos born of poverty the life of the folk. The most famous of these productions, *Watty and Meg*, published as a penny chapbook, is said to have sold to the number of 100,000 copies within a few weeks and to have been praised by Burns. In the labour troubles which arose at this time Wilson's sympathies were naturally with the oppressed weavers. He published a number of lampoons in verse, for which he was convicted of libel and compelled to burn his satires at the town cross, and later, for lack of money for a fine, he was imprisoned. It is small wonder then that with his nephew, William Duncan, he emigrated to America as a deck passenger, landing with only a gun and the clothes on his back. His years of poverty and hardship were not over, but a turning point came when as a village schoolmaster in Philadelphia he met William Bartram, the naturalist, who encouraged him in his drawing and collecting "of all the birds in this part of North America." In 1806 he obtained the assistant-editorship of the American edition of *Ree's Encyclopaedia*, and thus acquired more means and leisure for his great work, *American Ornithology*, the first volume of which appeared in the autumn of 1808, after which he spent the winter in a journey "in search of birds and subscribers." By the spring of 1813 seven volumes had appeared. He succumbed to dysentery at Philadelphia Aug. 23, 1813.

Wilson's *Poems and Literary Prose* were edited with a memoir by the Rev. A. B. Grosart in 1876, a statue being erected to Wilson in Paisley the same year. The eighth and ninth volumes of the *American Ornithology* were edited after his decease by his friend George Ord, who published an early *Sketch of the Life of Alexander Wilson*, and the work was continued by Lucien Bonaparte. The complete *Ornithology* has been several times republished.

WILSON, SIR ARTHUR KNYVET, 3RD BARON (1842–1921), English admiral, was born at Swaffham, Norfolk, on March 3, 1842. He entered the navy in 1855, and served in the Crimean War and the Chinese campaign of 1857–58. In 1876 he was appointed to H.M.S. "Vernon," the torpedo school-ship at Portsmouth. With the rank of captain (1880), he took part in the operations against Alexandria, and in 1884 won the V.C. at El Teb for great gallantry in single combat with the Arab enemy. He became rear-admiral in 1895, third sea lord and controller of the navy in 1897, and vice-admiral in 1901, receiving the K.C.B. in 1902. From 1901–03 he commanded the Channel squadron, and from 1903–07 was commander-in-chief of the Home and Channel fleets. On leaving that command in 1907 he was specially promoted to the rank of admiral of the fleet. In 1909 he succeeded Lord Fisher as first sea lord. On retirement from that office he received, in 1912, the Order of Merit. During the World War he acted in an advisory capacity to the Board of Admiralty and on the sudden resignation of Lord Fisher in May 1915, he was offered by Winston Churchill, and with much diffidence accepted, the appointment of first sea lord for a second time. But Churchill was himself superseded and the appointment never materialized. He died at Swaffham on May 25, 1921.

See Admiral Sir Edward Bradford, *Admiral of the Fleet Sir A. K. Wilson* (1923). (E. A.)

WILSON, SIR ERASMUS (1809–1884), British surgeon and philanthropist, was born in London on Nov. 25, 1809, studied at St. Bartholomew's Hospital in London, and at Aberdeen, and early in life became known as a skilful operator and dissector. He took up skin diseases as a special study. In the opinion of one of his biographers, we owe to Wilson in great measure the habit of the daily bath, and he helped very much to bring the Turkish bath into use in Great Britain. His books, *A Healthy Skin* and *Student's Book of Diseases of the Skin*, have long remained text-books of their subject. Wilson founded in 1869 the chair and museum of dermatology in the Royal College of Surgeons, of which he was chosen president in 1881. He also founded a professorship of pathology at Aberdeen university. After the death of his wife the bulk of his property, some £200,000, went to the Royal College of Surgeons. In 1878 he defrayed the expense of bringing the Egyptian obelisk called Cleopatra's Needle from Alexandria to London, where it was erected on the Thames Embankment. He was knighted in 1881 and died at Westgate-on-Sea on Aug. 7, 1884.

WILSON, HENRY (1812–1875), vice-president of the United States from 1873 to 1875, was born at Farmington, N.H., on Feb. 16, 1812. At the age of 21, for some unstated reason, he had his name changed by act of the legislature to Henry Wilson. At Natick, Mass., whither he travelled on foot, he learned the trade of shoemaker, and during his leisure hours studied much. After successfully establishing himself as a shoe manufacturer, he attracted attention as a public speaker in support of William Henry Harrison during the campaign of 1840. In 1855 he was elected to the United States Senate and remained there by re-elections until 1873. His uncompromising opposition to the institution of slavery furnished the keynote of his earlier senatorial career, and he soon took rank as one of the ablest and most effective anti-slavery orators in the United States. Upon the outbreak of the Civil War he was made chairman of the military committee of the Senate, and in this position performed most laborious and important work for the four years of the war. The Republicans nominated Wilson for the vice-presidency in 1872, and he was elected. He died on Nov. 22, 1875.

He published, besides many orations, a *History of the Anti-Slavery Measures of the Thirty-Seventh and Thirty-Eighth United States Congresses* (1865); *Military Measures of the United States Congress* (1868); *History of the Reconstruction Measures of the Thirty-Ninth and Fortieth Congresses* (1868) and *History of the Rise and Fall of the Slave Power in America* (1872–75), his most important work.

The best biography is that by Elias Nason and Thomas Russell, *The Life and Public Services of Henry Wilson* (Boston, 1876).

WILSON, SIR HENRY HUGHES (1864–1922), British soldier, was born at Edgeworthstown, County Longford, Ireland, on March 5, 1864, and educated at Marlborough and Sandhurst. He joined the Rifle Brigade in 1884 and in 1894 he married a daughter of G. C. Wray. From the outset he was a serious and an ambitious soldier, and while his natural gaiety of disposition made him a welcome companion everywhere, his industry soon attracted the attention of his superiors. He was indeed, almost from the first, one of those men who could not be overlooked. His earliest experience of active service was in Burma betwen 1886 and 1888, and when the Boer War broke out in 1899 he had passed through the Staff College and become a brigade major at Aldershot.

Before that war ended Wilson was brought back to the war office, where in the newly formed staff-duties directorate it was his especial task to study and to apply the lessons which were learned in South Africa—of which the chief perhaps was the necessity of organising the British Army on something approaching continental lines and establishing a general staff for the study and application of the principles of war. In the work of reform Henry Wilson played a great, if still subordinate, part and it was no surprise when, in 1906, he was appointed to succeed Rawlinson as commandant of the Staff College at Camberley. Himself an inspiring teacher with the Irishman's birthright of eloquence, he gathered around him a group of young officers upon whom he impressed his own views and his own system. More than all he became himself impressed with an almost overpowering sense of the imminence of war between France and Germany. The Entente was already in existence, and if it were to mean anything at all, must carry with it grave military responsibilities. Wilson, therefore, established close relations with the French Staff College, and particularly a close personal friendship with its commandant, Ferdinand Foch, whose great work *Les Principes de la Guerre (The Principles of War)* became a text-book in Great Britain. Under his influence Wilson became more and more convinced of the danger which was threatening Europe and made himself acquainted with the Franco-German frontier.

In 1910 he left the Staff College to succeed Sir W. Robertson as director of military operations, while Robertson took Wilson's place at Camberley. In Whitehall, Wilson concentrated

the labours of his directorate upon what he believed to be the vital field of operations. Incidentally he was one of Lord Roberts' most ardent supporters in his campaign for national training. Thus, while British statesmen were striving for peace, the director of military operations, acting under the chief of the Imperial General Staff, was step by step perfecting the nation's preparations for war. At each step he had the cordial support of the other directors, with the result that in August 1914 the British war office was in a position to bring off the greatest strategical surprise of the whole war. Mobilisation was rapid and the Expeditionary Force was landed in France without the loss of a man or a horse, complete in every detail.

In France Wilson was deputy chief of the general staff. Of all those who crossed with the British Expeditionary Force he was without doubt the best known in France, so much so that when the number of British troops increased the British Army Corps came to be referred to in French confidential documents as *C. d'A.W.* or *Corps d'Armée Wilson.* It was therefore natural that he should be appointed principal liaison officer with the French field headquarters, a post which he held until he took command of the IV. Army Corps towards the end of 1915.

Although deeply interested in the life and welfare of the private soldier, he never really made his mark as a commander. To some extent, no doubt, this was due to lack of opportunity, but still more to temperament and to mental development along other lines. Thus it was that early in 1917 he left the field armies for good and accompanied Lord Milner's mission to Russia. In Nov. 1917 he went to Versailles as British military representative on the newly-established Supreme War Council. Three months later, less than a month before the great German attack of March 1918, he once more succeeded Robertson and this time as chief of the Imperial General Staff in London. He was one of those who supported Lloyd George in his efforts to secure unity of command on the Western front and strongly pressed the claims of his old friend Foch to be appointed commander-in-chief of the Allied forces in France and Flanders.

Wilson had always belonged to what became known as the Eastern school of thought rather than to the Western, and when the German advance had been checked he worked hard to re-establish that Eastern front which had been shaken by the Russian revolution and shattered by "General Hofmann's jack-boot," at Brest Litovsk. When the Armistice was declared on Nov. 11, 1918, he had attained the rank of general, and in the final honours for the War he was promoted field marshal, was given a baronetcy and a grant of £10,000. As chief of the General Staff he was military adviser of the government during the prolonged negotiations at Versailles, and subsequently at numerous conferences. His mastery of language and effective manner of expressing in non-technical terms his views on technical matters no less than his charm of manner made him *persona grata* to ministers of state, and his intimacy with all the French superior commanders enabled him to make smooth on times of stress many rough places.

Parliamentary Career.—Unfortunately, when the War was over, the troubles in Ireland came to a head and Wilson was a great Irishman. His position as chief of the Imperial General Staff, under a government with whose policy in Ireland he could not agree, became extremely difficult. Cordial relations became strained and old friendships were broken. When, in Feb. 1922, his tenure at the war office came to an end he entered parliament as member for North Down and at the same time he placed his military experience at the disposal of the Government of Northern Ireland. Seldom has a new member gone to Westminster better equipped. Debate, and especially criticism, came easily to him, for he was a ready and effective speaker with sufficient restraint to prevent him from discussing subjects of which he did not possess special knowledge. His maiden speech was delivered on March 15 on the Army estimates and was followed at fairly frequent intervals by others on the Irish question. Here he quickly established himself as the most outspoken critic of those colleagues with whom in his military capacity he had worked so long, and in so doing he drew upon himself the hatred of his fellow countrymen in the 26 counties. On May 31, 1922, when the situation was critical, he concluded a speech with the words:

> I wonder when the moment will come when the Government will have the honesty and truthfulness to say, "We have miscalculated every single element in the Irish problem. We are exceedingly sorry for all the terrible things that have happened owing to our actions. We beg leave to return to private life and never to appear again."

He never spoke again in the House of Commons, for just three weeks later he was shot on his own doorstep in Eaton Place, London, as he returned from Liverpool Street Station after unveiling a memorial to the men of the Great Eastern Railway who had fallen in the War. He was buried with full military honours in St. Paul's Cathedral.

Sir Henry Wilson's character is difficult to sum up. Essentially a critic, he nevertheless did great constructive work for the British Army and was, as much as any man in Great Britain, the builder, though not the architect, of the Entente with France. Nevertheless he cannot be ranked with the greatest soldiers for he never held high command; in parliament he achieved distinction, but died before he could prove himself a statesman. (N. MA.)

His *Life and Letters* were published by Major-General Sir C. E. Callwell, with a preface by Marshal Foch (2 vols., 1927).

WILSON, JAMES (1742–1798), American statesman and jurist, born in or near St. Andrews, Scotland, September 14, 1742. He matriculated at the University of St. Andrews in 1757 and was subsequently a student at the universities of Glasgow and Edinburgh. In 1765 he emigrated to America. Landing at New York in June, he went to Philadelphia in the following year and in 1766–1767 was instructor of Latin in the college of Philadelphia, later the University of Pennsylvania. Meanwhile he studied law in the office of John Dickinson, was admitted to the bar in 1767, removed first to Reading and soon afterward to Carlisle, and rapidly rose to prominence. In August 1774 he published a pamphlet *Considerations on the Nature and Extent of the Legislative Authority of the British Parliament,* in which he argued that parliament had no constitutional power to legislate for the colonies; this pamphlet strongly influenced members of the Continental Congress which met in September. Wilson was a delegate to the Pennsylvania provincial convention in January 1775, and he sustained there the right of Massachusetts to resist the change in its charter, declaring that as the force which the British Government was exercising to compel obedience was "force unwarranted by any act of parliament, unsupported by any principle of the common law, unauthorized by any commission from the crown," resistance was justified by "both the letter and the spirit of the British constitution"; he also, by his speech, led the colonies in shifting the burden of responsibility from parliament or the king's ministers to the king himself. In May 1775 Wilson became a member of the Continental Congress. He was in favour of the Declaration of Independence and a signer of that document. Receiving a commission as colonel in May 1775, Wilson raised a battalion of troops in his county of Cumberland, and for a short time in 1776 he took part in the New Jersey campaign, but his principal labours in 1776 and 1777 were in Congress. In May 1777 he wrote the address *To the Inhabitants of the United States,* urging their firm support of the cause of Independence; he drafted the plan of treaty with France together with instructions for negotiating it; he was a member of the Board of War from its establishment in June 1776 until his retirement from Congress in September 1777; from January to September 1777 he was chairman of the Committee on Appeals to hear and determine appeals from the courts of admiralty in the several states; and he was a member of many other important committees. In September 1777 the political faction in his state which opposed Independence came into power, and Wilson was kept out of Congress until the close of the war; he was back again, however, in 1783, and 1785–1786, and, advocating a sound currency, laboured in co-operation with Robert Morris to direct the financial policy of the Confederation.

In 1779 he was commissioned advocate-general for France, and in this capacity he represented Louis XVI. in all claims arising out of the French alliance until the close of the war. In 1781–1782 he

was the principal counsel for Pennsylvania in the dispute with Connecticut over possession of the Wyoming valley, which was decided in favour of Pennsylvania in December 1782 by an arbitration court appointed by Congress.

As a constructive statesman Wilson had no superior in the Federal Convention of 1787. He favoured the independence of the executive, legislative and judicial departments, the supremacy of the Federal Government over the State Governments, and the election of senators as well as representatives by the people, and was opposed to the election of the President or the judges by Congress. His political philosophy was based upon implicit confidence in the people, and he strove for such provisions as he thought would best guarantee a government by the people. Together with Gouverneur Morris he wrote the final draft of the Constitution and afterwards pronounced it "the best form of government which has ever been offered to the world." In the Pennsylvania ratification convention (November 21 to December 15, 1787) he was the constitution's principal defender.

Wilson was a delegate to the Pennsylvania state constitutional convention of 1789–1790, and a member of the committee which drafted the new constitution. In 1789 Washington appointed him an associate justice of the United States Supreme Court, and in 1793 he wrote the important decision in the case of *Chisholm* v. *Georgia*, the purport of which was that the people of the United States constituted a sovereign nation and that the United States were not a mere confederacy of sovereign states. He continued to serve as associate justice until his death, near Edenton, North Carolina, on August 28, 1798.

Wilson's *Works*, consisting principally of his law lectures and a few speeches, were published under the direction of his son, Bird Wilson (3 vols., 1803–1804; rev. ed., with notes, 1896). *See* also *Documentary History of the Constitution of the United States of America*, vols. i. and iii. (Washington, 1894); J. B. McMaster and F. D. Stone, *Pennsylvania and the Federal Constitution, 1787–1788* (1888); L. H. Alexander (ed.), *James Wilson* (1908); A. C. McLaughlin, "James Wilson and the Constitution," *Political Science Quarterly*, vol. 12 (1897); Justice J. M. Harlan, "James Wilson and the Formation of the Constitution," in the *American Law Review*, vol. 34; B. A. Konkle *et al.*, "The James Wilson Memorial," in the *American Law Register*, vol. 55 (1907); R. C. Adams, "The Legal Theories of James Wilson," *Univ. of Pa. Law Review*, vol. 68 (1920).

WILSON, JOHN (1595–1674), English composer. He was engaged to write the music for a "Maske of Flowers," written for the wedding of the earl of Somerset and the daughter of the earl of Suffolk in 1614. Although the printed copy does not contain Wilson's name, he afterwards printed the songs in an arrangement for three voices in his "Cheerfull Ayres" (1660). Other songs from plays, including some from Shakespeare were printed by him in later collections, and there is reason to suppose that he sang on the stage and is identical with a Jacke Wilson, mentioned in the stage direction of the first folio edition of Shakespeare (1623). Wilson became one of the King's Musicians in 1635 and was evidently a remarkable lutenist, much appreciated by Charles I. on that account and also for his singing. In the Civil War he went with the court to Oxford, and in 1645 was made Mus.D. of the university, as being "now the most noted Musitian of England." After the surrender of Oxford he retired into the country for some years, most of his compositions being published during this period. In 1656 he was appointed professor of music at Oxford, with rooms in Balliol college. His professorship came to an end in 1661. In 1657 he had published what purported to be his last work, the "Psalterium Carolinum" for three voices and organ or theorbo. The "Cheerfull Ayres" which followed contained earlier songs revised. He went back to his post as one of the King's Musicians at the Restoration and in 1662 became a gentleman of the Chapel Royal in place of Henry Lawes. He died at the Horseferry, Westminster, on Feb. 22, 1674. A portrait of him is in the Oxford Music School. His early settings of Shakespeare's songs, including "Take, O take those lips away," and other of his songs show him to have been a master of melody. His manuscript music is in the British Museum, the Bodleian, and elsewhere; songs and catches occur in Playford's "Select Musicall Ayres and Dialogues" (1652, 1653), in his "Catch that catch can" (1667) and other collections.

See the article by G. E. P. Arkwright in Grove's *Dictionary*.

WILSON, JOHN (1785–1854), Scottish writer, the CHRISTOPHER NORTH of *Blackwood's Magazine*, was born at Paisley on May 18, 1785, the son of a wealthy gauze manufacturer who died when John was eleven years old. In 1803 Wilson was entered as a gentleman commoner at Magdalen College, Oxford. He took his degree in 1807, and found himself at twenty-two his own master, with a good income, no father or guardian to control him, and an estate on Windermere called Elleray. In 1812 he published a considerable volume of poems the *Isle of Palms*. In 1815 he lost his fortune. He now read law and was called to the Scottish bar. In 1817 Wilson began his connection with *Blackwood's Magazine*. He became the principal writer for the review, though he was never its nominal editor. In 1822 began the series of *Noctes Ambrosianae*, after 1825 mostly Wilson's work.

Wilson now established himself (1819) in Ann Street, Edinburgh, with his wife and family of five children, and in 1820 he was elected to the chair of moral philosophy in the university of Edinburgh. His duties left him plenty of time for magazine work, and for many years his contributions to *Blackwood* were extraordinarily voluminous, in one year (1834) amounting to over fifty separate articles. In 1851 he resigned his professorship, and a Civil List pension of £300 a year was conferred on him. He died at Edinburgh on April 3, 1854.

See Christopher North, by Mrs. Mary Gordon, his daughter (1862); and Mrs. Oliphant, *Annals of a Publishing House; William Blackwood and his Sons* (1897).

WILSON, RICHARD (1714–1782), English landscape painter, was born at Penegoes, Montgomeryshire, where his father was a clergyman, on Aug. 1, 1714. In 1729 he was sent to London to study under Thomas Wright, a little-known portrait painter of the time. After six years he started on his own account, and was soon in a good practice. In 1749 Wilson visited Italy, where he spent six years. "Niobe," one of his best works, was exhibited at the Society of Artists in 1760. He was an original member of the Royal Academy and was a regular contributor to its exhibitions till 1780. During his lifetime his landscapes were never widely popular; his temper was consequently embittered by neglect, and he was so poor that he had to live in an obscure, half-furnished room in Tottenham Court Road, London. In 1776, however, he obtained the post of librarian to the Academy; and by the death of a brother he acquired a small property near Llanferras, Denbighshire, to which he retired to spend his last days, and where he died suddenly in May 1782. After his death his fame increased, and in 1814 about seventy of his works were exhibited in the British Institution. The National Gallery, London, contains nine of his landscapes.

See *Studies and Designs by Richard Wilson, done at Rome in the year 1752* (Oxford, 1811); T. Wright, *Some Account of the Life of Richard Wilson* (1824); Thomas Hastings, *Etchings from the Works of Richard Wilson, with some Memoirs of his Life* (London, 1825). Many of Wilson's best works were reproduced by Woollett and other engravers of the time. His portraits will be found in Greenwich hospital, the Garrick Club and private collections.

WILSON, ROBERT (d. 1600), English actor and playwright, was a comedian in the earl of Leicester's company in 1572, 1574 and 1581; and from 1583 until about 1588 in the Queen's. He then probably gave up acting for writing. He wrote several morality plays. The *Three Ladies of London* (1584), *Three Lords of London* (1590) and *The Cobbler's Prophecy* (1594) are generally ascribed to him. *Three Ladies of London* (1584) contains the episode of the attempt of the Jew to recover his debt, afterwards adapted by Shakespeare in *The Merchant of Venice*. Robert Wilson (1579–1610), supposed to be his son, was one of Henslowe's dramatic hack-writers.

WILSON, THOMAS WOODROW (1856–1924), 28th President of the United States, was born in Staunton, Va., Dec. 28, 1856. The Scotch strain predominated in his ancestry, for his paternal grandfather came from County Down, in Ulster, and his maternal grandfather, Thomas Woodrow, a graduate of Glasgow,

from Scotland. The stern Presbyterianism of his father, a minister of small means but marked capacity as a theologian, early influenced him and left an indelible mark upon his character. His early years were spent in Georgia and South Carolina, where he was deeply affected by the sufferings of the South during the reconstruction period. In 1875 he entered Princeton, graduating four years later. His record for scholarship in college was not remarkable, but he was prominent in debating and literary circles, and became student director of athletic sport. His most notable achievement was an article written in his senior year, and published in the *International Review*, which analysed unfavourably the procedure of Congress and formed the basis of his more mature political principles. After studying law in the university of Virginia and following a brief attempt to practise in Atlanta, he decided to pursue his studies in government and history at Johns Hopkins University, where he received the degree of Ph.D. in 1886.

Wilson's thesis, entitled *Congressional Government* (1885), was a development of the attack upon Congressional methods, and because of its clear and felicitous expression has been reprinted many times. In that year[1] he began his teaching career at Bryn Mawr college, where he was associate professor of history and political economy until 1888; after two years as professor of the same at Wesleyan, he entered the Princeton faculty in 1890 as professor of jurisprudence and political economy. With slight changes in title he served in this capacity until 1902, when he became president of Princeton. As professor he rapidly achieved distinction. His lectures were remarkable for clarity of presentation and brilliancy of phrasing, and the same qualities characterised both his addresses and his published writings. His gift was for generalisation rather than plodding scholarship, and after the publication of his thesis his happiest literary efforts were in essay form. They display keen critical capacity, but are not remarkable either for erudition or for striking creative power. As president of Princeton, Wilson devoted himself to serious reforms of the educational and social habits of the undergraduates. In the hope of elevating the standards of scholarship and of increasing the efficiency of instruction, he inaugurated in 1905 the "preceptorial system," designed through small classes to bring teachers and students into the most intimate relationship. In his endeavours to democratise the social life of the university he met determined opposition. Further difficulties developed from a disagreement with the dean of the graduate college. Wilson's policies aroused warm controversy among alumni, faculty and undergraduates.

While at Princeton, both as professor and as president, Wilson displayed great interest in political questions of the day, and through his addresses and articles speedily won a national reputation. In Sept. 1910 he was tendered the Democratic nomination for governor of New Jersey. The offer, coming at the moment when the prospects for success of his policy at Princeton seemed most discouraging, secured his ready acceptance. Resigning his academic position he entered upon an active electoral campaign which won him the support of progressive elements throughout the state, despite the fact that his candidacy had been inaugurated largely under the auspices of the conservative Col. George Harvey (afterwards U.S. ambassador to Great Britain) and the Democratic state boss, Senator James Smith.

In Nov. he was elected by a plurality of 49,000 votes. He at once made it plain that he intended, regardless of the protests of machine leaders, to fulfil his liberal pledges and would assume the leadership of the party for this purpose. As governor he successfully carried through a series of reform measures. Of these the most significant were: a Direct Primaries Law, which, supplemented by an effective Corrupt Practices Act, did much to purify the political atmosphere of New Jersey; an Employers' Liability Act; the creation of a Public Utilities Commission; reform in municipal administration, making possible the adoption of the commission form of government. Elections to the state Senate and Assembly in 1911 gave the Republicans a majority in both Houses and the legislative output was curtailed. Nevertheless his final activities as governor were characterised by the impetus which he gave to the passage of a series of bills, known as the Seven Sisters, directed to the protection of the public from exploitation by trusts.

When in June 1912 the Democratic National Convention met at Baltimore to choose a candidate for President, Wilson's reputation as an effective reformer had brought his name prominently before the delegates. The convention was apparently controlled by conservative elements and there seemed little chance of the nomination of an anti-machine progressive. But as the struggle to secure the necessary two-thirds vote proceeded, with the conservative forces divided between Champ Clark, Harmon and Underwood, W. J. Bryan, leader of the progressive elements, threw his dominating influence in favour of Wilson. It proved decisive, and on the 46th ballot he was nominated, July 2, 1912. In the campaign that followed he voiced popular discontent with the conservatism of the Republican administration, which he believed to have been too closely allied with the interests of "privileged big business." His campaign speeches, characterised by a striking phraseology, won much applause, but were remarkable for their high moral tone rather than for originality of thought or policy. Like Roosevelt he demanded a national renaissance of ideals. In matters of immediate concern, such as the tariff, trust regulation, currency, the interests of labour, he insisted that the "rule of justice and right" must be set up. As regarded the future, in matters of conservation and trade, he asserted that great opportunities had been lost through the interlacing of privilege and private advantage with the framework of existing laws: "we must effect a great readjustment and get the forces of the whole people once more into play." His radicalism was of a mild sort, and he insisted that "we need no revolution, we need no excited change; we need only a new point of view and a new method and spirit of counsel." The popular temper was responsive to such a tone, but success in large measure could hardly have come to him except for the division of Republican forces through the campaign of Theodore Roosevelt as Progressive candidate. In the Nov. election Wilson received 435 electoral votes as against 88 for Roosevelt and 8 for Taft; but his popular vote was 1,000,000 less than that of his two chief opponents, and in only 14 states (all in the South) did he receive a clear majority.

Despite the fact that he was the choice of a minority of the whole people, Wilson's political position when he assumed office on March 4, 1913 was one of remarkable strength. He was supported by a Democratic majority in both Houses of Congress, the Republicans were at loggerheads and he might expect support from the Progressives for much of his reforming legislative programme. His cabinet was not distinguished, but it contained certain elements of political and administrative strength, which proved advantageous for the moment, although later it was to become the mark for bitter criticism. The President soon made it plain that he was determined, as in his governorship of New Jersey, to exercise his personal influence and his position as head of the party to initiate and carry through the legislation he had advocated in his campaign. His ascendancy in Congress was soon established. After convoking both Houses in special session on April 7, 1913 he delivered his first message in person, reviving the custom that had lapsed since the administration (1797) of the elder Adams. He intervened constantly during this and later sessions, to further the legislation in which he was especially interested.

The first important piece of legislation that resulted from the special session was the Underwood Tariff Act, which was passed in Sept. and signed by the President Oct. 3, 1913. It provided for a notable downward revision, and naturally met strong opposition from varied industrial interests. Such opposition was overcome largely through the personal efforts of Wilson, who appealed constantly to public sentiment, notably in an attack upon the activities of hostile lobbyists. The Tariff Act, in addition to lower duties and important administrative changes, intro-

[1] In 1885 he married Ellen Louise Axson, of Savannah, Ga., who died in 1914, leaving three daughters. On Dec. 18, 1915, he married Edith Bolling Galt, of Washington, D.C.

duced an income tax—long advocated by Democrats—which was destined in later developments to counterbalance the loss of revenue resulting from the lowering of the tariff; it weighed heavily upon the industrial interests of the North and increased the growing unpopularity of the President in that region. The Tariff Act was followed by a broad measure of currency reform, the Federal Reserve Act, signed Dec. 23, 1913; it is generally regarded as the administration's second great legislative triumph. Wilson's purpose was to supplant the dictatorship of private banking institutions by a reorganisation that should provide funds available to meet extraordinary demands and a currency that would expand and contract automatically. Early in 1914 the President called upon Congress to continue its labours of reform by the regulation of the trusts. After long debate and warm opposition, his appeal was answered by the passing of the Federal Trade Commission Act and the Clayton Anti-trust Act. The latter, besides perfecting anti-trust legislation in several ways, met the demands of labour by declaring that labour was not a commodity, by prohibiting injunctions in labour disputes unless necessary to prevent irreparable injury, and by proclaiming that strikes and boycotts were not violations of Federal law. It further exempted labour associations from the anti-trust laws.

Wilson's policy of domestic social reform had thus been developed with surprising legislative success during the first year of his administration. His foreign policy was not so clear-cut and aroused little enthusiasm. It was characterised by an evident desire to concede the rights of other nations to the limit and to avoid any stressing of the power of the United States for the material advantage of its citizens. Definite steps were taken to prepare the Filipinos for self-government. Pressure was brought to bear upon the California State Government to mitigate the severity of its anti-Japanese legislation. The "dollar diplomacy" of the preceding administration was repudiated and American bankers effectively discouraged from participating in the international Chinese loans. As a result of the President's personal demand, Congress repealed the law exempting American coastwise shipping from Panama Canal tolls. Wilson, however, failed to secure the Senate's ratification of a treaty with Colombia, which contained a virtual apology on the part of the United States and an offer to pay $25,000,000 as reparation for the alleged grievances of Colombia in connection with the establishment of Panama as an independent country. In the Caribbean, Wilson's policy differed in principle rather than practice from that of his predecessors; in Nicaragua and Haiti the customs were taken over by U.S. officials. By a treaty signed Sept. 16, 1915, a virtual protectorate of Haiti was assumed; in Santo Domingo the precautionary visits of American cruisers were followed in the summer of 1916 by the landing of marines, and in Nov. of that year by the proclamation of a military government under American auspices.

Wilson's Mexican policy aroused heated criticism. Following the accession of Gen. Victoriano Huerta to power and the President's failure to arrange a settlement providing for his elimination as dictator, Wilson resigned himself to what he called a policy of "watchful waiting." Conditions in Mexico were anarchical, and intervention was strongly urged by both American and European commercial interests. To formal intervention the President was definitely opposed, but in April 1914 he was compelled to authorise the occupation of Vera Cruz in retaliation for affronts to American bluejackets. The proffered mediation of Argentina, Brazil and Chile he gladly accepted, but the resulting protocol of Niagara Falls (June 24, 1914) did not provide a basis for peace. Although Huerta fled from Mexico in July, the country continued to be torn by rival factions. American troops were withdrawn from Vera Cruz in Nov. 1914, but it was not until Oct. 1915 that the Government of Carranza was recognised by Wilson, in company with eight South and Central American Governments. Further complications ensued. The raid into American territory of Gen. Villa, March 9, 1916, led Wilson to authorise a punitive expedition, which soon aroused the protests of Carranza. In May and June the President mobilised the National Guard and sent a force of about 100,000 to patrol the Mexican border. The crisis was tided over by a joint Mexican-American commission sitting at New London, Conn., which brought no definite settlement, but at least postponed hasty action on either side. In Jan. 1917 the last American troops were withdrawn from Mexican soil. The President's policy had not led to stable conditions in Mexico, and the sole advantage secured seemed to be the emphasis laid by the U.S. Government on the principle that it would not take advantage of the misfortunes of a weak neighbour for its own selfish profit.

Foreign affairs after July 1914 were naturally dominated by the World War. President Wilson insisted upon a policy of strict neutrality. This he emphasised not merely by formal proclamation on Aug. 4, but by an address to the American people on Aug. 18, in which he adjured them, in view of the mixture of nationalities in the United States, to be impartial in thought as well as action. His offer of mediation, made on Aug. 5, remained without response, and further attempts at mediation in early autumn proved fruitless. His determination to remain absolutely aloof from European quarrels was underlined in several addresses, in which he insisted that the United States was in no way concerned, and was further emphasised by his opposition to any change in its military policy. America's vital interest in the struggle, however, soon became plain and resulted in diplomatic controversies, with the belligerents. Great Britain's attempt to control indirect importation of goods into Germany, by an enlargement of contraband schedules and an extension of the doctrine of "continuous voyage" to conditional contraband, was vigorously opposed by President Wilson, who authorised William Jennings Bryan, his Secretary of State, to protest in strong terms. A lengthy interchange of notes followed, which led to no settlement.

The diplomatic controversy with Germany proved more serious. The proclamation of a "war zone" about the British Isles, in which German submarines threatened to destroy enemy merchant vessels with consequent danger to the lives and property of neutrals, was met by a note of Feb. 10, 1915, which warned Germany that she would be held to "strict accountability" for the lawless acts of submarine commanders. Wilson further attempted to find a compromise, based upon a relaxation of the British food blockade and an abandonment of the German submarine campaign. The effort failed and was followed by a series of submarine attacks, which culminated in the sinking of the "Lusitania," May 7, 1915, with the loss of over 100 American lives. The President, while he disappointed opinion in the Eastern States by a speech in which he reaffirmed his pacific determination, stating that a man might be "too proud to fight," at once set out to win from Germany a disavowal and a promise that merchant ships should not be torpedoed without warning and the saving of the lives of passengers.

A lengthy exchange of notes ensued: the pacific Bryan, Secretary of State, regarding the President's language as too strong, resigned; on the other hand Wilson's patience with the evasions of the German Government and the continued sinking by submarines led to bitter attacks upon the President's policy of conciliation, which was stigmatised as anaemic or even cowardly. Wilson succeeded, however, in securing from Germany a promise not to sink liners without warning (Sept. 1, 1915), and continued his efforts to induce Germany to abandon the submarine campaign completely. He was hampered by an attempted revolt of Congressional leaders, who blurred the issue with Germany by introducing resolutions designed to prevent Americans from travelling upon belligerent ships. The President, through his personal influence, secured the defeat of these resolutions in Feb. 1916, insisting that he would not consent "to any abridgment of the rights of American citizens in any respect." Shortly afterwards the issue with Germany was brought to a head by the sinking of the "Sussex," March 24, 1916. Wilson waited three weeks before sending a formal note of protest to Germany (April 19, 1916), but couched it in the form of an ultimatum, stating that unless Germany should immediately declare and effect an abandonment of its present methods of submarine warfare, the United States would be compelled to sever diplomatic relations.

The German answer, while attempting to make acceptance conditional upon Great Britain's relaxation of the blockade, was in effect a promise not to sink merchant ships without warning and without saving human lives. The submarine issue now seemed less critical.

The diplomatic victory thus apparently secured by Wilson was utilised in his behalf during the electoral campaign of 1916, in which he was inevitably the Democratic candidate. It enabled his supporters to declare that he had vindicated the rights of the United States successfully, and at the same time had "kept us out of war." The slogan made a strong appeal, especially in the districts of the Middle West. The Republicans, on the other hand, who had nominated Charles E. Hughes, criticised the whole foreign policy of the President. They insisted that he had failed to take prompt action for the protection of American lives and honour, alike in his dealings with Germany and in his handling of the Mexican crisis. They characterised his domestic policy as demagogic, instancing the Clayton Act and the Adamson Act; the latter had been urged on Congress by Wilson to avert a railroad strike in Sept. 1916, and many citizens regarded it as an untimely surrender to labour threats. They also criticised his attitude on "preparedness," to which the President had been opposed until the close of 1915, and ridiculed the cautious expansion of military forces provided for in the National Defence Act of 1916. In the East and in most industrial centres of the Middle West Wilson was unpopular, but the election showed his strength in the farming districts west of the Mississippi and on the Pacific coast; in spite of Roosevelt's return to the Republican fold the President drew largely from the Progressives, and on election day received a slight electoral majority over Hughes (277 to 254) and a popular plurality of 9,129,606 to 8,538,221.

His re-election enabled Wilson to proceed with plans for peace proposals to the European belligerents. These he had been preparing since the early spring of 1916. He had authorized Col. House to propose to the British that the President "on hearing from France and Britain that the moment was opportune" should propose a conference to end the war. "Should the Allies accept this proposal and should Germany refuse it, the United States would probably enter the war against Germany." The Allies made no move to take advantage of American help in this plan to enforce peace. Wilson decided to act independently and on Dec. 18 sent identical notes to the belligerents, asking them to state the terms upon which they would consider peace. Informed of the undercurrents of German military circles, he evidently feared that if the war continued the United States would necessarily become involved; he also hoped that a clear definition of war aims would strengthen pacific elements in both belligerent camps. The German reply was evasive; that of the Allies refused to consider peace until Germany should offer "complete restitution, full reparation and effectual guarantees." The replies gave the President opportunity to expound what he had come to believe was the only sure basis of an enduring peace. This he did in a speech of Jan. 22, 1917, in which he insisted that the peace must be organised by the major force of mankind, thus emphasising the need of a League of Nations; that no nation should extend its policy over another nation; that no one Power should dominate the land or the sea. There must be a limitation of armaments. As a guarantee of future peace and justice, the ending of the existing war must not be the violation of the rights of one side or the other: it must be "a peace without victory."

Further efforts to secure a peaceful arrangement were frustrated by the determination of the German militarist clique to renew the submarine warfare, regardless of the effect on the United States. On Jan. 31, the German ambassador, Von Bernstorff, who strongly but vainly opposed the intensive submarine campaign, delivered a note to this effect, and four days later the President handed him his papers. He still, however, avoided formal war with Germany, and on Feb. 26 asked for a resolution of armed neutrality, which would permit the arming of American merchant ships for entrance into the barred sea zone. The resolution was blocked by a filibuster. Finally, in view of continued sinking of American ships, the President came to Congress on April 2, 1917 and asked for a declaration that a state of warfare existed with Germany. The resolution was passed by the Senate on April 4, by the House on April 6.

President Wilson had always abhorred the exercise of force in international relations, and the war which he at last regarded as necessary was, in his mind, a war to ensure peace. Nevertheless he was determined that it should be waged efficiently and that the mistakes of previous wars should not be repeated. Those mistakes, he believed, had resulted chiefly from the inter-mixture of politics in military affairs, and from the decentralisation of the American military machine. He opposed a coalition war cabinet, as leading to divided responsibility. Military policy was handed over to the military experts. He approved the immediate development of the general staff as the centralising military organ, and it was upon the recommendation of that body that he urged, against the wish of Congressional leaders, the Selective Service Act. On the advice of the general staff he appointed Gen. John J. Pershing commander of the expeditionary force to France, and, also following that advice, he refused to authorise a volunteer force under Roosevelt. Similarly the plans for the development of a large army in France were inaugurated and translated into fact by the military experts.

As regards conduct of operations the President gave to Gen. Pershing complete authority, and permitted no interference by politicians. In the building of the new army the President took no direct part, but he used his authority consistently to favour centralisation under the general staff. He followed a similar policy in the mobilisation of the industrial resources of the nation. He encouraged the centralising efforts of the Council of National Defence and its committees, and sought always to secure for them executive rather than the merely advisory powers which they at first possessed. He urged the Lever Act, which in Aug. 1917 created a Food and a Fuel Administration, and advocated the taking over of the railroads by the Government in December. His policy of economic centralisation was ultimately assisted by the many protests against his war policies which were made in the winter, and which centred round the demand for a non-partisan war cabinet or ministry of munitions; for his supporters were able to insist that the more effective handling of war problems demanded not new machinery but greater efficiency of the existing mechanism. The President asked for powers to cut through red tape and rearrange bureaux without reference to Congress. His demands were embodied in the Overman Act, which was passed in May 1918, and which enabled him to grant executive powers to the various boards that had been created. The War Industries Board, released from its dependence upon the Council of National Defence, at once became the centralising organ of the economic activities of the country. In his war appointments Wilson disregarded party lines, a notable fact since in political appointments he always showed himself strictly a party man. Republicans, such as Hoover, Stettinius, Goethals, Schwab, Vanderlip, were chosen because of their administrative qualities and regardless of political affiliations.

During the War President Wilson consistently developed his ideals of a new international system which should perpetuate peace and assure justice and security to every nation regardless of its material strength. He hoped thus not merely to construct a basis for just peace when the war should end, but to hasten the end of the war by appealing to the peoples of the enemy states against their Governments. The most notable of his speeches was that of Jan. 8, 1918, in which he stated 14 points necessary to a just and lasting peace. This, with his later addresses, was ultimately accepted as the basis of the final settlement. Their effect in Germany and Austria-Hungary was not apparent until the military defeat of those empires, but his words acted continually as a corroding factor, weakening the enemy's determination to fight. When in the autumn of 1918 they faced military defeat, they turned to Wilson, offering to accept his Fourteen Points as the basis of peace.

The President's insistence upon justice as essential to a settlement brought him great prestige in Allied countries, but the chiefs of the Allied Governments hesitated to accept the Fourteen

Points in the fear that the advantages of the victory might be thrown away. They yielded, however, to the persuasive diplomacy of Col. House, who represented the President on the Supreme War Council during the Armistice proceedings, and it was on the understanding that the Fourteen Points (reservations made of "Freedom of the Seas" and inclusion of Germany's promise to make full reparation) should be the basis of the peace that the Armistice was granted to Germany.[1] The President realised, however, that it would be difficult to translate his principles into the actual treaty. Aside from the opposition he might expect from selfish nationalistic interests among the Allies, he lacked unified support at home, where his political opponents called for a "strong peace" that would annihilate Germany; there was little enthusiasm for a League of Nations, which the President regarded as essential to a just and lasting settlement. Furthermore he had weakened his political position at home by a series of tactical mistakes. Of these, the most important was an appeal issued immediately before the Congressional election of Nov. 1918, in which Wilson asked the voters to cast their ballots for Democratic candidates, on the ground that a Republican Congress would divide the leadership at the moment of international crisis. Such an appeal would have been comprehensible if it had been made by a prime minister in a parliamentary country, but Wilson had proclaimed himself the leader of the nation and could not logically also play the rôle of party leader. The Republicans seemed to have some ground for complaining that although they had submerged partisan quarrels during the war, President Wilson was now attempting to capitalise the war and foreign affairs in order to win a partisan advantage. Many voters were antagonised by the appeal, and the elections went in favour of the Republicans. The President, in consequence of the substantial reverses sustained in the November elections, lost command of the Senate in the next Congress and its Foreign Relations Committee was to be controlled by his political and personal opponents.

Believing that his presence at the Peace Conference was necessary, if it was not to be dominated by old-style diplomatic practices, Wilson decided himself to go to Paris, and on Dec. 4, 1918 sailed with the other members of the American Commission on the "George Washington." He arrived at Brest on Dec. 13, and was received at Paris, in England and at Rome with tremendous enthusiasm. For the moment he was the popular hero, both in Allied and enemy countries. But his prestige rested on a precarious footing, and must inevitably diminish when he came to oppose the national aspirations of any people. Col. House urged him to strike off a quick general peace, leaving details for later settlement; but this proved impossible, and formal conversations at Paris began only in Jan. 1919. The President succeeded in winning an early victory when he persuaded the conference to accept the principle of the League of Nations as the basis of the peace, and when the Commission on the League succeeded in completing by Feb. 14 the preliminary draft of the covenant. On returning to the United States, however, he found Republican opposition to the league strongly manifested in the Senate, although he had the support of Taft's influence in that party and in the country. Public opinion seemed to be uninstructed and apathetic as to the President's policies. Going back to Paris in March, he was able to secure the insertion in the covenant of certain amendments required by American sentiment. On Apr. 28 he won unanimous approval by the conference of the final draft of the covenant.

But he was confronted by the demands of the French, Italians and Japanese for territorial and economic concessions from the enemy, which he regarded as excessive. Long discussions followed, culminating in Wilson's acceptance of a portion of the Allied demands, notably the granting of Shantung to the Japanese, of much of the frontier line promised by the Treaty of London to Italy, the separation of the Saar from Germany and the exaction from Germany of what amounted to a blank cheque in the matter of reparations. Such concessions aroused the opposition of liberals in England and America, who insisted that the President had surrendered his principles. Wilson, on the other hand, acknowledging that certain aspects of the settlement were not ideal, believed that he had won his main contention in securing the League of Nations, which provided the mechanism for eradicating the vices contained in the treaties. In this belief he was supported by another liberal protagonist, Gen. Smuts. On June 29, 1919, the day following the signing of the Versailles Treaty, the President sailed for America. His international prestige had suffered from his opposition to national claims, especially that of the Italians to Fiume and of the French to the left bank of the Rhine. His prestige as a liberal leader had also suffered from his failure to achieve the peace of conciliation which he had promised. This failure was due to the lack of any spirit of conciliation in Europe which might inspire a new sort of peace settlement. As Col. House wrote in his diary, the day after the signing of peace, "I should have preferred a different peace, I doubt whether it could have been made, for the ingredients for such a peace as I would have had were lacking at Paris." The single great creative accomplishment of the Peace Conference, the League of Nations, resulted primarily from Wilson's leadership.

The strain of the conference had told upon Wilson's physical and nervous strength. He was thus not well equipped to wage the struggle with his Republican opponents in the Senate which developed upon his presentation of the treaty. Had the President been willing to compromise and accept reservations to the covenant of the league, it is likely that the two-thirds necessary to ratification would have been secured. This course he refused to follow, and it soon became clear that the Foreign Relations Committee would not recommend ratification without serious reservations or amendments. In the hope of winning popular support, the President set forth upon a tour of the country, and along the Pacific coast aroused enthusiasm in marked contrast to the coldness of the East. The effort, however, overtaxed his strength, and on Sept. 26 at Wichita, Kan., the President was compelled to give over his tour and return to Washington, where he suffered a complete nervous collapse. The exact nature of his illness was not made public and few realised how serious it would prove to be. Many, however, felt that in view of his inevitable abstention from active work it would have been wiser for him to retire at least temporarily. As it was, his system had provided for no understudy and the administration was left without a leader.

Entirely apart from the confusion thus caused in the conduct of public business, Wilson's illness led directly to the defeat of the treaty. There was no one else available either for leading the fight for ratification without reservations, or with sufficient authority to arrange a compromise. On Nov. 13 the Senate adopted reservations which Wilson declared would "nullify" (etc., etc.) the treaty; for this reason he urged the Democrats to refuse to vote for the ratifying resolution, which was accordingly defeated on Nov. 19, 1919. During the succeeding weeks efforts were made to arrange a compromise. The Republican leaders agreed to soften the language of certain reservations, and the President intimated that he would accept a mild reservation on Article X. of the covenant, which had aroused the chief opposition. Neither side would yield enough, and when on March 19, 1920, the final vote was taken on the ratifying resolution, which contained a strong reservation on Article X., Wilson again urged Democratic senators not to accept. The resolution thus failed of the necessary two-thirds by a margin of six votes, 57–37. The President appealed to the autumn presidential election in 1920 as the decisive plebiscite. Although he had lost his former control of the party, and the Democratic presidential nominee at San Francisco was not his choice, the Wilsonian policies, including approval of the League of Nations, were inevitably the issue of the elections. In the electioneering campaign, however, the President himself could take no active part, for his physical collapse proved so serious as to confine him to the White House. For the overwhelming victory won by the Republicans, *see* UNITED STATES: *History*. After his defeat Wilson kept close silence on public matters, and his annual message of Dec. 1920,

[1]The Fourteen Points are set forth in full in an article on that subject.

while it sounded the note of national duty, made no reference to that which lay nearest his heart—the League of Nations. This silence, indeed, he preserved until the close of his administration, March 4, 1921. In Dec. 1920 he had been awarded the Nobel Peace prize.

After his retirement from office Wilson lived quietly in Washington, refraining from all political comment. He appeared to greet his admirers on Armistice Day, 1923, with a short speech from the porch of his house. For months he had been growing weaker, and on Feb. 3, 1924, he died in his sleep.

The failure of President Wilson to win the approval of the United States for his peace policies presents one of the most interesting problems of American history. He had led the country through the difficult period of a war unsurpassed in magnitude and culminating in complete victory; in the face of serious obstacles he had forced European statesmen to accept the major item in his programme; he returned home only to be repudiated by his own people. Personal and partisan factors unquestionably contributed to his defeat. In private intercourse Wilson displayed a personal magnetism, a breadth of culture and a genial cordiality that are amply attested by his intimates. But in public life he proved unable to capitalise such advantages, possibly because of natural shyness, possibly because physical delicacy restricted his social activities. Roosevelt's capacity for "mixing" with all political and human types he totally lacked. In the formation of his policies he isolated himself and was unable to establish close relations with Congressional leaders. This gave rise to the impression that the President disliked advice, was an egocentric autocrat and immediately dispensed with anyone who disagreed with him. Such criticism, by no means a novelty in the case of strong-willed presidents, was utilised by his political opponents and intensified his unpopularity in the industrial centres, especially of the East, an unpopularity which, except for a brief period during the opening months of the war, was an outstanding factor in the political situation. Broadly speaking, the criticism does not seem to be fully justified. In matters of what he regarded as principle he was adamant, and he distrusted the judgment of those whose basic point of view was different from his own; but the evidence of those who worked with him, including that of Republican advisers at Paris, is almost unanimously agreed that he was anxious to secure advice, was tolerant of opinions, and glad to delegate responsibility. The contrary belief was doubtless fostered by Wilson's inability to build up an efficient secretarial organisation, and his incapacity, rather than unwillingness, to apportion effectively the details of administrative labour. His handling of war problems shows clearly his desire to delegate responsibility; once an appointment was made he refused to interfere and consistently protected his appointee from the importunities of politicians.

Political responsibility in general, he believed, should rest with the President. From conviction, rather than from egotism, he sought to emancipate the presidential office from the control of Congressional committees, a control which he earnestly deplored in his earliest writings. The President, he felt, should be the real leader of the nation, and not a mere executive superintendent. The cabinet he looked on as an executive and not as a political council, and it was always strictly subordinated to his policies. So long as the Democrats held the majority in Congress he was able to translate such ideas into fact, and effectively disposed of all attempted Congressional revolts. This attitude naturally did not allay the political resentments which were inevitably aroused and which were intensified by Wilson's tendency to regard political opposition as tantamount to personal hostility; when the Democratic majority disappeared he faced uncompromising hostility. He was intensely impatient of partisan obstruction of his idealistic plans, and there is much of the Calvinist in his refusal to temporise or deviate from the path which he believed himself appointed to tread. While in matters of detail he showed at times some capacity for compromise, in matters of principle he displayed the unswerving determination characteristic of the prophet, a trait that is not always conducive to success in the exigencies of modern party warfare. Indeed it is as a prophet rather than as a statesman that Wilson should be regarded. No one has preached more impressively and effectively the necessity of introducing a moral standard into international politics.

The following are the most important writings of President Wilson: *Congressional Government, a Study in American Politics* (1885); *The State—Elements of Historical and Practical Politics* (1889); *Division and Reunion, 1829–89* (1893); *An Old Master and Other Political Essays* (1893); *Mere Literature and Other Essays* (1893); *George Washington* (1897); *A History of the American People* (1902); *Constitutional Government in the United States* (1908); *The New Freedom* (1913); *On Being Human* (1916); *International Ideals* (1919). The authorized biography is by Ray S. Baker, *Woodrow Wilson, Life and Letters* (1927–). Biographies based upon personal contact with Mr. Wilson have been written by W. E. Dodd, *Woodrow Wilson and His Work* (1921); by his private secretary, Joseph P. Tumulty, *Woodrow Wilson as I Know Him* (1922); by Josephus Daniels, *Life of Woodrow Wilson* (1924); and by David F. Houston, *Eight Years with Wilson's Cabinet* (2 vols., 1926). Critically appreciative biographies are: David Lawrence, *The True Story of Woodrow Wilson* (1924), and William Allen White, *Woodrow Wilson, the Man, his Times, and his Task* (1924). A less friendly interpretation, valuable for Wilson's Princeton career, is Robert E. Annin, *Woodrow Wilson; a Character Study* (1924). Wilson's work at the Peace Conference is favorably presented by Ray S. Baker, *Woodrow Wilson and World Settlement* (1923). A documented exposition of Wilson's character and policies is found in *The Intimate Papers of Colonel House*, arranged as a narrative by Charles Seymour (4 vols., 1926–28). General surveys of Wilson's foreign policy are to be found in E. E. Robinson and V. J. West's *The Foreign Policy of President Wilson, 1913–17* (1918), and in Charles Seymour's *Woodrow Wilson and the World War* (1920). In *Beacon Lights of History* (1924), P. W. Wilson gives a close analysis of Wilson's character and career. The authorized edition of President Wilson's state papers and addresses is *The Public Papers of Woodrow Wilson*, edited by Ray S. Baker and William E. Dodd (1925). (C. SEY.)

WILSON, a town of North Carolina, U.S.A., the county seat of Wilson county; 42 m. E.S.E. of Raleigh, on Federal highways 17-1 and 217, and served by the Atlantic Coast Line and the Norfolk Southern railways. Pop. 10,612 in 1920 (49% negroes); estimated locally at over 15,000 in 1928. It is one of the largest tobacco markets in the world. Wilson was incorporated in 1849. Its first sale of leaf tobacco took place in 1890.

WILSON AND CO., INC., incorporated under the laws of the State of Delaware, is one of the so-called Big Four of the American meat-packing concerns. Its history goes back to 1853 when its founders started a local abattoir in New York city, gradually expanding its local activities until by the purchase of a plant in Kansas City, in 1891 it entered the field of interstate and world-wide distribution of meats and meat products. In 1902 the building of a plant in Chicago, the centre of the live stock industry of the United States, in 1913 the acquisition of a plant in Argentine and finally the building of a plant in São Paulo, Brazil in 1918 are the most noticeable milestones in the development of this company.

In 1928 its annual sales directly to retailers and wholesalers and through branch houses or agencies in the United States, Europe, Central and South America were approximately $300,000,000. Its plants located at various strategic points in the live stock centres in North and South America, prepare not only meats and kindred food products for human consumption but also produce, from intensive utilization of by-products, the raw materials for many other industries. In addition to the minute inspection of all meat products under the supervision of the U.S. Department of Agriculture, research laboratories are attached to each plant, carrying on constant bacteriological tests of food products, developing new uses for by-products and enlarging the scope of the company's world-wide activities. (T. E. WI.)

WILSON CLOUD CHAMBER, a method, due to C. T. R. Wilson, for rendering visible the tracks of swift electrified particles, which has proved of the greatest importance for recent researches in atomic physics. By a special device minute drops of water are made to condense on the ions produced by a particle in its rapid passage: the trail of droplets is dense enough to be visible to the eye as a white line, and is usually recorded by photography, for subsequent study. The particles whose behaviour is studied by the method are the α-particles (*see* RADIOACTIVITY), and swift electrons, which may be either β-particles

(*see* RADIOACTIVITY) or electrons released by the photoelectric action of X-rays. (*See* PHOTOELECTRICITY, X-RAYS.) Many properties of the X-rays themselves are revealed by the tracks of these secondary electrons.

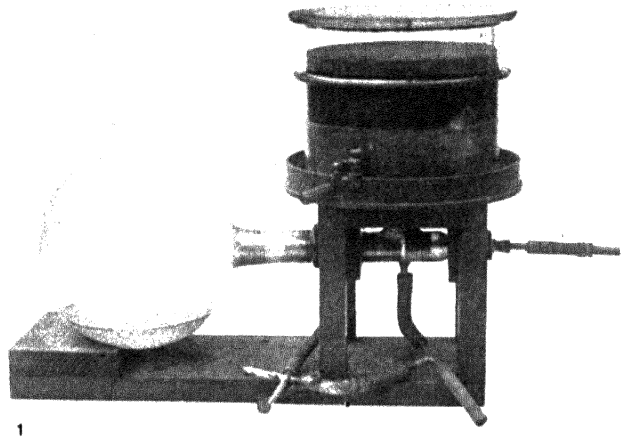
The Condensation of Supersaturated Vapours.—Air saturated with moisture can be cooled until a very high degree of supersaturation is reached—that is, until the amount of water which it contains in the form of vapour is much greater than suffices to saturate it, once condensation has been started—if there are no particles in it to act as nuclei round which droplets can form. (The term nucleus used with regard to condensation merely means a centre or core round which vapour molecules collect to form a liquid layer, and has nothing to do with the exceedingly minute structure which is called the nucleus of the atom.) Aitken, in his investigations from 1880 onwards, had showed that dust particles could act as such nuclei, and had utilised this fact to count dust particles. Early workers, such as Lenard and Wolff, who found that ultra-violet light falling on a zinc plate could produce condensation in a steam jet attributed the effect, actually due to the electrons thus liberated, to dust. In 1890 R. von Helmholtz and F. Richarz attributed the condensation of a steam jet by a point discharge to the formation of ions, and in 1896 Richarz found that X-rays could produce condensation in the steam jet, without, however, pursuing the subject. Serious study of the condensation on ions was begun in 1896 by C. T. R. Wilson, when he found that the ions formed in gases by X-rays could act as centres of condensation in moist air in a state of supersaturation. A little later he showed that the rays from radioactive substances, ultra-violet light, and other agents which produce ions lead to the same effect. That the condensation was actually due to the ions, and not to some other action of the rays, was proved by applying an electric field before the conditions necessary for condensation were produced: this removed the ions, and at the same time stopped the formation of a cloud of moisture.

Wilson produced his cooling of the air, kept saturated at the initial temperature by the presence of liquid water, by a rapid, approximately adiabatic, expansion: this was effected by the sudden withdrawal, through a controlled distance, of a glass plunger fitting the closed tube in which the condensation was produced. He found that, once dust particles had been removed by repeatedly expanding, and allowing the drops to settle, no condensation could be produced unless the ratio of expansion v_2/v_1 (where v_2 is the final, v_1 the initial volume) exceeded a certain threshold value, namely 1·25. This corresponds to a supersaturation of about 4·2, the supersaturation S, defined as the ratio of the amount of water vapour present to that required to produce saturation at the prevailing temperature, being given by the formula

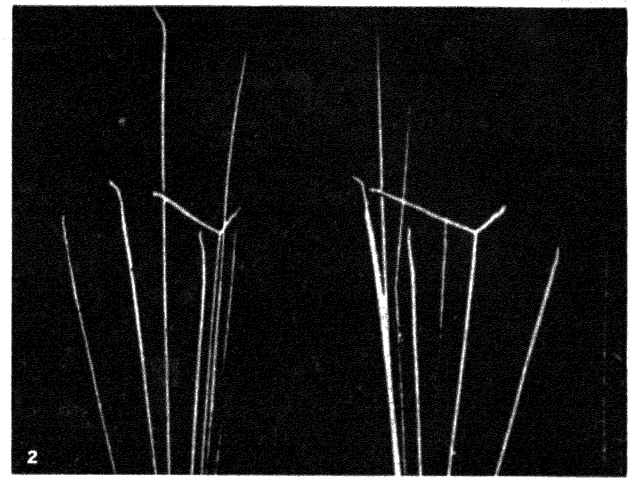
$$S = \frac{\pi_1 v_1 T_2}{\pi_2 v_2 T_1}$$

where T_1 and T_2 are the temperatures before and just after expansion, and π_1 and π_2 are the vapour pressure of water at those temperatures; by a familiar expression $T_1/T_2 = (v_2/v_1)\gamma^{-1}$ where γ is the ratio of the specific heat at constant pressure to the specific heat at constant volume, for air. With an expansion ratio exceeding 1·25 a few drops are produced in dust-free air; with an expansion ratio exceeding 1·38 a dense cloudy condensation is produced, but in this case the supersaturation is about 8. The essential observation made by Wilson was that when ions were produced in the air by the action of X-rays or any other agent, a fog was formed with an expansion ratio 1·25, in place of the few drops, due to residual ions, formed when there was no radiation. The density of the cloud depends upon the strength of the radiation, but no cloud at all is formed unless the expansion equals or exceeds 1·25. Wilson showed that positive and negative ions are not equally effective as nuclei of condensation; whereas the negative ions begin to act as nuclei at the ratio just specified, namely 1·25, positive ions do not become effective until the expansion ratio is 1·31, which corresponds to 6-fold saturation.

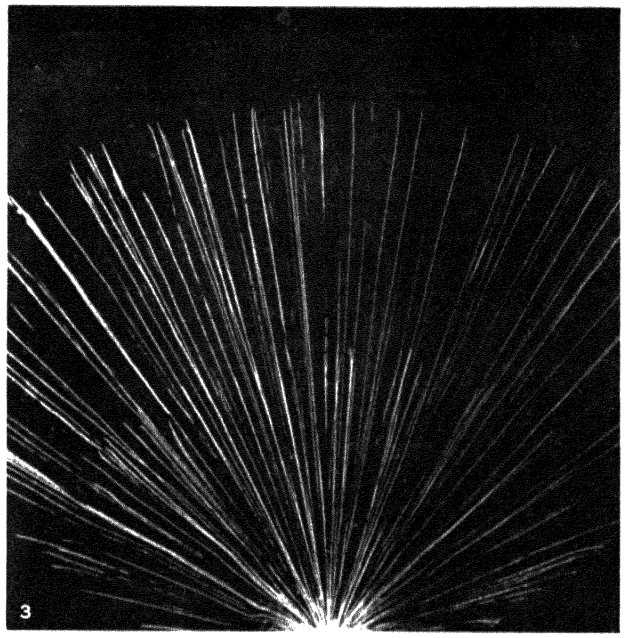
The efficacy of charged ions as nuclei of condensation is bound up with the question of the evaporation of drops of different sizes in a saturated atmosphere, for a droplet can only form if there is a tendency for liquid to deposit on it from the vapour state rather than for its liquid to pass into vapour. It was shown by Lord Kelvin that the vapour pressure p at a surface of radius of curvature r differs from the vapour pressure P at a plane surface in a way given by the equation



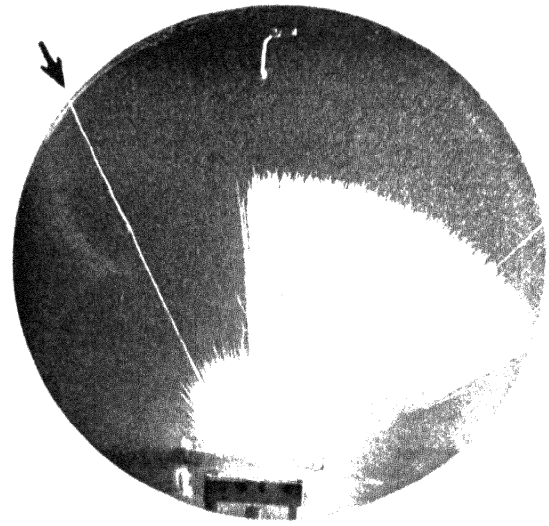
$$\sigma RT \log \frac{p}{P} = \frac{2\alpha}{r}$$



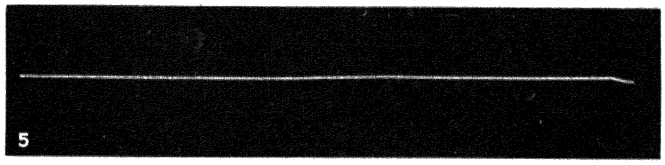
where σ is the density of the liquid, R the gas constant for unit mass of vapour, and α the surface tension. The vapour pressure at the surface of a spherical drop being greater than that at a plane surface the drop will tend to evaporate, in an atmosphere of saturated vapour, which is in equilibrium with a plane surface, and it will only be stable, or tend to grow, if there is a supersaturation equal to or greater than p/P as given by the above formula, showing a dependence on r. The effect of charging the droplet electrically is to diminish the tendency to evaporate, as can be seen by considering that the electrical capacity of a sphere is proportional to the radius, and hence the electrical energy, with a given charge, inversely as the radius, so that the diminution in size of a charged drop requires, in respect of the electric forces, a supply of energy, and will not take place under conditions in which an uncharged drop of the same size may evaporate. J. J. Thomson worked out the theory in detail, and showed, by thermodynamic reasoning, that the above formula becomes, for a drop carrying a charge e,



$$\sigma RT \log \frac{p}{P} = \frac{2\alpha}{r} - \frac{e^2}{8\pi r^4}.$$



While for uncharged drops the supersaturation required to produce condensation on a droplet increases steadily as r is diminished, for a charged drop, as shown by this formula, $S = p/P$ has a maximum at a radius approximately 6×10^{-8} cm., and then decreases. A droplet of radius 4×10^{-8} cm. is in equilibrium with saturated vapour above a plane surface, and so droplets of any smaller size grow automatically to this size without supersaturation. The maximum value of S, at $r = 6\times10^{-8}$ cm., works out to be about 4·2, so that for this supersaturation, or any greater value, a droplet once begun will grow large. This agrees excellently with the value found by C. T. R. Wilson for condensation on negative ions: the different value found for positive ions requires subsidiary hypotheses, which are not altogether satisfactory, to explain it. The above numerical values are all for the case of water vapour. Experiments have been carried out with other vapours, and the values obtained for the limiting expansion agree well, on the whole, with J. J. Thomson's theory. It may be noted, as indicating the difficulties of a complete explanation, that the relative efficiency of positive and negative ions is reversed, as compared to water vapour, for the vapours of the organic liquids tested.



The Apparatus for Obtaining Cloud Tracks.—For the successful application of the method it is necessary, firstly, to produce the expansion in such a way as not to stir up the gas, and so distort the trails of water drops which record the paths of the particles, and, secondly, to ensure that before the passage of the particle in ions or other condensation nuclei are present. To ensure the fulfilment of the first condition the body of the apparatus is made in the form of a circular cylinder, with the axis vertical, and the expansion effected by the movement of a close-fitting cylindrical piston. The upper part of the cylinder, which constitutes the walls of the chamber itself, is of glass, and it is closed at the top by a glass plate, so that observation can be made vertically or horizontally. The movement of the piston, the extent of which is controlled by contact with the floor of the chamber, is produced by a sudden lowering of pressure of the air under the piston, brought about by connecting the space beneath the cylinder with an evacuated vessel. Plate I., fig. 1, represents the actual chamber used by C. T. R. Wilson from 1911 until the present day (1929); the evacuated vessel is seen on the right, communication being established by the opening of a valve, which leaves a wide passage free. The diameter of this particular cham-

MAKING VISIBLE THE PATHS OF β PARTICLES, AND OF ELECTRONS RELEASED BY THE ACTION OF X-RAYS

1. Passage of a beam of X-rays through a silver plate, showing absorption of primary beam and characteristic radiation from plate
2. Track of a slower electron, magnified to show individual droplets
3. β-ray track, starting on left, showing initial straight portion, nuclear deflection, branches and curvature in later portion of track
4. Weak X-ray radiation, falling on a copper plate showing one electron ejected from the copper and one electron ejected from a gaseous atom by the X-radiation from the copper
5. Passage of hard X-rays through air, showing different types of electron tracks produced

ber is 16·5 cm. with the depth about 3 cm. In his earlier experiments Wilson coated the inner surfaces of the roof and sides with a thin layer of gelatine, to prevent the formation of droplets on these surfaces, but he now prefers to keep the base of the chamber slightly colder than the rest by sending a slow stream of tap water through the shallow receptacle in which the expansion cylinder rests; this is perfectly effective in keeping walls and roof clear, even when no gelatine is used. The base of the chamber, that is, the upper surface of the piston, is coated with a layer of blackened gelatine, the gelatine keeping the air saturated with water vapour, while the black shows up the cloud tracks. The apparatus has been variously modified by other workers since: for instance, Shimizu, who used a chamber only 6 cm. in diameter, found that perfect tracks could be obtained when the piston was given a reciprocating motion by a simple mechanical device. The frequency of the motion may be as high as 3 oscillations a second, which permits a large number of photographs to be rapidly taken. This form of apparatus was used by Blackett to obtain the pictures to be mentioned later, specimens of which are given in Plate I., figs. 2, 6, and 7.

Any dust particles which would act as condensation nuclei are removed by a run of preliminary expansions. To remove the stray ions a vertical electrical field is maintained between a marginal ring of tin-foil, cemented between roof or walls and the top of the piston: this field is about 3 volts per cm., which, while it suffices to remove ions, does not produce sufficient movement of the heavy drops to disturb the tracks.

To obtain satisfactory pictures, it is necessary to control carefully the sequence of the three events:—admission of ionising particles or radiation; expansion; and the flash of light by which the photographs are taken. The rays should traverse the chamber immediately after the sudden expansion of the gas, and the illumination, from the side, should occur after a very short interval. Wilson's method is to produce the illuminating flash by the discharge of a Leyden jar through mercury vapour at atmospheric pressure, the flash of X-rays by the discharge of a Leyden jar through the X-ray tube, and to effect the timing by three pendulums, of adjustable period, all released simultaneously. The first produces the expansion by opening the passage between the space beneath the piston and the evacuated vessel: the second discharges the jar through the X-ray tube and the third the jar through the mercury spark gap. When the tracks of α or β-particles are to be recorded the particles are admitted into the chamber at the right time by a little mechanical shutter, controlled by the second pendulum.

When it is desired, for purposes of measurement, to know the direction of the tracks in space, one photograph, which merely gives the projection of the track on a single plane, is not sufficient. Two photographs of the same tracks must be obtained, either stereoscopically or from two directions at right angles: the latter arrangement is easily obtained with a single camera lens and plate by a suitable arrangement of mirrors. Examples of such double photographs are given in Plate I., figs. 2, 6, and 7. From these it is a matter of simple geometry to obtain the true angles between the different branches in the case of a forked track, or any other directional property of the track.

Applications of the Method.—In Wilson's first photographs, published in 1912, certain of the α-ray tracks showed a sharp change of direction towards the end of the path, an example being given in Plate I., fig. 5. This change of direction was a brilliant confirmation of Rutherford's theory of single scattering. (*See* NUCLEUS.) At the point where the change of direction takes place, the track shows a little spur, pointing away from the direction in which the track is bent. This spur, which is barely visible in Plate I., fig. 5, but much more distinct with tracks showing a bigger deflection of the α-particle, is due to ionisation produced by the nucleus which is struck by the α-particle. This method of recording the single scattering of α-particles has been developed by Blackett, who, in the course of a large number of photographs, has obtained some striking examples of forked tracks, showing the path of both α-particle and struck nucleus after collision. Double photographs, from directions at right angles were taken, to enable the angles to be calculated. Plate I., fig. 2, is a pair of photographs of α-particle tracks in oxygen, showing a fork due to nuclear collision: the shorter branch of the fork is made by the struck oxygen nucleus. Plate I., fig. 7, shows a magnificent example of a forked track in helium, where the masses of striking and struck particle are equal. For a discussion of these photographs *see* NUCLEUS.

The method has been used to study many other phenomena attending the passage of α-rays. Rutherford, by the method of scintillations, found that swift α-particles can dislodge a proton from certain types of nucleus, notably the nitrogen nucleus. Plate I., fig. 6, shows a pair of photographs of α-ray tracks in nitrogen, taken by Blackett, actually recording the expulsion of the proton. The path of the expelled proton is shown by the very fine track which appears as a continuation of the γ-ray track which is on the extreme left in the left-hand photograph, and on the extreme left but one in the right-hand photograph. These experiments are discussed in NUCLEUS. The ejection of a proton at high speed from a film of paraffin wax is shown in Plate I., fig. 4, due to Meitner: this proton comes, of course, not from a complex nucleus, but from a hydrogen atom of the wax. Half of the bundle of α-particles passes through the film of wax, and consequently appears with diminished range: the single long fine track is due to the proton expelled.

The method can clearly be applied to the study of the ranges of individual α-particles, and has been used for this purpose by Mme. Curie and by Meitner. A pretty example of a general record of ranges is offered by Plate I., fig. 3, due to Chadwick and Emeléus: it is a photograph of the tracks of α-particles from thorium C+C′, and shows very clearly the two distinct ranges, the shorter attributed to Thorium C itself, the longer to Thorium C′. (*See* RADIOACTIVITY.) Many effects associated with the α-particles, which were established by less direct evidence, can be made evident by the use of the cloud chamber: for instance, the recoil of the radioactive atom when it discharges an α-particle is clearly shown in some of Wilson's pictures taken with a trace of Thorium emanation in the chamber, for at the beginning of the track of the α-particle is a short clearly defined spur, pointing in the opposite direction, due to the ionisation produced by the atom itself. The same photographs show further the short life of the atom of Thorium A (half-value period ·14 sec.), for the ray tracks occur in pairs, one due to an atom of Thorium emanation ejecting an α-particle and becoming an atom of Thorium A, and the other due to the ejection, within a fraction of a second, of an α-particle by the atom of Thorium A. The slow electrons (sometimes called δ-particles) ejected by the α-particle from atoms of the gas through which it passes (*see* RADIOACTIVITY) appear on enlarged photographs of tracks taken at reduced pressure as short projections, like tiny hairs, on the early part of the tracks.

The properties of the β-rays have also been elucidated by the cloud chamber. Plate II., fig. 2, is the track of a slower β-particle, magnified to show the individual droplets. It will be seen that these occur partly in pairs of single droplets, corresponding to positive and negative ions produced, and partly in groups, the groups being due to the ionisation produced by secondary electrons, that is, by electrons released from atoms by the electrons of the primary beams. The track of a swift β-particle is quite straight as long as it retains something like its initial velocity, but becomes curved in random directions as the particle loses speed. Plate II., fig. 3, shows a typical track: the initial portion is quite straight, but suffers a sudden large change of direction, which is due to close approach to a nucleus—Rutherford's "single scattering." (*See* NUCLEUS.) The track continues straight for a short distance after the deflection, but then takes on gradually increasing curvatures, due to accumulated small deflections—"multiple scattering." It also exhibits branches, due to the ionisation produced by comparatively swift secondary electrons. Photographs have also been obtained showing forked β-ray tracks, due to the collision of the β-particle with an atomic electron, both electrons producing ionisation after the impact.

The photographs of the tracks produced by the electrons lib-

erated by X-rays have yielded very valuable results. A good general idea of the appearance produced by a beam of X-rays is afforded by Plate II., fig. 1, which is a little less than natural size. The X-rays come from the right, and traverse a plate of silver in the middle of the ionisation chamber. Before passing through the plate the tracks of the electron released form so dense a mass that the individual tracks cannot be seen: passage through the silver weakens the beam sufficiently for the separate tracks to be distinguished. The intense patch of tracks round the silver plate is due to radiations emitted by the copper under the influence of the primary beam. The picture serves to emphasize that the ionisation produced by X-rays is a secondary effect due to the electrons which they eject from the atoms of the gases in their path. Careful measurement of the tracks of electrons ejected by the characteristic K radiations from selected metals (*see* X-RAYS) have enabled close estimates to be made of the range in air of electrons corresponding to a given voltage.

The quantum theory has been strikingly illustrated by cloud tracks. Plate II., fig. 4, shows the result of a very weak X-radiation falling on a copper plate. A single electron track will be seen coming from the plate, and another single electron track starting from a gaseous atom; such pairs have been frequently photographed. They are simply explained by attributing the first track to an electron ejected, by the action of the primary beam, from the K level of a copper atom, which must then adjust its electron levels with emission of a quantum of copper K-radiations. (*See* X-RAYS; QUANTUM THEORY.) The other electron track must be due to an electron ejected from an oxygen or nitrogen atom by this quantum of radiation. The method has thus rendered visible the tracks of two electrons, associated respectively with the emission and absorption of a single quantum of X-radiation.

The passage of hard X-rays through a gas produces different types of electron tracks. Wilson distinguishes, besides the long tracks due to secondary electrons which have practically the full energy $h\nu$, and have already been discussed, "sphere," "comma," and "fish" tracks. Examples of all of these can be found in Plate II., fig. 5: the sphere tracks are simply white dots, the term comma is self-explanatory, and the fish tracks are the short curved tracks with one end thicker than the other—fish swimming in the direction in which the X-rays are travelling. These short tracks are due to comparatively slow electrons, and the different forms are easily explained if it is remembered that the intensity of ionisation increases as the speed of the electron diminishes. A very slow electron will be deviated through very large angles in a very short path, and will produce large ionisations, making a little patch of droplets, or sphere track; a somewhat faster electron will have a more clearly defined line as its initial portion, and will form a "comma"; while an electron with slightly greater speed will present the form of an elongated comma, or "fish." These short tracks appear in appreciable numbers only when the primary X-radiation is very hard, and all their peculiarities are easily explained in terms of the Compton effect, of whose validity they offer strong confirmation. In the Compton effect a quantum of X-radiation interacts with an atom on which it falls in such a way that a quantum of softer radiation is scattered, the balance of energy appearing as kinetic energy of an electron. The energy of this so-called recoil electron depends upon its direction, which is bound up with the direction of scattering of the quantum of radiation, and is greatest when the electron proceeds in the direction of the incident rays. This accounts at once for the fact that the fish tracks all have their heads away from the source of radiation, as if swimming with the stream. The sphere tracks are due to recoil electrons of low initial velocities, thrown off at right angles, say, and the commas constitute an intermediate class. For further details, *see* the article COMPTON EFFECT. Many measurements on long and short tracks, by A. H. Compton and A. W. Simon, J. M. Nuttall and Williams and others, have confirmed the theory put forward by Compton.

Further references to the use of the Wilson Cloud Chamber will be found in the articles COMPTON EFFECT, PHOTOELECTRICITY, NUCLEUS, RADIOACTIVITY.

Richarz, *Uber Wirkung der Röntgenstrahlen auf den Dampfstrahl,* Annalen der Physik, 59, 592, 1896. A collected account, with full references, of the early work on condensation on nuclei is given by K. Przibram, *Die Untersuchungen über die Kondensation von Dämpfen an Kernen,* Jahrbuch der Radioaktivität, 8, 285 (1911). For the theory of the condensation on ions, and a general account of C. T. R. Wilson's work, *see* J. J. Thomson and G. P. Thomson, *Conduction of Electricity through Gases,* Vol. 1. (1928). C. T. R. Wilson's chief papers are: *On Condensation of Water Vapour in the Presence of Dust-free Air,* Philosophical Transactions, Royal Society, 189, 265 (1897); *On a Method of Making Visible the Paths of Ionising Particles through a Gas,* Proceedings Royal Society A. 85, 285 (1911); *On an Expansion Method for making Visible the Tracks of Ionising Particles in Gases and some Results obtained by its Use,* Proceedings Royal Society, A. 87, 277 (1912); *On Some α-Ray Tracks,* Proceedings Cambridge Philosophical Society, 21, 205 (1922); *Investigations on X-Rays and β-Rays by the Cloud Method,* Proceedings Royal Society, A. 104, 1, 1923, A. 104, 192 (1923). Beautiful examples of α-ray tracks taken by the Wilson method are published by L. Meitner and K. Freitag, *Über die α-Strahlen des Th C + C' und ihr Verhalten beim Durchgang durch verschiedene Gase,* Zeitschrift für Physik. 37, 481 (1926). A general account of C. T. R. Wilson's work on the cloud chamber is given in his discourse *On the Cloud Method of Making Visible Ions and the Tracks of Ionising Particles,* delivered in 1927 on the occasion of his receiving the Nobel Prize, and published in *Les Prix Nobel* (1927).

(E. N. DA C. A.)

WILTON, a market town and municipal borough in the Salisbury parliamentary division of Wiltshire, England, 86 m. W. by S. of London, on the S. and G.W. railways. Pop. (1921) 2,021. It lies among the pastures beside the rivers Nadder and Wylye. The Wilton house, a little to the south, was founded by William Herbert, first earl of Pembroke by the second creation, on the estates of the dissolved convent which were granted him by Henry VIII., and rebuilt later, part of it being designed by Inigo Jones. Tradition has it that Shakespeare and his company played here before James I. in 1603, and the house is rich in memories of Sir Philip Sidney, Holbein and Vandyck, Jonson and Massinger.

Carpet-making forms the main industry of Wilton; the most famous fabrics being those known as Wilton carpets; Brussels carpets; Saxony carpets made of short-staple wool; and the rich and durable Axminsters, long woven by hand at Axminster in Devon. It is also an important centre for the sale of sheep.

A chantry was founded here about A.D. 800, afterwards changed into a priory of Benedictine sisters. It was refounded by Alfred and lasted until the dissolution of the monasteries. Antiquaries have seen in Wilton the capital of a British kingdom. It was certainly the chief town of the Wilsaetas, or men of Wilts, whom Cynric the Saxon leader crushed in 556. It afterwards became a residence of the Wessex kings; and here, in 871, Alfred was severely defeated by the Danes. Wilton was burned in 1003 by Sweyn, the Danish king. In 1141 Queen Matilda celebrated Easter here with great pomp, and two years later Stephen, who came to found a castle, was driven off by her adherents. The prosperity of Wilton began to fail when Icknield Street, the great highway of commerce, was diverted to pass through Salisbury in 1224; and its decline was hastened by the plague, by which a third of the townsfolk were swept away in 1349.

Two members were returned to parliament from 1293 to 1832 and one from 1832 to 1885, at which date Wilton lost its separate representation. The September sheep fair is one of the largest in England.

WILTSHIRE, a county of England, bounded north-west and north by Gloucestershire, north-east and east by Berkshire, south-east by Hampshire, south-west and south by Dorsetshire, and west by Somersetshire. Area 1,374·9 sq. miles. About two-thirds is chalk upland, and the remainder is a series of clay plains and scarps bordering it on the north-west. The uplands consist of the broad western end of the Kennet syncline with drainage eastward of the Marlborough downs (400 ft.–900 ft. Inkpen beacon, on the borders of Berks, Wilts and Hants, 1,011 ft.); the narrow anticlines of Ham and of the Vale of Pewsey (200 ft.–400 ft.)

with drainage eastward to the head streams of the Salisbury Avon, and westward to tributaries of the Bristol Avon; the wide-rolling Salisbury plain (400 ft.–800 ft.), dipping to the south-east, though rising in Cranborne Chase on the south to 911 ft., and drained by the Salisbury Avon (rising near Bishops Cannings), the Wylye, the Nadder, the Ebble (draining the Vale of Chalk), and the Bourne (rising near Ludgershall), all of which unite at or near Salisbury.

The Tertiary rocks of the Hampshire basin rest upon the chalk uplands in the extreme south-east corner of the county, Reading beds and London clay east of Downton and on the Clarendon Hills; these are covered by Bagshot sands at Alderbury, Grimstead and Hampworth common; Tertiaries of the London basin appear as outliers south-east of Marlborough, Reading beds and London clay occurring round Great Bedwyn. The edge of the chalk uplands forms a scarp to the north-west, from beneath which outcrops a fringe of the Selbornian—Upper Greensand and Gault—the former is well exposed in the Vale of Pewsey, west of Devizes and marginally in the Vale of Wardour; it forms an elevated tract from Mere through Stourton to Warminster. Lower Greensand appears from beneath the Gault at Poulshot and follows the same line of outcrop northward; a small outlier at Seend is worked for iron. At Dinton in the Vale of Wardour the Wealden formation appears. The rest of the north-west area is occupied by Jurassic rocks, the following appearing in small outcrops: Purbeck limestones and clays at Teffont Evias, and Portland stone at Tisbury, south of Potterne and south of Swindon. Beyond the Lower Greensand lies a narrow belt of Kimmeridge clay from Semley to Mere (where it is faulted against the Cretaceous); Westbury to Seend; Calne to Swindon (where it is used for bricks).

Beyond the plain, rises the irregular scarp of the Corallian oolitic limestones and marks, and again beyond this, the Oxford clay and Kellaways beds of the Middle Oolite, forming a broad, low plain (known at its north-east end as the Vale of White Horse, draining north-eastward to the Thames) on which stand Trowbridge, Melksham, Chippenham and Cricklade, and which is drained by the Upper Bristol Avon flowing south-west. Bounding the plain is the rubbly Cornbrash, which outcrops at Westwood, Trowbridge and Malmesbury. This is succeeded further west by the Great Oolite series which includes the building-stones of Bath, quarried at Winsley down, near Bradford and at Box, Corsham down and elsewhere. Above the freestones near Bradford comes the Bradford clay (with fossil *Apiocrinus*) followed by the Forest Marble limestones and clays. Still further west follows a rim of Inferior Oolite and Fuller's earth giving place to upper lias in the valley of a tributary of the Avon near Box. Here and there, gravels and brick earths rest upon the older rocks.

Climate and Agriculture.—The downs of the uplands are mostly covered with coarse grass; the valleys are fertile and well-wooded. Three ancient forests remain: Savernake, south of Marlborough; Cranborne Chase (partly in Dorset) and No Man's Land and Hampworth common, which are outlying parts of the New Forest (Hants). There are also some fine parks. The lowlands and clay plains are mostly under grass for dairying purposes. Sheep are the basis of upland farming, but the milk demand of London and the local co-operative dairies are gradually converting more farms to dairying. Annual rainfall varies from 27 to 40 in., the temperature from 39° to 40° F in January and from 62° to 63° F in July. The winter climate is bleak.

History and Early Settlement.—Wiltshire was densely peopled at a very early period; and it is rich in pre-historic remains. Its most famous monument is Stonehenge (*q.v.*), 2 m. N.N.W. of Salisbury (which had a supposed wooden prototype "Woodhenge" about 2 m. to the north-east). At Avebury there are avenues of monoliths leading to what was once a stone circle, surrounded by an earthwork, and enclosing two lesser circles. A valley near Avebury is filled with immense Sarsen blocks, perhaps of pre-historic origin; there are also many menhirs and dolmens. Circles, formed by a ditch within a bank, are common, as also grave mounds or barrows. Plentiful traces of primitive agriculture are found in rectangular-shaped fields and lynchets or cultivation terraces on the hill sides.

Of ancient strongholds there are Vespasian's Camp, near Amesbury; Silbury hill, the largest artificial mound in Europe, near Avebury; the mounds of Marlborough and Old Sarum (an important road centre in Roman times and a mediaeval town of importance); the camps of Battlesbury and Scratchbury, near Warminster; Yarnbury, to the north of Wylye, in perfect preservation; Casterley, on a ridgeway about 7 m. E.S.E. of Devizes; Whitesheet and Winkelbury, overlooking the Vale of Chalk; Chisbury, near Savernake; Sidbury, near Ludgershall; and Figbury Ring, 3 m. N.E. of Salisbury. Ogbury, 6 m. N. of Salisbury is a British enclosure. Durrington walls, north of Amesbury, may be remains of a British village, and there are similar ones on Salisbury plain and Marlborough downs. Of Roman work, Wans dyke or Woden's dyke, one of the largest extant entrenchments, runs west for about 60 m. from a point east of Savernake nearly to the Bristol channel. Its date has often been discussed and it has been described as Romano-British and as post-Roman; it consists of a bank, with a trench on the north side and was clearly for defence; forts strengthened it at intervals. Bokerly dyke (part of the boundary between Wilts and Dorset) is the largest among several similar entrenchments, with a ditch north of the rampart.

Settlements on the Greensand consist of small scattered homesteads; on the Chalk there are compact villages along spring lines, and parishes lie in long narrow strips across the scarp so as to include hill pasture, and valley arable or meadow. Parishes originally in forest clearings seem to be characterized by churches placed centrally with roads radiating from them. The valleys also suggest downward migration of settlement from Chalk ridgeway to hillside road and, later, to lowland routes. Cynric's victory at Old Sarum (552) began the conquest of the present Wiltshire; his victory at Barbury hill in 556, extended the West Saxon kingdom to the Marlborough downs. At this period the district south of the Avon and the Nadder was dense woodland, of which Cranborne Chase survives and at first West Saxon colonization was chiefly confined to the valleys of the Avon and the Wylye. There was a definite administrative and territorial organization in the 9th century. Walstan, ealdorman of the Wilsaetan, being mentioned as repelling a Mercian invasion (800). "Wiltunscire" is mentioned by Asser (878) and in this year the Danes established their headquarters at Chippenham. In the time of Aethelstan mints existed at Old Sarum, Malmesbury, Wilton, Cricklade and Marlborough. Wilton and Salisbury were destroyed by the Danish invaders under Sweyn in 1003, and in 1015 the district was harried by Canute. After the Conquest more than two-fifths of the county fell to the church; one-fifth to the Crown.

In 1086, after the completion of Domesday, Salisbury was the scene of a great council, in which all the landholders took oaths of allegiance to the king, and a similar council assembled at Salisbury in 1116. At Clarendon in 1166 was drawn up the assize which remodelled the provincial administration of justice. Parliaments were held at Marlborough in 1267 and at Salisbury in 1328 and 1384. During the wars of Stephen, Salisbury, Devizes and Malmesbury were garrisoned by Roger, bishop of Salisbury, for the empress, but in 1138 Stephen seized the bishop and captured Devizes castle. In 1216 Marlborough castle was surrendered to Louis by Hugh de Neville. Hubert de Burgh escaped in 1233 from Devizes castle. In the Civil War, Wiltshire supported the Parliamentary cause, displaying a spirit of violent anti-Catholicism, and efforts to raise a party for the king met with resistance from the inhabitants. In the early stage of the struggle, Marlborough was captured for the king in 1642 while in 1643 the earl of Essex was routed by Charles I. and Prince Rupert at Aldbourne, and in the same year Waller, after failing to capture Devizes, was defeated in a skirmish at Roundway down. In 1645 the "Clubmen" of Dorset and Wiltshire were organized to punish any member of either party discovered plundering. Devizes, the last stronghold of the Royalists, was captured by Cromwell in 1645. In 1655 a rising organized on behalf of the king at Salisbury was dispersed.

At the time of Domesday Wiltshire was almost exclusively agricultural; 390 mills are mentioned, and vineyards at Tollard and Lacock. Under the Cistercians, sheep-farming developed, and in the 13th and 14th centuries the monasteries of Kingswood and

Stanlegh exported wool to the Florentine and Flemish markets. Wiltshire was among the chief of the clothing counties, the principal centres being Bradford, Malmesbury, Trowbridge, Devizes and Chippenham. In the 16th century Devizes was noted for its blankets, Warminster had a famous corn-market, and cheese was extensively made in north Wiltshire. Amesbury was famous for its tobacco pipes in the 16th century. The clothing trade went through a period of depression in the 17th century, partly owing to the constant outbreaks of plague. Linen, cotton, gloves and cutlery were also manufactured in the county, silk at Malmesbury, and carpets at Wilton.

Architecture.—Among the monastic buildings are the ruined Abbeys of Malmesbury and of Lacock near Melksham. There are traces of the hospital for leprous women (afterwards an Austin priory) at Maiden Bradley. Monkton Farleigh had its Cluniac priory, founded as a cell of Lewes in the 13th century. A college for a dean and 12 prebendaries, afterwards a monastery of Bonhommes, was founded in 1347 at Edington. The church, Decorated and Perpendicular, resembles a cathedral in size and beauty. The 14th century buildings of Bradenstoke priory or Cleck abbey, founded near Chippenham for Austin canons, are incorporated in a farmhouse. The finest churches of Wiltshire, generally Perpendicular, were built in districts of good stone, while the architecture is more simple in the Chalk region, where flint was used. Small wooden steeples and pyramidal bell-turrets are not uncommon; and the churches of Purton, 3½ m. N.W. of Swindon, and Wanborough, 3 m. S.E., have each two steeples, one in the centre, one at the west end. St. Lawrence's at Bradford-on-Avon is one of the most perfect Saxon churches in England. Three arches in the nave of Britford church, within a mile of Salisbury; the east end of the chancel at Burcombe, near Wilton; and parts of the churches at Bremhill, and at Manningford Bruce or Braose in the Vale of Pewsey are all Saxon work. Norman work is found in the churches of St. John and St. Mary, Devizes, the churches of Preshute, near Marlborough, Ditteridge or Ditcheridge, near Box, and Nether Avon, near Amesbury. Early English is illustrated by Salisbury cathedral, its purest and most beautiful example; and, on a smaller scale, at Amesbury, Bishops Cannings, Boyton in the Vale of the Wylye, Collingbourne Kingston, east of Salisbury plain, Downton and Potterne, near Devizes. Bishopstone, in the Vale of Chalk, has the finest Decorated church in the county. Mere, has a Perpendicular church, with a mediaeval chantry, used as a schoolhouse by Barnes, the Dorsetshire poet, as well as 14th century dwelling-houses.

The castles of Wiltshire have almost disappeared. At Old Sarum, Marlborough and Devizes only a few vestiges are left. Castle Combe and Trowbridge castle have long been demolished, and of Ludgershall castle only a small fragment survives. The ruins of Wardour castle (14th century) consist of a high hexagonal outer wall, enclosing an open court. The 18th century castle, one mile distant, is noteworthy for its collection of paintings, and, for the "Glastonbury Cup" said to be made of wood from the celebrated thorn. Place House, in Tisbury, and Barton farm, at Bradford, date from the 14th century. Fifteenth century work is best exemplified in the manor-houses of Norrington (Vale of Chalk); Teffont Evias (Vale of Nadder); Potterne; and Great Chaldfield, near Monkton Farleigh.

Manufactures and Communications.—Many hands are employed in the G. W. Railway locomotive works at Swindon. There are also large engineering works at Devizes. Cloth is still woven at Trowbridge, Melksham, Chippenham and other places where water-power is available. Carpets are woven at Wilton, haircloth and coco-nut fibre at Melksham, silk at Malmesbury, Mere and Warminster. Portland and Bath stone are quarried, while iron ore near Westbury is smelted in that town.

Three great railways traverse Wiltshire from east to west. In the north one main line of the G. W. Railway passes through Swindon from London to Bath; a second runs from Hungerford to Bath via Devizes. South of Salisbury plain the Southern main line goes through Salisbury into Somerset. Important branch lines of the G. W. Railway link up Salisbury and Westbury as also Cricklade, Swindon and Marlborough with the Southern Railway. Swindon, Salisbury and Westbury are the three centres of railway traffic. The Avon is navigable as far as Salisbury, and goods are carried on the Thames and Severn canal in the north-east and on the Kennet and Avon canal across Salisbury plain.

The area of the ancient county is 879,943 ac., with a pop. (1921) of 292,208. Area of the administrative county 864,101 acres. The municipal boroughs are: Calne, Chippenham, Devizes, Malmesbury, Marlborough, Salisbury, a city and the county town, Swindon, Wilton. The county is in the western circuit, and assizes are held at Salisbury and Devizes. It has one court of quarter sessions, and is divided into 16 petty sessional divisions. The boroughs of Devizes and Salisbury have separate courts of quarter sessions and commissions of the peace, and the borough of Marlborough has a separate commission of the peace. There are 335 civil parishes. Wiltshire is mainly in the diocese of Salisbury, but a considerable part is in that of Bristol, and small parts in those of Gloucester, Oxford and Winchester. It contains 322 ecclesiastical parishes or districts, wholly or in part. The county is divided into five parliamentary divisions. Chippenham, Devizes, Salisbury, Swindon, Westbury, each returning one member.

London, 1822–44); Aubrey's *Collections for Wiltshire,* edited by Sir T. Phillipps, pts. 1, 2 (London, 1821); Leland's *Journey through Wiltshire, A.D. 1540–1542,* with notes by J. E. Jackson (Devizes, 1875); W. H. Jones, *Domesday for Wiltshire* (Bath, 1865); John Britton, *The Beauties of Wiltshire* (3 vols., London, 1801–25); J. E. Jackson, *The Sheriff's Tourn, Co. Wilts. A.D. 1439* (Devizes, 1872); *see* also *Proceedings* of the Wiltshire Archaeological and Natural History Society; *Highways and Byways in Wiltshire,* ed. Hutton (1919).

WILUNA, a mining district and settlement in Western Australia, situated in the Central Division about an equal distance (*c.* 120 miles) east of Meekatharra and north by east of Sandstone, these mining settlements being at present the nearest railheads. (Meekatharra–Perth: 600 miles; Sandstone–Perth 575; Meekatharra–Geraldton: 334; Sandstone–Geraldton 309 miles, by rail.) Auriferous deposits of vast extent have been discovered here and the area is at present in process of vigorous development. The Wiluna Gold Corporation, which holds mining rights over nearly 1 sq. mile, has (1928) proved 1 million tons of 40/— ore within a relatively small portion of its area and it is reported that the values appear to increase with depth.

WIMBLEDON, a residential suburb of London, in Surrey, England, and adjoining the metropolitan borough of Wandsworth, 8 m. S.W. of Charing Cross. Pop. (1921) 61,418. Wimbledon has noted sports grounds, especially for tennis and cricket. Wimbledon (Wibbandune) is supposed to have been the scene of a battle in 568 between Ceawlin, king of Wessex, and Æthelbehrt, king of Kent, in which Aethelberht was defeated and an earthwork which existed on the common may have marked the site. At Coombe's hill and elsewhere British relics have been found. Wimbledon was incorporated in 1905.

WIMBORNE (Wimborne Minster), a market town, in the eastern parliamentary division of Dorsetshire, 111½ m. S. W. by W. from London; served by the Southern and the S. and L.M.S. joint railways. Pop. of urban district (1921) 3,743. It is situated on a gentle slope above the river Allen near its confluence with the Stour. The town depends chiefly on agriculture; but the manufacture of hose is carried on to a small extent, and there are also coachbuilding works.

Although Wimborne (*Wimburn*) has been identified with the *Vindogladia* of the Antonine Itinerary, the first undoubted evidence of settlement is the entry of the Anglo-Saxon Chronicle, under the date 718, that Cuthburh, sister of King Ine, founded the abbey here; to this the old church of St. Cuthburga belonged. The importance of the foundation made it the burial-place of King Aethelred in 871, and of King Sifferth in 962. Aethelwald siezed and fortified Wimborne in his revolt in 901 against Edward the Elder. The early abbey was probably destroyed by the Danes in the reign of Aethelred the Unready (978–1015), for in 1043 Edward the Confessor founded here a college of secular canons. The college remained unaltered until 1496, when Margaret, countess of Richmond, obtained letters patent from her son,

Henry VII., to found a chantry, in connection with which she established a school. The continuance of this was recommended by the commissioners of 1547, and in 1562 Elizabeth vested a great part of the property of the former college in a school corporation of twelve governors, who had charge of the church.

See John Hutchins, *The History and Antiquities of the County of Dorset* (3rd edition, Westminster, 1861); Anon., *History of Wimborne Minster* (London, 1860); Victoria County History of Dorset.

WINBURG, a town in the Orange Free State, 90 m. N.E. by rail of Bloemfontein. White population 1,250. It is built by the banks of a tributary of the Vet affluent of the Vaal, and is a trading centre for a large grain and pastoral district. It is joined to the trunk railway from Port Elizabeth to the Transvaal by a branch line from Smaldeel, 28 m. N.W. The town was founded in 1837 by Commandant H. Potgieter, one of the voortrekers, and was named by him in commemoration of a victory gained over the Matabele chief Mosilikatze. It became the capital of a quasi-independent Boer state. In 1848 the town and district were annexed to Great Britain and thereafter followed the fortune of the Orange river sovereignty. (*See* ORANGE FREE STATE.)

WINCHCOMB, a town in Gloucestershire, England, 7 m. N.E. of Cheltenham, among the Cotswold Hills, in the valley of the Isbourne stream. Pop. (1921) 2,741.

Excavations indicate both British and Roman settlements at Winchcomb. Here were founded religious houses by Offa and Coenwulf of Mercia (8th century). It became a borough in Saxon times, was the chief town of a shire of Winchcomb and the seat of government of the Mercian kings. Paper and silk factories were introduced about 1830.

The Perpendicular church of St. Peter, cruciform, with central tower, is a good example. Sudeley Castle (14th century) was given by Edward VI. to Sir Thomas Seymour, fourth husband of Catherine Parr; this queen died and was buried here.

WINCHELSEA, ANNE FINCH, COUNTESS OF (1661–1720), English author, daughter of Sir William Kingsmill of Sidmonton, near Southampton, was born in April 1661. In 1683, Anne was one of the maids of honour of Mary of Modena, duchess of York. She married in 1684 Col. Heneage Finch, who in 1712, on the death of his nephew Charles, became the 5th earl of Winchelsea. The countess of Winchelsea died in London on Aug. 5, 1720. Anne Finch's poems contain many copies of verse addressed to her friends and contemporaries. She was to some extent a follower of the "matchless Orinda" in the fervour of her friendships. During her lifetime she published her poem "The Spleen" in *Gildon's Miscellany* (1701) and a volume of *Poems* in 1713 which included a tragedy called *Aristomenes*.

Edmund Gosse wrote a notice of her poems for T. H. Ward's *English Poets* (vol. iii., 1880), and in 1884 came into possession of a ms. volume of her poems. A complete edition of her verse, *The Poems of Anne, Countess of Winchelsea,* was edited by Myra Reynolds (Chicago, 1903) with an exhaustive essay, and a new edition by John Middleton Murray (1928). *See* also E. Gosse, *Gossip in a Library* (1891), and E. Dowden, *Essays, Modern and Elizabethan,* Wordsworth's anthology for Lady Mary Lowther was first printed in 1905 (Oxford). Some of her work remains in ms. in the possession of Professor Dowden.

WINCHELSEA, ROBERT (d. 1313), archbishop of Canterbury, was probably born at Old Winchelsea. He studied in Paris, and was rector of the university at some period before 1267; he then taught at Oxford, where he became chancellor of the university in 1288. He held prebendal stalls in the cathedrals of Lincoln and St. Paul's, and was made archdeacon of Essex about 1283. In 1293, he succeeded Peckham as archbishop of Canterbury. His consecration, which took place at Aquila in Sept. 1294, was delayed owing to the vacancy in the papacy, but he found no difficulty in obtaining the temporalities of the see from King Edward I. Winchelsea is chiefly renowned as a strenuous upholder of the privileges of the clergy and the authority of the pope, and as a fearless opponent of Edward I. He assisted the barons in their struggle with Edward II. by a frequent use of spiritual weapons, and took part in the proceedings against the Templars. He died at Otford on May 11, 1313. Miracles were said to have been worked at his tomb in Canterbury cathedral, but extensive efforts to procure his canonization all proved unavailing.

See *Chronicles of the Reigns of Edward I. and Edward II.,* edited with introduction by W. Stubbs (London, 1882–83); S. Birchington, in the *Anglia sacra,* edited by H. Wharton (London, 1691); and W. Stubbs, *Constitutional History,* vol. ii. (Oxford, 1896).

WINCHELSEA, a village in the Rye parliamentary division of Sussex, England, 9 m. N.E. by E. from Hastings by a section of the S. railway. Pop. (1921) 152. It stands on an abrupt hill-spur rising above flat lowlands which form a southward continuation of Romney marsh. This was within historic times a great inlet of the English Channel, and Winchelsea was a famous seaport until the 15th century. Two gates, the one of the time of Edward I., the other erected early in the 15th century, overlook the marshes; a third stands at a considerable distance west of the town, its position pointing the contrast between the extent of the ancient town and that of the shrunken village of to-day. The town was laid out by Edward I. with regular streets intersecting at right angles; the form is preserved, and in a picturesque open space in the centre stands the church of St. Thomas à Becket. This comprises only the chancel and aisles of a building which, if entire, would rank as one of the finest parish churches in England. As it stands it is of the highest interest, showing remarkable Decorated work, with windows of beautiful and unusual design, and a magnificent series of canopied tombs.

Winchelsea as a Cinque Port was summoned to parliament in 1264–1265 and returned two members from 1366 till 1832, when it was disfranchised. Ship-building and fishing were carried on in the 13th and 14th centuries. In later years Winchelsea became a great resort for smugglers, and the vaults originally constructed for the Gascon wine trade were used for storing contraband goods.

WINCHENDON, a town of Worcester county, Massachusetts, U.S.A., near the northern boundary of the State; served by the Boston and Albany and the Boston and Maine railways. Pop. (1925) 6,173 (State census). It has a variety of manufacturing industries, and is known as "Toy Town" from the principal one. In 1764 the plantation called Ipswich-Canada was incorporated as the town of Winchendon.

WINCHESTER, a city and municipal and parliamentary borough of Hampshire, England, 66½ m. south-west by west from London by the S. railway; served also by the Southampton branch of the G.W. railway, with a separate station. Pop. (1921) 23,791. It occupies a hilly and picturesque site in and above the valley of the Itchen, lying principally on the left bank. The surrounding hills are chalk down, but the valley is well wooded.

The Cathedral.—The erection of Winchester into an episcopal see may be placed early in the second half of the 7th century, though it cannot be dated exactly. The West Saxon see was removed hither from Dorchester on the Thame, and the first bishop of Winchester was Hedda (d. 705). The modern diocese including nearly the whole of Hampshire, part of Surrey and very small portions of Wiltshire, Dorsetshire and Sussex, was found to be too unwieldy and in 1927 was divided into the dioceses of Winchester, Guildford and Portsmouth, the first including the whole of Hampshire together with the Channel Isles. St. Swithin (852–862), well known through the connection of his feast day (15th July) with the superstition that weather-conditions thereon determine those of the next forty days, is considered to have enlarged the cathedral, as are Aethelwold (963–984) and Alphege (984–1005). The history of the Saxon building, however, is very slight, and as usual, its place was taken by a Norman one, erected by Bishop Walkelin (1070–1098). The cathedral church of St. Swithin lies in the lower part of the city in a wide and beautiful walled close. It is not very conspicuous from a distance, a low central tower alone rising above the general level of the roof. It consists of a nave, transepts, choir and retrochoir, all with aisles, and a lady-chapel forms the eastward termination. The work of the exterior, of whatever date, is severely plain.

The cathedral, however, is the longest in England, and indeed exceeds any other church of its character in length, which is close upon 556 ft. Within, the effect of this feature is very fine. The magnificent Perpendicular nave is the work of Bishop Edington (1346–1366) and the famous William of Wykeham (1367–

1404), by whom only the skeleton of Walkelin's work was retained. The massive Norman work of the original building, however, remains comparatively intact in both transepts. The central tower is Norman, but later than Walkelin's structure. The choir is largely Edington's work, though the clerestory is later, and the eastern part of the cathedral shows construction of several dates. Here appears the fine Early English construction of Bishop de Lucy (1189–1204), in the retrochoir and the lady-chapel, though this was considerably altered later.

The square font of black marble is a fine example of Norman art, its sides sculptured with scenes from the life of St. Nicholas of Myra. The magnificent reredos behind the high altar must have been erected late in the 15th century. A second stone screen, placed at the interval of one bay behind the great reredos, served to enclose the small chapel in which stood the gold shrine, studded with jewels, the gift of King Edgar, which contained the body of St. Swithin. Under many of the arches of the nave and choir are a number of very elaborate chantry chapels, each containing the tomb of its founder. The most notable are the monuments of Bishops Edington, Wykeham, Waynflete, Cardinal Beaufort, Langton and Fox. The door of iron grilles, of beautiful design, now in the north nave aisle, is considered to be the oldest work of its character in England; its date is placed in the 11th or 12th century. The mortuary chests in the presbytery contain the bones of Saxon kings who were buried here. The remains were collected in this manner by Bishop Henry de Blois (1129–1171), and again after they had been scattered by the soldiers of Cromwell. The choir stalls furnish a magnificent example of Decorated woodwork, and much stained glass of the Decorated and Perpendicular periods remains in fragmentary form. The library contains a Vulgate of the 12th century, a finely ornamented ms. on vellum.

In 1905 serious signs of weakness were manifested in the fabric of the cathedral, and it was found that a large part of the foundation was insecure, being laid on piles, or tree-trunks set flat, in soft and watery soil. Extensive works of restoration, including the underpinning of the foundations with cement concrete (which necessitated the employment of divers), were carried out between 1906 and 1912.

The Minster and Hyde Abbey.—King Alfred founded a minster immediately north of the present site of the cathedral, and here he and other Saxon kings were buried. The house, known as Hyde Abbey, was removed (as was Alfred's body) to a point outside the walls considerably north of the cathedral, during the reign of Henry I. Here foundations may be traced, and a gateway remains. To the east of the cathedral are ruins of Wolvesey Castle, a foundation of Henry de Blois, where the bishops resided. On the southern outskirts of the city, in the pleasant water-meadows by the Itchen, is the Hospital of St. Cross. This also was founded by Henry de Blois, in 1136, whose wish was to provide board and lodging for 13 poor men and a daily dinner for 100 others. It was reformed by William of Wykeham, and enlarged and mostly rebuilt by Cardinal Beaufort (1405–1447). The buildings form three sides of a quadrangle, with a lawn and sun-dial in its midst; while the fourth side is partly open, and partly formed by the magnificent cruciform church. The earliest parts of this building are late or transitional Norman, but other parts are Early English or Decorated. The work throughout is very rich and massive. St. Cross is a unique example of a mediaeval almshouse, and its picturesqueness is enhanced by the curious costume of its inmates. It is still customary to provide a dole of bread and beer to all who desire it. A site of 100 acres in the St. Cross district has recently been developed as a garden city. King's Gate and West Gate alone remain of the gates in the walls which formerly surrounded the city. The West Gate is a fine structure of the 13th century. In the High Street stands the graceful Perpendicular city cross. The county hall embodies remains of the Norman castle, and in it is preserved the so-called King Arthur's round table. This is supposed to date actually from the time of King Stephen, but the painted designs upon it are of the Tudor period. New county council offices on Castle Hill were opened in 1911, and a chamber of commerce was founded in 1919.

Winchester is famous as an educational centre, and in addition to Winchester College there are several modern preparatory schools. The College of St. Mary, lying to the south of the cathedral close, is one of the greatest of English public schools. While a monastic school was in existence here from very early times, the college was originated in 1387 by William of Wykeham, whose famous scheme of education embraced this foundation and that of New College, Oxford. The buildings were completed about 1395. The quadrangles, with the fine chapel, tower, hall and cloister are noteworthy.

HISTORY

The history of the earliest Winchester (*Winton, Wynton*) is lost in legend; tradition ascribes its foundation to Ludor Rous Hudibras and dates it ninety-nine years before the first building of Rome; earthworks and relics show that the Itchen valley was occupied by Celts, and it is certain from its position at the centre of six Roman roads and from the Roman relics found there that the Caer Gwent (White City) of the Celts was, under the name of *Venta Belgarum,* an important Romano-British country town. Hardly any traces of this survive, but mosaic pavements, coins, etc., have been discovered on the south side of High Street. The name of Winchester is indissolubly linked with that of King Arthur and his knights, but its historical greatness begins when after the conquest of the present Hampshire by the Gewissas, it became the capital of Wessex.

When the kings of Wessex became kings of all England, Winchester became, in a sense, the capital of England, though it always had a formidable rival in London, which was more central in position and possessed greater commercial advantages. The parallel position of the two cities in Anglo-Saxon times is illustrated by the law of Edgar, ordaining that the standard of weights and measures for the whole kingdom should be "such as is observed at London and at Winchester." Under Alfred it became a centre of learning and education, to which distinguished strangers, such as St. Grimbald and Asser the Welshman, resorted. It was the seat of Canute's government; many of the kings, including Ecgberht, Alfred, Edward the Elder and Canute, were buried there.

Winchester was very prosperous in the years succeeding the Conquest, and its omission, together with London, from Domesday Book is probably an indication of its peculiar position and importance; its proximity to the New Forest commended it to the Norman kings, and Southampton, only 12 m. distant, was one of the chief ports for the continent. The Conqueror wore his crown in state at Winchester every Easter, as he wore it at Westminster at Whitsuntide and at Gloucester at Christmas. The royal treasure continued to be stored there as it had been in Anglo-Saxon times, and was there seized by William Rufus, who, after his father's death, "rode to Winchester and opened the Treasure House." In the reign of Stephen and again in the reign of Henry II. the Court of Exchequer was held at Winchester, and the charter of John promises that the exchequer and the mint shall ever remain in the city.

Under the Norman kings Winchester was of great commercial importance; it was one of the earliest seats of the woollen trade, which in its different branches was the chief industry of the town, although the evidence furnished by the *Liber Winton* (*temp.* Henry I. and Stephen) indicates also a varied industrial life.

The gild merchant of Winchester claims an Anglo-Saxon origin, but the first authentic reference to it is in one of the charters granted to the city by Henry II. The *Liber Winton* speaks of a "cnihts' gild," which certainly existed in the time of the Confessor. The prosperity of Winchester was increased by the St. Giles's Fair, originally granted by Rufus to Bishop Walkelin. It was held on St. Giles's Hill up to the 19th century, and in the middle ages was one of the chief commercial events of the year.

From the time of the Conqueror until their expulsion by Edward I., Winchester was the home of a large colony of Jews, whose quarter in the city is marked to the present day by Jewry Street; Winchester is called by Richard of Devizes "the Jerusalem of England" on account of its kind treatment of its Jews, and there alone no anti-Jewish riots broke out after the

coronation of Richard I. The corporation of Winchester claims to be one of the oldest in England, but the earliest existing charters are two given by Henry II., one merely granting to "my citizens of Winchester, who are of the gild merchant with their goods, freedom from toll, passage and custom," the other confirming to them all liberties and customs which they enjoyed in the time of Henry I.; further charters, amplified and confirmed by succeeding sovereigns, were granted by Richard I. and John. The governing charter till 1835 was that of 1587, incorporating the city under the title of the "Mayor, Bailiffs and Commonalty of the City of Winchester"; this is the first charter which mentions a mayor.

Winchester seems to have reached its zenith of prosperity at the beginning of the 12th century; the first check was given during the civil wars of Stephen's reign, when the city was burned. However, the last entry concerning it in the Anglo-Saxon Chronicle says that Henry Plantagenet, after the treaty of Wallingford, was received with "great worship" in Winchester and London, thus recognizing the equality of the two cities; but the latter was rising at Winchester's expense, and at the second coronation of Richard I. (1294) the citizens of Winchester had the significant mortification of seeing in their own city the citizens of London take their place as cupbearers to the king. The loss of Normandy further favoured the rise of London by depriving Winchester of the advantages it had enjoyed from its convenient position with regard to the continent.

During the Civil War the city suffered much for its loyalty to Charles I. and lost its ancient castle founded by William I. After the Restoration a scheme was started to restore trade by making the Itchen navigable to Southampton, but without success. Charles II., intending to make Winchester again a royal residence, began a palace there, which being unfinished at his death was used eventually as barracks. It was burnt down in 1894 and rebuilt in 1901. Northgate and Southgate were pulled down in 1781, Eastgate ten years later. Westgate still stands at the top of High Street. The guard room was formerly used as a debtors' prison, now as a museum. The two weekly markets, still held in the Corn Exchange of Wednesday and Saturday, were confirmed by Elizabeth's charter; the latter dates from a grant of Henry VI. abolishing the Sunday market, which had existed from early times. The same grant established three fairs—one on October 13 (the day of the translation of St. Edward, king and confessor), one on the Monday and Tuesday of the first week in Lent, and another on St. Swithin's day; the former two are still held. Winchester sent two members to parliament from 1295 to 1885, when the representation was reduced to one, and since 1918 it has been included in the county division which bears its name.

WINCHESTER, a city of Kentucky, U.S.A., the county seat of Clark county; 18 m. E. by S. of Lexington, on Federal highways 60 and 227, and served by the Chesapeake and Ohio and the Louisville and Nashville railways. Pop. 8,333 in 1920 (29% negroes); estimated locally at over 11,000 in 1928. Winchester is in the heart of the blue-grass region, where the breeding of horses and cattle and the raising of tobacco are the leading interests. The city was founded in 1792 and chartered in 1793.

WINCHESTER, a town of Middlesex county, Massachusetts, U.S.A., 8 m. N.W. of Boston, at the head of Upper Mystic lake; served by the Boston and Maine railroad. Pop. (1920) 10,485 (21% foreign-born white); 1928 local estimate 12,000. Within the town limits are two beautiful ponds, hills rising 320 ft. above sea-level, and parts of the Mystic Valley parkway and the Middlesex Fells Reservation. The streets are heavily shaded with fine old trees. In 1850 the town of Winchester was formed and named after Col. W. P. Winchester, of Watertown, who had left it a legacy for municipal works.

WINCHESTER, a city of northern Virginia, U.S.A., 65 m. N.W. of Washington; the county seat of Frederick county, but administratively independent. It is on Federal highways 11 and 50, and is served by the Baltimore and Ohio, the Pennsylvania and the Winchester and Western railways. Pop. 6,883 in 1920 (14% negroes); estimated locally at 10,000 in 1928. Winchester is pleasantly situated at the northern end of the fertile Shenandoah valley, 725 ft. above sea-level, and is surrounded by apple orchards. It has cold-storage warehouses with a capacity of 500,000 bbl. of apples, and large plants making cider, vinegar, apple sauce, apple butter and by-products. There are many buildings of historic interest in the city: Ft. Loudoun, built by George Washington in 1756; the houses used as headquarters by Stonewall Jackson and Sheridan; the ruins of the old Lutheran church, commenced in 1765; the stone building erected by the First Presbyterian church in 1790; and the county court house (1840), which was used both as a hospital and as a prison during the Civil War. The tomb of Lord Fairfax (d. 1781) is in the Christ Protestant Episcopal church. "Carter Hall," 10 m. S.E., is a typical ante-bellum Virginia home. Stonewall cemetery contains the graves of 3,000 Confederate soldiers, and in the national cemetery adjoining it are buried 4,500 Union soldiers.

A settlement was made in this vicinity as early as 1732, and in 1752 the town was established under its present name. It was incorporated in 1779, chartered as a city in 1852 and in 1916 adopted a council-manager form of government. In 1756, during the Seven Years' War, Washington made it his headquarters. During the Civil War it was the centre of important operations (*see* SHENANDOAH VALLEY CAMPAIGNS).

WINCHESTER FOOTBALL: *see* FOOTBALL, *The Winchester Game.*

WINCKELMANN, JOHANN JOACHIM (1717–1768), German archaeologist, was born at Stendal in Brandenburg on Dec. 9, 1717, the son of a poor shoemaker. He attended a gymnasium at Berlin and the school at Salzwedel, and in 1738 was induced to go as a student of theology to Halle. He then held various teaching posts. Winckelmann's study of ancient literature had inspired him with a desire to visit Rome. He became librarian to Cardinal Passionei in 1754, and embraced Catholicism. In 1755, before leaving for Rome, Winckelmann published his *Gedanken über die Nachahnung der griechischen Werke in Malerei und Bildhauerkunst* ("Thoughts on the Imitation of Greek Works in Painting and Sculpture"), followed by a pretended attack on the work, and a defence of its principles, nominally by an impartial critic. Augustus III., elector of Saxony and king of Poland, granted him a pension of 200 thalers to continue his studies in Rome.

He gradually acquired an unrivalled knowledge of ancient art. In 1760 appeared his *Description des pierres gravées du feu Baron de Stosch;* in 1762 his *Anmerkungen über die Baukunst der Alten* ("Observations on the Architecture of the Ancients"), including an account of the temples at Paestum. In 1758 and 1762 he visited Naples, and from his *Sendschreiben von den herculanischen Entdeckungen* (1762) and his *Nachricht von den neuesten herculanischen Entdeckungen* (1764) scholars obtained their first real information about the treasures excavated at Pompeii and Herculaneum.

His masterpiece, the *Geschichte der Kunst des Alterthums* ("History of Ancient Art"), issued in 1764, was soon recognized as a permanent contribution to European literature. In this work Winckelmann sets forth both the history of Greek art and the principles on which it seemed to him to be based. Many of his conclusions based on the inadequate evidence of Roman copies have been modified or reversed by subsequent research, but the fine enthusiasm of the work, its strong and yet graceful style, and its descriptions of works of art give it enduring value. It was read with intense interest by Lessing, who had found in Winckelmann's earliest works the starting-point for his *Laocoon.*

In 1768 Winckelmann went to Vienna, where he was received with honour by Maria Theresa. At Trieste on his way back he was murdered in an hotel by a man named Arcangeli to whom he had shown some coins presented by Maria Theresa (June 8, 1768). He was buried in the churchyard of the cathedral of St. Giusto at Trieste.

An edition of his works was begun by Fernow in 1808 and completed by Meyer and Schulze (1808–20). There are admirable studies of his character and work in Goethe's *Winckelmann und sein Jahrhundert* (1805), to which contributions were made by Meyer and Wolf, and in Walter Pater's *Renaissance* (1902). The best biography of Winckelmann is by Justi, *Winckelmann und sein Zeitgenossen*

(2nd ed., 3 vols., Leipzig, 1898). A collection of letters, *Briefe an seine Züricher Freunde,* was published by Blümner (Freiburg, 1882).

WIND, a current of air coming from any particular direction or with any degree of velocity. For the general account of winds, their causes, etc., *see* METEOROLOGY. Winds may be classified according to the velocity with which they blow, varying from a light breeze (*q.v.*) to a gale, storm or hurricane (*q.v.*); *i.e.*, according to their place on the BEAUFORT SCALE (*q.v.*); for the measurement of their velocity *see* ANEMOMETER.

WINDAU, now Ventspils (*q.v.*).

WINDBER, a borough of Somerset county, Pennsylvania, U.S.A., 10 m. S.E. of Johnstown; served by the Pennsylvania railroad. Pop. (1920) 9,462 (29% foreign-born white); 1928 local estimate 12,000. It is the centre of a large coal-mining, farming and lumbering region, and its manufactures include fire-brick and various other commodities. It was incorporated in 1900.

WIND BRACES, in architecture, diagonal braces to tie the rafters of a roof together and prevent "racking." In many mediaeval roofs they are arched, and run from the principal rafters to catch the purlins. In modern steel construction, wind bracing is necessary in the wall and floor framing of high buildings to withstand the diagonal stresses set up by the wind pressure on a side wall; the wind braces take the form either of diagonal tension rods, of diagonal angle, channel or I-beam bracing at the corners, or of enlarged web or gusset plates at the intersections of framing members.

WINDERMERE, the largest lake in England, in the south-eastern part of the Lake District (*q.v.*). In the county of Westmorland, the boundary with Lancashire runs along the western shore, round the foot and northward along about one-third of the eastern shore. It is 10½ m. long and never reaches 1 m. in width: area 5.69 sq.m. The shores are generally steep, beautifully wooded and fretted with numerous little sheltered bays. The hills immediately surrounding the lake rarely reach 1,000 ft., but the distant views of the mountains to the north and west contrast finely with the sylvan beauty of the lake itself. Immediately opposite Bowness is a group of islands (Belle Isle, Thompson's Holme, the Lilies and others) which divide the lake into two basins. The greatest depth sounded in the northern basin is 219 ft., and in the southern 134. The lake receives the Rothay and Brathay streams at the head; Trout Beck also flows into the north basin, and Cunsey Beck from Esthwaite into the south. The lake is drained by the Leven. Steamers ply regularly on Windermere, the chief stations being Lakeside, on the L.M.S. railway (south) Ferry (west), Bowness (east) and Waterhead, for Ambleside (north). The lake contains perch, pike, trout and char; there are several large hotels at Bowness and elsewhere on its shores.

The town of WINDERMERE, above the eastern shore adjacent to Bowness (*q.v.*), is an urban district and the terminus of a branch of the L.M.S. railway. Pop. (1921) 6,495.

WINDHAM, WILLIAM (1750–1810), English politician, son of Col. William Windham (1717–1761), was born in Golden square, London, on May 3, 1750. His first political office was as chief secretary for Ireland in the coalition ministry of Fox and North, for a few short months in 1783. Though he was opposed to parliamentary reform, to which most of the Whigs were committed, he remained in alliance with the party until the outbreak of the French Revolution, when, with several of his friends, he joined Pitt. In 1794 he became secretary at war, with a seat in the cabinet, and he held office until 1801. He declined a place in Pitt's new cabinet in 1804, but was again at the War Office in the brief ministry (1806) of "All the Talents." He died on June 4, 1810. Windham was a dignified and commanding figure in parliament, and a keen advocate of army reform.

See his *Speeches* (3 vols., 1806), and his *Diary* (edit. Mrs. Henry Baring, 1866).

WINDING ENGINE: *see* COAL AND COAL MINING.

WIND INSTRUMENTS, a numerous and important section of the orchestra, classified according to the acoustic properties of the instruments and to certain important structural features. The first great natural subdivision is that of (A) mouth blown, and (B) mechanically blown, instruments.

Section A.—This falls into the classes of (1) wood wind; (2) brass wind, with their numerous subdivisions.

1. *Wood Wind.*—(*a*) Pipes without embouchure or mouthpiece, such as the ancient Egyptian nay (*q.v.*), a long flute with narrow bore held obliquely, and the *syrinx* or pan-pipes (*q.v.*), both of which are blown by directing the breath not *into* the pipe but *across* the open end. (*b*) Pipes with embouchure but no mouthpiece, such as the transverse flute, piccolo and fife. (*See* those instruments, and also MOUTHPIECE.) (*c*) Pipes with whistle mouthpieces, an ancient contrivance, extensively used by primitive races of all ages, which finds application at the present day in the flageolet, the whistle and in organ pipes known as the flue-work, earlier examples having been the recorders, beak or fipple-flutes, *flûtes à bec, flûtes douces,* etc. (*d*) Reed instruments, by which are to be understood, not reed pipes but instruments with reed mouthpieces, which subdivide again into two families owing to the very different acoustic conditions produced by the combination of a reed mouthpiece with (1) a cylindrical pipe and (2) a conical pipe. These combinations influence not only the timbre, but principally the harmonics obtained by over-blowing, and used to supplement the fundamental scale given out as the lateral holes are uncovered one by one. (*d*1) comprises pipes with cylindrical bore with either single or double-reed mouthpiece, such as the clarinet (*q.v.*), the obsolete batyphone (*q.v.*) and the family of cromornes (*q.v.*). To these we may add the aulos (*q.v.*) and tibia (*q.v.*) of ancient Greece and Rome, which at different times had single and double-reed mouthpieces. (*d*2) Pipes with conical bore and either single or double-reed mouthpiece. This class comprises the important members of the oboe family (with double reed) derived from the Schalmey and Pommer of the middle ages. (*See* OBOE and REED INSTRUMENTS.) The modern family of saxophones (*q.v.*) with single-reed mouthpiece may be classed with the wood wind, although actually made of brass for durability. The same may be said of the sarrusophones (*q.v.*), a family of brass oboes with double reed. To these we may add the Cheng (*q.v.*) or Chinese organ. (*e*) Wooden tubes of conical bore having lateral holes and sometimes from one to three keys played by means of a cup or funnel mouthpiece, such as the obsolete cornet (*q.v.*) or Zinke, which enjoyed such widespread popularity during the 16th and 17th centuries, and their bass the serpent. The bagpipe and its drones and chaunter are mostly indirectly mouthblown.

2. *The Brass Wind* consists of the following classes: (*a*) Tubes of fixed length, such as the natural trumpet and French horn, all mediaeval horns and trumpets, including the busine, the tuba, the oliphant, the hunting horn and the bugle, the classical buccina, cornu, lituus and tuba (*qq.v.*). The compass of all these was restricted to the few notes of the harmonic series obtained by over-blowing. (*b*) Tubes of which the length is varied by a slide, such as the sackbut family, the slide trombone and slide trumpet (*qq.v.*) (*c*) Tubes of which the length is varied by lateral holes and keys. To this class belong the keyed bugle and its bass the ophicleide (*qq.v.*) The saxophones and sarrusophones might also be classed with these (*see* above, 1, *d*2). (*d*) Tubes of which the length is varied by valves or pistons, such as the tubas, cornets, valve trombone, valve trumpet, valve horn and so on, all of which are dealt with under their own names.

Section B: Mechanically Blown Instruments.—This section consists mainly of instruments having the air supply fed by means of bellows; it comprises the two classes (1) with keyboard, (2) without keyboard.

1. This includes all kinds of organs and to this class also belong the accordion and concertina and the numerous instruments of the harmonium type which have free instead of beating reeds.

2. This includes the bagpipes known as musettes and the Union or Irish and the Border bagpipes having a wind supply fed by bellows instead of by the insufflation pipe proper to the bagpipe.

WINDLASS, a large cylinder, conventionally termed the wheel, turning a smaller cylinder or barrel termed the axle, the difference in size giving a gain of power. A rope, partly coiled around the "axle" is attached to the load. In some cases the

wheel is turned by means of a rope coiled around it, *e.g.*, light hand cranes, but in many hoists and cranes the function of the wheel is taken by a winch handle, and in other cases by a toothed wheel driven from a pinion, hand or motor driven. The Chinese windlass gives a great gain of power by the use of axles of two diameters. A ship windlass is a more complicated apparatus, hand, steam or electrically driven, with chain wheels by means of which the anchor chain is hoisted and let out. Powerful brakes, and often coned warping drums for whipping purposes, are fitted.

WINDMILLS AND WIND POWER. A windmill is any machine for directing the wind's energy to perform work. Specifically it is the familiar type persisting through centuries of selection, in which the wind's action on the sails produces a torque and from which, by gearing or otherwise, power is transmitted to perform work.

History of Windmills.—Early windmill history is obscure, and although records state that they existed prior to the 12th century, authentic records indicate that they first became common in Germany, the Netherlands and surrounding countries. Windmills have occupied a prominent part in the efforts of those interested in the mechanical arts, and since the 12th century many ingenious designs were perfected. Detailed information is available on the later mills in records of Smeaton's tests of 1755 and Coulomb's of 1821. During the first half of the 19th century the old types were still prominent, but because of their high cost and uselessness during calm weather, they gave way increasingly to the steam engine.

In the latter half of the 19th century conditions in rural America were suitable for the use of windmills for the pumping of water in moderate quantities and Daniel Halladay brought out the first American type of windmill about 1854. Halladay's mill had a sectional wheel with wood sails, and its lines followed somewhat the European mill (*see* below). Its success promoted rapid windmill development, and solid wheel mills with wood sails soon followed, being the forerunners of the present most common type of steel sail windmill first brought out by Perry in 1883.

Windmills are generally placed in two classes: (1) horizontal, having the axis of sail revolution perpendicular to the wind direction and (2) vertical, having the axis parallel with the wind direction. Although many ingenious horizontal windmills have been made, they are impracticable, as not more than a quarter of sail surface is presented to the wind at any time. Efficient use of sail surface is essential to economy in first cost and compels the adoption of the vertical type, because the wind acts on all of its sail surface continuously.

Early Windmill Construction was of the vertical type and of two kinds; the German or post mill, in which the building on which the windmill was erected revolved on a central post to shift

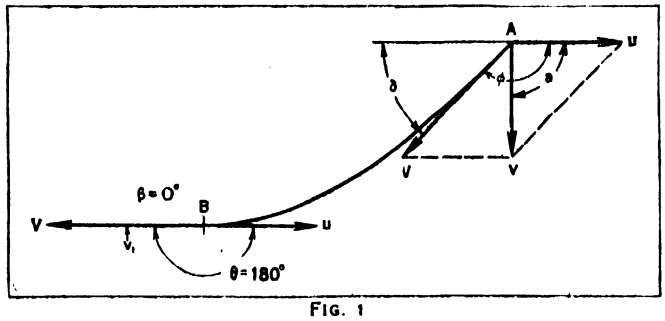

FIG. 1

the mill according to the wind direction; and the Dutch mill, in which the building remained stationary, while the entire top or roof revolved and the mill-shaft with its bearings, being a part of this structure, revolved with it. The design of the wind-wheel and sails was similar in both mills. The axle was usually inclined 15° because the dip of the general wind direction was considered to be that amount, and was so placed that the sail-ends came quite close to the ground in revolving.

The sails consisted of canvas stretched over cross slats on the four, five or six radial arms. The sail (of a 60 ft. wheel), beginning about 4½ ft. from the axle and extending to the arm extremity, might be 4½ ft. wide throughout or wider at the outer end. The sail was plane, concave or warped, the latter being the most common and efficient. According to Smeaton the angle of weather for plane sails varied from 12° to 18° and for warped sails, from 18° at inner end to 7° at outer end. The power was usually transmitted through a large toothed wheel on the inclined axle meshing with a pinion on a vertical shaft extending down in the mill building. The first mills were brought and kept in the wind by hand; later a small wheel back of, and with its plane perpendicular to the large wheel, kept it in the wind through a rack and pinion operated when the wind direction changed so that it could act on the small wheel's surface.

Regulation was accomplished by increasing or decreasing canvas on the sails, necessitating the mill being stopped, usually by applying a brake on the main gear. Later this was done automatically, so that the mills governed as accurately as other prime movers. American mills have tended toward small sizes, with many narrow sails set radially quite close together. This type has been very successful and where conditions are similar to those in the United States, it has been made in many different designs and marketed throughout the world.

Windmills as Prime Movers have been developed by American designers, but with the appearance of small gasolene engines, power windmills have practically disappeared. Windmills are used in the United States almost entirely for pumping water for rural use. The mechanism for transmitting power to the vertical shaft of the power mill, or to the pump-rod of the pumping mill, embodies any common form of transmission device.

Construction of Pumping Windmill.—Aside from the tower which supports it, the American pumping windmill usually has seven units; windwheel, including sails, girts, arms and spider; pivot, including main-shaft, gears and reciprocating mechanism, now commonly made self-oiling; brake, including operating levers; rudder vane, including bar and hinge; governor spring or weight and attachments; pull-out, including swivel, wire and lever or reel; and pump-pole with its swivel.

The main types of modern windmills are the solid and sectional, direct-stroke and back-geared, all made in wood or steel, with the latter fast supplanting the former. Inherent construction makes the wood sail mill direct-stroke, with either sectional or solid wheel, and the steel sail mill back-geared, with solid wheel only. In the sectional wheel, each section is hinged on a chordal axis so that, in governing, centrifugal force swings the section toward a position parallel with the wheel axis. In the solid wheel mill, governing is accomplished by providing a side vane or setting the wheel off-centre with respect to the pivot or tower centre, so that the wind pressure tends to turn the mill on its vertical axis, thus reducing the effective area of the wheel and therefore its speed as the wind increases. In both mills, the governing force is opposed by a spring or weight and levers, the entire device being simple and reliable, and the governing not within close limits, as this is unnecessary.

Recent years have seen considerable progress in development of windmills having aeroplane type sails, such mills of small size also being used in aeroplanes to drive auxiliary apparatus. Practical electric generating units are manufactured on a limited scale, the windwheel being similar to an aeroplane propeller and its drive being through gearing or direct connected to the generator. The low starting torque of the propeller presents a real difficulty in applying this idea economically to the pumping windmill.

Windmills of the aeroplane propeller type, in large size, are used to some extent, but have not found a ready market, indicating they are not economically practicable. Certain principles applying to other prime movers are not applicable to windmills. In a line of windmills, all lineal dimensions are in proportion to the wheel diameter D. The area of the wheel and the power of the mill increase as D^2, but the material, weight and cost increase as D^3 increases. This has the abnormal effect of making the cost of power produced by a large mill greater than for a smaller mill; for example, 100 10′ mills produce as much power as one 100′ mill, but would cost only one-tenth as much. This

explains why the common windmill in large sizes is not economically feasible. American windmills were originally made 25 ft. and larger, but the common steel windmill sizes range from 6 to 16 ft., with more of the 8 ft. size sold than all others combined.

(H. C. Sc.)

GENERATION OF ELECTRICITY

In Great Britain.—The development of the windmill for the generation of electricity is mainly—so far as Great Britain is concerned—a post-War movement. During the years 1924–25 the Institute of Agricultural Engineering, University of Oxford, carried out an investigation into the performance of eight sets, ranging in rated output from 0·300 kw. to 10·0 kw. The windwheels were from 8 feet to 29·5 feet in diameter and the structures varied in height from 10 feet to 60 feet.

Wind Power.—In windmill work the "fuel" used is free and unlimited and there arises the possibility of a large "inefficient" wheel being preferable to a smaller "efficient" one, which is more expensive to manufacture.

The cost of the energy obtained is mainly due to capital charges and depreciation; maintenance and repair are relatively small items. The plants tested by the Institute of Agricultural Engineering supplied energy at costs varying from 12·7 pence per kw.h. for a set giving an annual output of 316 kw.h. to 4·1 pence per kw.h. for a set giving an annual output of 7,640 kw.h.

It was established that continuity of supply is assured in average cases by installing a storage battery capable of supplying the heaviest winter demand for three successive days. The battery fulfils a further important function in acting as a "flywheel" between the dynamo and the load. The wind fluctuates in strength from second to second, with corresponding fluctuations in the power supplied by the dynamo: the battery enables the demand to be supplied steadily without momentary reference to the state of the wind.

Design.—The development of windmill generating plants has proceeded along two lines; (*a*) the adaptation of the slow-speed windwheel—typified by the American multibladed wheel—to drive a dynamo, (*b*) the design of a new high-speed type of wheel to suit the particular requirements. The medium speed type—exemplified by the familiar sweep-sail Dutch mill—has not been applied to any extent to generating electricity.

By the term "speed" in connection with a wind-wheel is meant the circumferential speed of the blade tips, and it is usual in windwheel technique to compare this speed with the wind-speed at which it is produced. If the wind-speed is denoted by V and the circumferential speed of the blade tips at this wind-speed is denoted by U, the ratio $\frac{U}{V}$ expresses the speed characteristic of the wheel. Slow-speed wheels—multibladed with concave sheet-metal blades—have a value for $\frac{U}{V}$ varying from 1·0 to 1·5. Medium-speed wheels vary from 1·5 to 3·0: the sweep-sail mills are in this class. High-speed wheels run at values for $\frac{U}{V}$ varying from 3·0 to 6·0: this class contains wheels with the modern stream-lined blades, varying from two to five in number and covered with sheet metal or fabric.

Efficiency.—A useful formula for determining the power exerted by the wind on a windwheel is

$$H.P. = 0.0000022 6AV^3$$

where A is the whole area, in square feet, enclosed by the circumference described by the windwheel and V is the wind-speed in feet per second.

The efficiency of a windwheel is the use which it makes of this power, and the figure by which efficiency is expressed shows what proportion of the energy of the wind acting on the windwheel is transformed into mechanical energy available at the hub of the wheel. It is not possible to use up all the energy in the wind, since some must be left to carry on the flow of air: this consideration results in the theoretical maximum possible efficiency being 0·59. The practical efficiencies are much below this.

M. Sabinin finds the best efficiencies and the speed at which they are obtained to be:

	Best Efficiency	at U/V
Slow-speed wheel	0·33	1·17
Medium-speed wheel	0·22	2·00
4-bladed high-speed wheel	0·42	3·10
2-bladed high-speed wheel	0·36	4·30

Dr. Betz has a design for a high-speed wheel to run with reasonable efficiency at $\frac{U}{V} = 6$.

The use of high-speed wheels for driving generators is increasing in favour for four reasons:—

1. They are more efficient.
2. The higher speed of the wheel means that less gearing is required to drive the dynamo at the proper speed.
3. The surface area of the blades is small, thus reducing the risk of damage in gales.
4. They are more easily erected.

Observation of wind conditions over several years show that, when fixing the site for a windmill plant the greatest care should be taken to ensure freedom from interference from trees, etc., on the sides from which the winds mainly come. The wheel should be as high as possible to obtain the utmost use of the winds. At the coast and in exposed hilly districts there should be no hesitation in adopting windpower to supply electricity. Even in ordinary inland parts there are very few districts where a suitable site cannot be found. Thus, for isolated districts wind power may be adopted for generating purposes with every assurance of reliability and economy; for communal groupings and for medium power work there are larger sets providing the same service.

(C. A. C. B.)

WINDOW, an opening in the wall of a building, for the admission of light and air. Windows are obviously a very ancient invention, probably almost coincident with the development of fixed and enclosed houses, particularly in those parts of the world in which courtyards were of little importance. Representations of windows occur alike in early wall paintings in Egypt, reliefs from Assyria, and terra-cotta plaques from Crete. The Egyptian examples show openings in house walls covered with mattings, like the doors, as in the V. Dynasty tomb of Ti. Well known examples of Egyptian windows also exist in the hypostyle hall of the great temple at Karnak, built by Seti I. and Rameses II., and in the so-called pavilion at Medinet Abu, near by. In the hypostyle hall the central aisles have much higher columns than those at the sides, and the space between is filled by clerestorey windows consisting of huge granite slabs pierced with two tiers of narrow, vertical openings. In the pavilion at Medinet Abu there are several windows consisting of simple rectangular openings with a small, decorative frame. These were probably originally closed by hangings of matting or cloth. Assyrian windows are almost always wider than they are high, and subdivided by little colonnettes. Many such openings are shown in the palace reliefs of the 9th and 8th centuries B.C. They are generally high in the wall. The Cretan plaques show many house fronts; in these there are indications of several tiers of windows, as though the houses were two or three storeys high, and in the windows themselves representations of frames, dividing the large opening into four smaller ones by means of a central mullion and a horizontal transom bar.

Greek and Roman.—The devotion of the Greeks to the house built around a court led to an almost total disappearance of windows, and such remains as those of Delos, although they are principally of Alexandrian and Hellenistic date, show scanty signs of windows, each room being lighted only by a door to the central, colonnaded court. In temples, also, windows are usually lacking, and the interior was lighted only by what light entered through the door or percolated dimly through the marble tiles of the roof. In exceptional cases, however, windows of very marked architectural character occurred. In the Erechtheum (*q.v.*), for instance, although the windows in the western wall date from a Roman reconstruction, the great eastern door was, from the beginning, flanked by window openings, with an architrave band around and a cornice above, and the existence of such highly developed window forms in the 5th century B.C. would seem to indicate that similar forms had long been well known.

In Roman imperial times the glazed window first definitely appears, and fragments of glass in a bronze frame have been found in Pompeii, as well as many other fragments of glass in the remains of Roman villas in England. Moreover, it is obvious that the great windows in the Roman bath halls must have been enclosed in some way, in order to retain the heat. The general hypothesis is that these great segmental-headed clerestorey openings, whose shape is perfectly preserved to the present day in the tepidarium of the baths of Diocletian at Rome, now the church of S. Maria degli Angeli, were filled, originally, with frames of bronze which subdivided the whole into small areas, each of which held a pane of glass. There is much debate as to how common glass was during the early empire, and whether the *specularis* which Pliny refers to, in his letter (no. 217), describing his villa at Laurentum, were glazed windows or not; they, without doubt, refer to transparent or translucent windows. In addition to glass, the Romans are known to have used thin sheets of translucent marble, panes of mica, shells and horn.

Byzantine church windows were glazed from an early period. Thus it is known that from the beginning, the windows of S. Sophia at Constantinople (begun 532) were filled with pierced, marble frames enclosing panes of glass, and it is possible that some of the glass still existing may be the original glazing.

The Mohammedan builders copied this Byzantine technique of inserted, small pieces of glass, in a masonry frame, and by substituting cement for marble, obtained great freedom and richness in pattern design, so that with the use of different colours of glass in the small openings, brilliant effects were produced.

Mediaeval.—It was probably also during the Byzantine period that windows covered by a complete arch superseded the segmental and square heads common in Roman work, and it is the arched window that became the governing form throughout mediaeval Europe, at least for masonry buildings. The history of the window in the domestic architecture of the early middle ages is as difficult to trace as that of ecclesiastical architecture is easy. From existing reliefs, representing early Romanesque houses, it appears that semicircular, arched windows were the rule in masonry town houses, and square-headed windows in timber-built country work. From an early period, however, the tendency appeared to use square-headed openings in masonry houses. Thus in the Hôtel de Ville at S. Antonin, France (12th century), the main hall is lit by 12 little square-headed openings in groups of four, forming practically an open loggia. There are indications that these openings were closed by shutters. The rooms above, however, have semicircular windows in pairs. With the gradual introduction of the glazed sash in secular work, which apparently began during the 12th century, the tendency toward the use of rectangular openings was much increased, due to the ease with which sash could be framed in them. During the late 12th century, transitional forms are found, especially in south France, in which arch-headed openings are divided by a heavy frame member at the spring, so that at least the lower part of the window could have a rectangular sash, as in the 12th century house at Monpazier, illustrated by Viollet-le-Duc, *Dictionnaire raisonné*, art. "Maison." The 12th century Jew's house in Lincoln, England, preserves traces of original arch-headed windows, which were later altered to square heads. From the middle of the 13th century on, the square head becomes almost universal, even in masonry buildings, although traces of the arch tradition remain in the arch forms often carved upon the stone lintels.

The desire for light and air increased continuously with the growing cheapness of glass, but the necessity for small sashes remained; the inevitable result was the development of the mullioned and transomed window, generally rectangular in shape, in which the entire opening is subdivided into convenient sizes by vertical bars known as mullions and horizontal bars known as transom bars. The climax of the development appears in France in such 15th century work as the Cluny museum at Paris, and the house of Jacque Coeur at Bourges; in England, in countless Tudor and Jacobean houses. In some of these, as in Sutton place, Surrey (1525), the small, rectangular sections made by the mullions and transoms are decorated with cusped arches. The glazing of these mediaeval, secular windows was probably originally done by assembling many small pieces of glass in a wooden framework or sash. There was a great use of roundels. Later, leading was introduced, although the whole leaded sash was set in a wooden frame. The leading was usually in panes, either rectangular, with the long dimension vertical, or in diamonds. Toward the end of the period, especially in England, metal sashes began to be introduced.

The development of ecclesiastical windows was quite different, for two reasons: first, the necessity for large size, which rendered the arch head inevitable; and second, the development of stained glass (*q.v.*). The combination of these two elements, together with the general use of stone, vaulted forms, in church architecture, led to, first, the grouping of several small windows in one composition, as in much early English Gothic work, and later, during the early 13th century, the evolution of tracery (*q.v.*). The leaded glass in these windows was inserted in a groove cut in the inside edge of the jamb and held in place by iron bars or an iron framework. A characteristic feature of almost all mediaeval windows is the splaying of the jambs on the interior, so that the opening on the inside face of the wall is much larger than that on the outside. In this manner the illumination was increased and the large openings inside offered great opportunities for decorative richness.

Renaissance.—Early Renaissance palace windows in Italy show many attempts at compromise between the arched and mullioned windows of Gothic tradition and the classic feeling that the rectangular opening was more dignified. Thus most of the 15th century Florentine palaces had twin, arched windows under a single enclosing arch; in many cases the opening itself was square-topped and the arches above mere panels. During the high Renaissance period, the rectangular window was the most popular form. It was frequently decorated with an architrave, and a cornice and pediment. Pilasters and columns were often added at the sides. During the Baroque period these decorative window enclosures were often elaborately scrolled and ornamented with fantastic cartouches, consoles, masks and human figures. Arched windows appeared spasmodically throughout the Renaissance, usually in churches or enclosed loggias. The general system of glazing in Renaissance Italy was the use of wooden-hinged frames, subdivided by small wooden bars known as *muntins;* the tendency was continuous toward the use of larger and larger panes of glass.

In the countries north of Italy, the persistence of mediaeval window forms into the Renaissance was marked. In France, for instance, debased Flamboyant tracery forms occur in churches well into the reign of Henry II. (1547–59), as in the church of Notre Dame at Grand Andely, and mullioned and transomed windows were a distinctive feature of the chateaux of the time of Francis I. Similarly in England, rectangular, mullioned windows, with hinged sashes and leaded glass, and occasionally decorated with cusped arches, are found, particularly in the collegiate buildings at Oxford and Cambridge, well into the 17th century.

The later Renaissance in France produced and developed the type of large casement window that has remained the accepted form on the continent of Europe ever since—popularly known as

the French window. In this type the opening is high and comparatively narrow, frequently extending down to the floor and is glazed with two large, hinged, wooden sashes, arranged to swing in, each subdivided into three or more lights of comparatively large size. An iron railing or stone balustrade is built on the outside for safety. It is largely the use of such windows that has given the stimulus to the extensive use of balconies in modern continental apartment houses. In England the late Renaissance development was determined by the common use of the type of window known as "double hung," which during the late 17th and 18th centuries almost superseded the swinging casement. In this the window is divided into two sashes, horizontally, the lower one on a plane slightly inside the upper one. By lowering the upper sash and raising the lower, any desired amount of ventilation up to half the area of the entire opening can be produced. In the cruder kinds of double hung window, the sashes are supported in position by pegs or spring cams, or elbows. The more developed type, now universal, has the sash hung on ropes or chains, which pass over pulleys and are connected at the other end to counter weights concealed in the window frame or box. In England the custom was to use smaller size panes than on the Continent, and this custom coloured all window design of England and America for 150 years; recent times have seen a new popularity of this use of small panes.

Modern.—Modern mechanical genius has developed many ways of using metals in window design. Not only are metal windows used largely in fire-proof buildings, but due to the economies of large scale manufacture, are more and more coming into use in smaller houses. The most common type of metal window for residence buildings is the steel casement in which all of the members are of rolled steel sections put together in stock units. Rolled steel is also used for certain types of double hung windows, especially in commercial buildings, and somewhat similar bronze frames and sashes are much used in monumental windows, such as those in banks, public buildings, etc. All sorts of operating devices have also been developed for controlling sashes far from the floor. The steel sash and the operating device have rendered possible the enormous increase in window area in industrial buildings, so that the typical modern factory has not only walls almost entirely of glass but frequently, as well, roofs arranged with a saw-tooth profile that permits ranges of almost vertical windows on the steeper slope.

Oriental.—A great difference in window design between the Orient and the west is due to the almost total lack of window glass in oriental countries. In addition to the mosque windows which followed Byzantine prototypes, the Mohammedan builders of Egypt and Syria developed an extremely rich type of domestic window which was usually unglazed. This consisted of a projecting, bracketted, framework of wood with its sides entirely filled by intricate grille-work formed of carved, turned, wooden spindles. In China and Japan windows are usually covered with paper, cloth or shell. All of these require a large amount of subdivision of the window area; shell, because of the small size of the elements, the other materials because of their fragility.

Japanese windows are usually arranged to slide horizontally. Ordinarily the whole opening is of great width in relation to its height, and is subdivided into a number of small sashes, each sliding in a different plane, and all arranged so as to slide back into a pocket or case, bracketted out from the outside face of the wall. The patterns of Japanese window subdivisions are more limited than those of China and are universally based on the subtle relationships of rectangular shapes, these rectangles always having their long dimensions horizontal. (*See* BYZANTINE AND ROMANESQUE ARCHITECTURE; GLASS; GOTHIC ARCHITECTURE; TRACERY.) (T. F. H.)

WINDOW TAX, a tax first levied in England in the year 1697 for the purpose of defraying the expenses and making up the deficiency arising from clipped and defaced coin in the recoinage of silver during the reign of William III. It was an assessed tax on the rental value of the house, levied according to the number of windows and openings on houses having more than six windows and worth more than £5 per annum.

The revenue derived from the tax in the first year of its levy amounted to £1,200,000. The tax was increased no fewer than six times between 1747 and 1808, but was reduced in 1823. There was a strong agitation in favour of the abolition of the tax during the winter of 1850–51, and it was accordingly repealed on July 24, 1851, and a tax on inhabited houses substituted.

WINDPIPE, the trachea, the air tube which leads from the larynx to the bronchi and lungs (*see* RESPIRATORY SYSTEM).

WINDSOR, a city and port of entry of Essex county, Ontario, Canada, on the left bank of the Detroit river, opposite the city of Detroit. Pop. (1921) 38,591. It is on the Canadian National, Canadian Pacific, Pere Marquette and Michigan Central railways, which connect at this point with the railways of the United States by means of large and powerful car-ferries. It is the centre of an important agricultural and fruit-growing district, in which tobacco is also produced. Salt works, flour mills, canning factories, and the manufacture of type-setting machines are the main industries.

WINDSOR (properly NEW WINDSOR), a municipal borough of Berkshire, England, and a parliamentary borough extending into Buckinghamshire. Pop. (1921) 13,537. The town, which is famous for its royal castle, lies on the west (right) bank of the Thames, 21¼ m. W. of London by the G.W. railway, which serves it with a branch line from Slough. It is also the terminus of a branch of the S. railway. Here the Thames makes a loop which partially encircles the Eton playing fields.

Windsor Castle.—The castle lies at the north-eastern edge of the town, on a slight but commanding eminence made by the projection of the underlying chalk through the clays and gravels which cover the rest of the district, while the massive round tower in the centre, on its artificial mound, is conspicuous from far over the flat land to the east, north and west. The site of the castle is an irregular parallelogram measuring about 630 yd. by 180. On the west the walls enclosing the "lower ward," with the Clewer, Garter, Salisbury and Henry III. towers, overlook Thames Street and High Street, from which the "hundred steps" give access to the ward on the north, and the Henry VIII. gateway, opening from Castle Hill, on the south. This ward contains St. George's Chapel in the centre, with the Albert Memorial Chapel on the east and the Horseshoe Cloisters on the west. To the north are the deanery and the canon's residences and to the south the guard-room and the houses of the military knights, or pensioners. The round tower occupies the "middle ward"; on its flag-turret the Union Jack or the Royal Standard is hoisted according as the sovereign is absent or present. The buildings in the "upper ward," east of this, form three sides of a square; the state apartments on the north, the private apartments on the east and the visitors' apartments on the south. Along the north side of the castle extends the north terrace, commanding, from its position above a steep slope, splendid views across the river to Eton on the Buckinghamshire side, and far over the valley. The east terrace, continuing the north, overlooks the gardens in front of the private apartments, and the south terrace continues farther, as far as the George IV. gateway. The Home Park lies adjacent to the castle on the south, east and north. The Great Park extends south of Windsor, where the land, rising gently, is magnificently timbered with the remnant of the old royal forest.

As early as the time of the Heptarchy a stronghold of some importance existed at Windsor, the great mound, which is moated, circular and about 125 ft. in diameter, being a remnant of this period. William the Conqueror was attracted by the forest as a hunting preserve, and obtained the land by exchange from Westminster Abbey, to which Edward the Confessor had given it. Thereafter the castle became what it remains, the chief residence of the English sovereigns. The Conqueror replaced the primitive wooden enclosure by a stone circuit-wall, and the first complete round tower was built by Henry III. about 1272, but Edward III. wholly reconstructed it on a more massive scale, about 1344, to form a meeting-place for his newly established order of Knights of the Garter. He selected this spot because, according to a legend quoted by the chronicler Froissart, it was on the summit of the mound that King Arthur used to sit surrounded by his Knights of the Round Table. The bulk of the existing round

tower is of Edward's time, but its walls were heightened and the tall flag-turret added in the reign of George IV. In addition to the Round Tower, Henry III. had constructed long lines of circuit-walls, crowned at intervals with smaller towers. He also built a great hall (the present chapter library) and other apartments, together with a chapel, which was afterwards pulled down to make room for the chapel of St. George. The beautiful little dean's cloister preserves a portion of Henry's work in the south wall, a contemporary portrait of the king appearing in distemper on one of the arches. Another chapel was built by him and dedicated to his favourite saint, Edward the Confessor. This graceful building, with an eastern apse, is now called the Albert Memorial Chapel; some of Henry III.'s work still exists in the lower part of its walls, but the upper part was rebuilt in 1501–1503 by Henry VII., who originally intended it as a burial place for himself and his line. The unfinished chapel was presented to Cardinal Wolsey by Henry VIII., was roofed in and became known as Wolsey's tomb-house on account of the magnificent tomb he had constructed in it by a Florentine sculptor. The chapel was completed and re-fitted during the last century as a memorial to Albert, Prince Consort, whose cenotaph stands before the altar, with the tombs of Prince Leopold, duke of Albany, and the duke of Clarence; the last erected by King Edward VII., who was himself buried here in May 1910. In a vault beneath the chapel George III. and members of his family are buried.

St. George's Chapel.—The chapel of St. George is one of the finest examples of Perpendicular architecture in England, comparable with two other royal chapels, that of King's College at Cambridge and that of Henry VII. at Westminster, which are a little later in date. The building was begun by Edward IV., who in 1473 pulled down almost the whole of the earlier chapel, which had been completed and filled with stained glass by Edward III. in 1363. The nave of St. George's was vaulted about the year 1490, but the choir groining was not finished till 1507; the hanging pendants from the fan vaulting of the choir mark a later development of style, which contrasts strongly with the simpler lines of the earlier nave vault. In 1516 the lantern and the rood-screen were completed, but the stalls and other fittings were not finished till after 1519. The chapel ranks next to Westminster Abbey as a royal mausoleum, though no king was buried there before Edward IV., who left directions in his will that a splendid tomb was to be erected with an effigy of himself in silver. Nothing remains of this except part of the wrought iron grille which surrounded the tomb, one of the most elaborate and skilfully wrought pieces of iron-work in the world, said to be the work of Quintin Matsys. The next sovereign buried here was Henry VIII., who directed that his body should be laid beside that of Jane Seymour, in a magnificent bronze and marble tomb which was never completed. Charles I. was buried here without service in 1649. Above the dark oak stalls hang the historic insignia of the Knights of the Garter, their swords, helmets and banners.

The deanery, adjoining the dean's cloister, is dated 1500, but the Winchester tower to the north-east of it is the work of the famous prelate and architect William of Wykeham, who was employed by Edward III. on the greater part of this extension and alteration of Henry III.'s work. The Horseshoe cloisters were restored in Tudor style by Sir Gilbert Scott.

The site of the upper ward was built upon by Henry II., and, to a greater extent, by Edward III., but only in the foundations and lowest storey are remains of so early a period to be found. Charles II. completed the so-called Star Building, named from the representation of the star of the Order of the Garter on the north front. Here the state apartments are situated. They include the throne room, St. George's Hall, where meetings of the Order of the Garter are held, the audience and presence chambers, and the grand reception room, adorned with Gobelins tapestries, and the guard-room with armour. All these chambers contain also splendid pictures and other objects of art; but more notable in this connection are the picture gallery, the Rubens room or king's drawing-room, and the magnificent Van Dyck room. The ceilings of several of the chambers were decorated by Antonio Verrio, under the direction of Charles II. In the royal library, which is included among the private apartments, is a fine collection of drawings by the old masters, including three volumes from the hand of Leonardo da Vinci. Here is also a magnificent series of eighty-seven portraits by Holbein, highly finished in sepia and chalk, representing the chief personages of the court of Henry VIII. There are, moreover, examples by Michelangelo and Raphael, though the series attributed to these masters are not accepted as genuine in their entirety.

The Parks.—South of the castle, beside the Home Park, is the Royal Mews. Within the bounds of the park is Frogmore (*q.v.*), with the Royal Mausoleum and that of the duchess of Kent, and the royal gardens. An oak-tree marks the supposed site of Herne's Oak, said to be haunted by the ghost of "Herne the hunter," a forest-ranger who hanged himself here, having fallen under the displeasure of Queen Elizabeth (Shakespeare, *Merry Wives of Windsor*, Act. iv. sc. 4). A splendid avenue of elms, the Long Walk, laid out in the time of Charles II. and William III., leads from George IV.'s gate on the south side of the castle straight into the heart of the Great Park, a distance of 3 m. Another fine and still longer straight avenue is Queen Anne's Ride, planted in 1707. Among various buildings within the park is Cumberland Lodge, built by Charles II. and taking name from the duke of Cumberland, who commanded the victorious royal troops at the battle of Culloden in 1746, and resided here as chief ranger. At the southern boundary of the park is a beautiful artificial lake called Virginia Water.

Windsor Town.—A few old houses remain in the town of Windsor, including houses which belonged to Jane Seymour and Nell Gwynn respectively, but the greater part is modernized. The church of St. John the Baptist was rebuilt in 1822, but contains some fine examples of Grinling Gibbons's wood-carving. The town hall was built in 1686 by Sir Christopher Wren, who represented the borough in parliament. The town was formerly celebrated for the number of its inns, of which there were seventy in 1650. The most famous were the "Garter" and the "White Hart," the first of which was the favourite of Shakespeare's Sir John Falstaff, and is frequently mentioned in *The Merry Wives of Windsor*.

History.—Windsor (*Wyndeshour, Wyndsore, Windlesore*) was probably the site of a Roman settlement, two Roman tombs having been discovered at Tyle-Place Farm in 1865, while a Roman camp and various antiquities were unearthed at St. Leonard's Hill in 1705. The early history of Windsor centres round the now unimportant village of Old Windsor, which was a royal residence under Edward the Confessor; and Robert of Gloucester relates that it was at a fair feast which the king held there in 1053 that Earl Godwin met with his tragic end. By the Confessor it was granted to Westminster Abbey, but was recovered in exchange for two other manors by William I., who erected the castle about 2 m. north-west of the village and within the manor of Clewer, round which the later important town of New Windsor was to grow up. The earliest existing charter of New Windsor is that from Edward I. in 1277, which was confirmed by Edward II. in 1315–1316 and by Edward III. in 1328. This constituted it a free borough and granted to it a gild merchant and other privileges.

Another charter was granted by Edward IV. in 1467. Further confirmations of existing privileges were granted by Edward IV. in 1477, by Henry VII. in 1499, by Henry VIII. in 1515 and by Edward VI. in 1549. A fresh charter was granted by James I. in 1603, was renewed by Charles II., and remained the governing charter until 1835. New Windsor sent two members to parliament from 1302 to 1335 and again from 1446 to 1865, omitting the parliaments of 1654 and 1656; by the act of 1867 it lost one member.

The political history of Windsor centres round the castle, at which the Norman kings held their courts and assembled their witan. Robert Mowbray was imprisoned in its dungeons in 1095, and at the Christmas court celebrated at Windsor in 1127 David of Scotland swore allegiance to the empress Maud. In 1175 it was the scene of the ratification of the treaty of Windsor. The castle was bestowed by Richard I. on Hugh, bishop of Durham,

but in the next year was treacherously seized by Prince John and only surrendered after a siege. In 1217 Ingelram de Achie with a garrison of sixty men gallantly held the fortress against a French force under the count de Nevers. It was a centre of activity in the Barons' War, and the meeting-place of the parliament summoned by Henry in 1261 in rivalry to that of the barons at St. Albans. During the Civil War of the 17th century the castle was garrisoned for the parliament, and in 1648 became the prison of Charles, who spent his last Christmas within its walls.

See J. E. Tighe, *Annals of Windsor* (1858); *Victoria County History: Berkshire;* A. Goddard, *Windsor* (1911); W. H. St. J. Hope, *Windsor Castle* (1913); A. V. Baillie, *Windsor Castle and the Chapel of St. George* (1927).

WINDSOR, a town of Hartford county, Connecticut, U.S.A., on the W. bank of the Connecticut river, at the mouth of the Farmington, adjoining Hartford on the north. It is served by the New York, New Haven and Hartford railroad. Pop. (1920) 5,620; 1928 local estimate 8,000. Windsor keeps its original village green, and a number of beautiful colonial houses, including the Ellsworth homestead, now a historical museum. The building of the Congregational Church (organized in England in 1630) dates from 1794. The first English settlement in Connecticut was a trading post established here in 1633 by Capt. William Holmes of the Plymouth Colony. In 1635 a more important, and permanent, settlement was made by a company from Dorchester, led by the Rev. John Wareham, Roger Ludlow and others. Ancestors of Gen. Grant and Admiral Dewey were original landholders.

WINDWARD ISLANDS, a group and colony in the West Indies, consisting of the British islands of St. Lucia, St. Vincent and Grenada, with a chain of small islands, the Grenadines, between the two latter. They are constitutionally three separate colonies with a common governor-in-chief, who resides at St. George's, Grenada. Each island maintains its own institutions.

WINE. Wine is the living blood of the grape; it is liable to sickness and doomed to death. Wine is the suitably fermented juice of freshly gathered grapes. There is no such thing as unfermented wine, but "wine" is sometimes used in connection with other fruits of the earth, as in *barley wine, apple wine, ginger wine,* to denote a beverage which has fermented, *i.e.,* which is living and vivifying.

Vinous fermentation is a natural phenomenon due to the catalytic action of the zymase of living micro-organisms or ferments known as *Saccharomycetes,* which are present upon the skins of all ripe grapes. These microscopic fungi are slightly different according to various species of grapes and also according to differences in the nature of the soil of the different vineyards.

There is, in the juice of all grapes, a great deal of water—80% of its total weight or more—and there is also a fairly large proportion of grape sugar—15% on an average—a proportion which, however, varies according to the different species of grapes and according to climatic conditions which vary according to the geographical position of each vineyard and atmospheric variations every year. There is also, when freshly gathered grapes are pressed, a large number of *Saccharomycetes* which were originally upon the outside of the grape-skins: they are the suitable yeast provided by nature and they make it possible for the grape sugar of the must to be split up into ethyl alcohol and carbon dioxide, or in other words "to ferment," in a manner which, reduced to its simplest expression, may be explained as follows:

The atomic weights of *Carbon* (C), *Hydrogen* (H) and *Oxygen* (O) are respectively: C = 12; H = 1; O = 16.

Grape Sugar consists of six atoms of *Carbon,* twelve of *Hydrogen* and six of *Oxygen, i.e.:* $C_6H_{12}O_6$. The atomic weight of one molecule of *Grape Sugar* is as follows:

C_6	= 12x6	= 72
H_{12}	= 1x12	= 12
O_6	= 16x6	= 96
	Total	180

After fermentation, the same atomic weight will be found arranged differently, the molecule of *Grape Sugar* having completely disappeared and, in its place, two molecules of *Ethyl Alcohol* and two of *Carbon Dioxide* (carbonic acid gas) having appeared.

Ethyl Alcohol consists of two atoms of *Carbon,* six of *Hydrogen* and one of *Oxygen,* or C_2H_6O; *Carbon Dioxide* consists of one atom of *Carbon* and two of *Oxygen,* or CO_2.

The atomic weight of two molecules of *Ethyl Alcohol,* and two of *Carbon Dioxide* will therefore be as follows:

Ethyl alcohol	C_2	= 12x2 =	24x2 = 48
	H_6	= 1x6 =	6x2 = 12
	O	= 16x0 =	16x2 = 32
			92
Carbon dioxide	C	= 12x0 =	12x2 = 24
	O_2	= 16x2 =	32x2 = 64
			88
Total			180

Vinous fermentation is therefore a molecular re-adjustment of the carbon, hydrogen and oxygen atoms of grape sugar.

Grape juice is not merely a solution of grape sugar in water; it contains a large variety of acids and different other substances, either of vegetal or of mineral origin, which are present in very minute quantities only and yet play a very important part in the type and quality of the wine which will eventually grow out of grape juice. Some of these substances present in the wine were present in the original grape juice; they are chiefly acids of a mineral origin, which have passed from the soil of the vineyard into the grapes and from the grapes into the wine, without being affected by the process of fermentation. Such also are some of the vegetal matter, the cellulose of the grape skins, acids from the stalks, oils from grape pips, for instance, as well as some of the original grape sugar which for some reason or other has not yet fermented. But, after fermentation, there are substances in the wine of which no trace appeared in the grape juice: they are by-products of fermentation and vary according to the chemical composition of the must, or grape juice, and according to the rate and to the manner of fermentation: such are the glycerine, the alcohols other than ethyl alcohol, some acids, esters and aldehydes, which are present only in minute quantities in wine.

Many Varieties.—The different varieties of wine are very numerous. There are wines of all shades of colour from the palest greenish yellow to the darkest red; there are wines which are a little dry or a little sweet and others which are excessively dry or excessively sweet; there are wines which are still and others which are sparkling; there are wines which are ready for consumption when they are quite young and others which are at their best when ten, fifteen, twenty or even fifty years old.

But no wines, whatever their age or colour, origin or price, can be suitable or are ever acceptable unless they are sound. This is the only rule which applies to all wines without exception.

In every part of the world where vines grow and wine is made, there are sound wines made and others which are not sound or become unsound after either a short or long time. A sound wine is a normal wine, a well-balanced wine, an harmonious whole; it is a wine made of the juice of freshly-gathered grapes, either completely or partially fermented and containing nothing but the normal natural by-products of normal vinous fermentation.

"Beverage" Wines.—Natural wines are made from normal grapes, grapes which are ripe but not sun-dried, which are pressed and the juice of which is allowed to ferment naturally and normally with neither hindrance nor interference, until practically the whole of its grape-sugar has been transformed into alcohol, which remains in the wine, and carbon dioxide, which escapes into the air. Natural wines made of normal grapes normally fermented belong to two classes according to the different kinds of grapes which soil, climate and aspect have made it possible to grow. They are either *beverage* wines—*pour la soif*—or *fine* wines.

By far the greatest quantity of wine made in the world, certainly more than 95 per cent., consists of wine which is sound but not fine, wholesome but not exciting, wine which is the most suitable, and usually the cheapest, beverage obtainable in the district where it is made. The bulk of beverage wines is consumed locally, or, at any rate, within the borders of the countries where such wines are chiefly produced, that is to say, in France, Italy, Spain, Por-

tugal, Algeria, Greece, the Balkans, the Cape, Chile, the Argentine and Australia.

Beverage wines are normal wines, some of which possess a fairly high percentage of vinous alcohol, a good colour and plenty of body, but very few are sufficiently well-balanced to improve with age. They usually lack the right kind and proportion of free acids; they lack breed and the esters which give to a wine its individual bouquet. Beverage wines can be and are usually drunk with water; in that form, they are wholesome and cooling.

"Fine" Wines.—Fine natural wines are wines which are perfectly balanced. They are made of the perfectly fermented juice of perfect grapes, that is to say, grapes of the finest species, possessing the right proportion of sugar and acidity, and possessing above all that inestimable quality which for the want of a better word is called "breed."

There is very little fine wine made, compared to the enormous quantities of ordinary beverage wine, and there is no means of buying really fine wine except at high prices. The Gironde and the Côte d'Or are the only two districts in the whole world where a fair quantity of red wine is made, which cannot be improved by the art of the blender.

Fortified Wines.—A fortified wine is a wine to which a certain proportion of brandy or spirit distilled from wine has been added so as to raise its alcoholic strength. This addition of spirit takes place during and after fermentation. Of such a union it may be said that although the contracting parties are distant cousins, yet it is not natural.

This is one of the fundamental differences between beverage and fortified wines; the first need not always be kept more than a short time before it is fit to drink, but the second must always be kept some time.

Fortified wines supply a real want, the want of a generous liquor which will dispel spleen in northern latitudes, where the damp atmosphere and dark grey skies are depressing, and where the people's diet contains necessarily a much larger proportion of fats, the digestion of which is so much more laborious than that of the vegetable diet of the southern races. This is why the peoples of sunny Spain and Portugal consume most of their own beverage wines, whilst they export to the United Kingdom and Scandinavia practically the whole of the fortified wines which are made specially to suit northern climate and requirements.

The fortifying of wine is a perfectly legitimate practice, provided, however, that only sound wine be fortified, and that only spirit distilled from wine be used for the purpose, and provided also, that the wine so fortified be improved thereby.

Fortified wines are not usually made out of the finest types of grapes, but out of the most suitable species grown on the most suitable of sunny lands, which yield grape-juice so rich in grape-sugar, that it is better able to hold its own against the intruder, producing slowly and under difficulties, alcohol of its own, which blends with the added alcohol.

Still and Sparkling Wines.—Carbon dioxide, or carbonic acid gas, is a normal by-product of normal vinous fermentation, and is lighter than wine. If it is given a chance to escape from the wine, during the process of fermentation, carbon dioxide will lose itself in the air, and the wine will be "still." If, on the other hand, a wine is bottled up whilst it is still fermenting, the gas generated will try to escape, but if the bottles are sufficiently strong and the corks securely fastened, it will remain in solution in the wine. When poured out into a glass, this wine will be found to be sparkling, that is to say the carbonic acid gas will leave the body of the wine, rise to the surface and enter the air.

Still wines and sparkling wines may be made out of any and every variety of grapes, but the chief question is one not of "possibility" but of "suitability."

When is it suitable to have carbonic acid gas in a wine? Carbonic acid gas is harmful in large doses but harmless enough in small quantities; it has neither colour, smell nor taste of its own to make it desirable. Its usefulness in wine is due to the fact that it has an intense dislike for it, and is ever trying to get away. When bottled up, the carbonic acid gas inside the bottle, by trying to get out, keeps out the air for a time, but, by degrees, it manages to escape. Carbonic acid gas in a bottle also keeps the balance between the different elements of the wine and acts, for a time at least, as a preservative, hence the better chance which sparkling wines stand on long sea voyages.

But wine can be made to last and to journey overseas quite safely without carbonic acid gas. The high price of sparkling wines is the result of their popularity; the cause of their popularity is their quick action, the rapidity of their stimulating effect.

Why Sparkling Wines Please.—When a sparkling wine is poured out, the carbonic acid gas, which filled the air chamber inside the bottle, is the first to go, and that which is in solution in the wine comes to the surface very quickly at first, and more quietly later. As it leaves the wine, the carbonic acid gas carries with it the more volatile parts, such as the esters, which give to the wine its fragrance, and it helps thus to "show off" the bouquet. When we drink sparkling wine, there are more contact points, and the more numerous the contact points, the quicker will the carbonic acid gas in solution in the wine rise to leave it. In doing so the carbonic acid gas carries with it some of the alcohol, the stimulating action of which is rendered thereby more immediate. Hence, the invaluable properties of sparkling wine in cases of exhaustion, and of self-consciousness, of reticence, of dullness or sluggishness of either thought, digestion or glandular secretions.

All wines might be made into sparkling wines, but only the lighter types of wines are suitable for the purpose, wines with greater "finesse" than strength, with greater "breed" than body, with a bouquet, attractive but not aggressive. Carbonic acid gas in a sparkling wine may be said to intensify the qualities, good and bad, which the wine possesses.

But, if a wine be grown as wine is grown in the Champagne district—the birthplace of sparkling wine—grown upon a soil so poor, under climatic conditions and other conditions so difficult, that large yields are out of the question, and grapes of the finest breed can alone be reared and are grown for quality, not for quantity, then alone can fine still wines be made, which will be still finer as sparkling wines, as is the case with champagne, the pattern of all sparkling wines.

THE VINEYARDS OF THE WORLD

Vines will grow and wine can be made in all but arctic and tropical countries, but by far the greater quantity of wine produced in the world every year comes from that cradle of human civilization which is known as the Mediterranean basin, three fourths of the world wine production coming from the vineyards of France (including Algeria, which is administratively although not geographically part of France), Italy, Spain and Portugal.

France.—France, the largest wine producing country in the world is divided into 89 départements, and in all of them with the exception of a dozen, the furthest north and north-west, vines are grown and wine is made. The average production of wine in France is over a thousand million gallons every year. There are in France a million and a half vineyard proprietors, of whom about a third are small holders who only make a sufficient quantity of wine for the daily requirements of their own household.

By far the largest wine-producing départements are those of the South of France, chiefly the *Hérault, Gard* and *Aude,* formerly known as the province of *Languedoc,* with the stupendous average yearly yield of over 400,000,000 gallons of wine. Practically the whole of this enormous yield is made up of common wines.

There are, however, a few wines of *Languedoc* which are of a very different and far better type. These are dessert wines, mostly made of Muscat grapes, some being fortified and others natural wines. The best of these wines are those of *Lunel* and *Frontignan.* South east of *Languedoc,* the département of *Basses Pyrénées,* part of the former province of *Roussillon,* has long been famous for its rich dessert wines, both red and white. The red wines of *Banyuls,* made from Grenache and Carignan grapes, and the white wines of *Rivesaltes,* made from muscat and white malvoisie grapes are the best.

Next only to the *Hérault,* as regards quantity, but second to

none as regards the excellence of its wines, comes the *Gironde* département. The *Gironde* is the name given to the river Garonne from the *Bec d'Ambès*, below Bordeaux, where it receives the waters of the Dordogne, and until it reaches the Bay of Biscay. The *Gironde* is also as indicated, the name of a département, the chief city of which is Bordeaux. No other département of France, nor any other wine-growing district in the world, produces so large a quantity of fine wines as the *Gironde*. There are, in the *Gironde*, four distinct districts which yield the finest wines; they are the *Médoc* and *St. Emilion* districts for red wines, the *Sauternes* district for white wines and the *Graves* district for both red and white wines. (*See* CLARET, GRAVES, SAUTERNES.)

Moreover, there are within the borders of the *Gironde* département, extensive vineyards in the undulating country between the rivers Garonne and Dordogne called "Entre deux mers"; and there are many also planted in rich alluvial soil either close to the river banks or in the islands in the midst of the broad waters of the Gironde river. A large quantity of wine is made from all such vineyards, wines far from being so fine as the wines of the world-famous *Médoc, Graves* or *St. Emilion* districts, but wines which are entitled to the names of *Claret* and *Bordeaux*, wholesome, useful and fair wines.

Further north and well away from both the Mediterranean sea and Atlantic ocean, three départements which formed part of the ancient Duchy of Burgundy, produce the red and white *Burgundy* wines (*see* BURGUNDY). They are the *Côte d'Or*, the *Saône et Loire* and the *Yonne* départements. The *Côte d'Or* owes its name to a series of hills some thirty-six miles in length, which have proved an inexhaustible gold mine for centuries past, their vineyards producing some of the finest wine in the world.

Immediately below the *Côte d'Or*, much wine of very fair quality although not of the same superlative excellence is made in the valley of the Saône, from the vineyards of the *Côte Chalonnaise* and of the *Côte Maçonnaise*, within the département of *Saône et Loire*, as well as further south, in the valley of the Rhône, from the vineyards of the départements of *Rhône, Isère, Drôme* and *Ardèche*. The finest wines of each of those départements are those of *Côte Rotie* (*Rhône*); *Condrieu* (*Isère*), *Hermitage* (*Drôme*); *St. Péray* (*Ardèche*).

Further south, a large quantity of wine is made in Provence, in the départements of the *Bouches du Rhône, Vaucluse, Var* and *Alpes Maritimes;* most of it is but common red wine from Aramon and Bouschet hybrids, species of prolific and common vines. There are, however, some fair white wines made in Provence, which is mostly used to make *Vermouth*. There is also a very small quantity of sweet wines made of fresh sun-dried muscat grapes as well as a very small quantity of red wine of exceptional merit made in the *Vaucluse* département and known as *Châteauneuf du Pape*.

Further north and east, in the départements of the *Doubs, Haute Saône, Jura* and *Ain* some very interesting wines are made at *Arbois, Château-Chalon* and elsewhere but only in comparatively very small quantities. Further east still, in *Alsace*, between the main range of the Vosges mountains and the Rhine, an average of four million gallons of white wines is produced every year in the départements of the *Bas Rhin* and *Haut Rhin*, wines which are very dry.

Further north and west, once the very heart of the ancient province of *Champagne*, the département of the *Marne* produces that inimitable wine, *Champagne*, which is probably more widely known all the world over than any other wine. (*See* CHAMPAGNE.)

Returning to the Atlantic seaboard by way of the Loire valley, some very beautiful vineyards are to be seen upon both banks of this river, almost continuously during its 620 m. course. The most extensive and prolific vineyards of the Loire valley are those of *Loir et Cher, Indre et Loire, Maine et Loire* and *Loire Inférieure*. The first three are responsible for the best wines, both red and white, of the former Provinces of *Touraine* and *Anjou*. The red wines come mostly from vineyards south of the Loire and the white chiefly from the silicious hills of the right bank of the river.

South of the Loire, in the two départements of the *Charente* and *Charente Inférieure* and also in parts of the two neighbouring départements of *Deux Sèvres* and *Dordogne*, much white wine is made every year but most of it is distilled into brandy, the only brandy entitled to the name of *Cognac*. Further south, brandy is also made in the département of *Gers*, the only brandy entitled to the name of *Armagnac*.

Although France is the largest wine-producing country in the world, she imports from one to two hundred million gallons of wine every year more than she exports, the greater part of the wine thus imported for home consumption coming from *Algeria*.

Italy.—Italy is the second largest wine-producing country in the world but she is also the second largest wine-consuming country in the world and her production not having increased at the same rate as her population, the surplus of Italian wines available for export is comparatively small. The great majority of the wines of Italy are beverage wines of no particular merit, which are consumed when still quite young; they are made to meet the demand for cheap, young beverage wines, a demand which is very great. The best Italian beverage wines come from the north, namely, *Chianti* and *Barolo;* the best dessert wines come from the south and are shipped from *Marsala*.

Spain.—Spain is the third largest wine-producing country in the world. There are few parts of Spain where good wine is not made or could not be made. In order of importance, the chief wine-producing provinces of Spain are the following: *New Castile, Catalonia, Levante, Aragon, Old Castile, Leon, Eastern Andalucia, Western Andalucia, Galicia, Extremadura, Vascongadas*. The best and the most universally renowned wine of *Western Andalucia* is undoubtedly *Sherry*. (*See* SHERRY.)

Eastern Andalucia, in the south south-eastern corner of Spain, is covered with vineyards and produces large quantities of table grapes and raisins. There are also different sorts of wine made in Eastern Andalucia, of which the best is that which is made from Pedro Ximenez and shipped under the name of *Malaga* from the port of that name. *Malaga* owes much of its excellence to the art of the blender. It is made up of new wine, to which is added either some *vino tierno* or some *vino maestro*, first of all, and some *vino de color*, later on.

The province of *Levante* produces a very large quantity of different wines, the two types which are the best and the best known abroad being the wines of *Valencia* and *Alicante*.

The province of *Catalonia* is the second largest wine-producing province of Spain and its wines are chiefly known abroad under the name of *Tarragona*, a fortified wine made in the same way as *Port* but lacking the breed and bouquet of the latter; needless to say it is also much cheaper.

Portugal.—There are large quantities and many varieties of red and white still and sparkling wines made in Portugal, but the wine which has earned for Portugal a world-wide reputation is undoubtedly the best wine of the Douro Valley, fortified at the time of the vintage and eventually shipped from *Oporto* under the name of *Port*. (*See* PORT.)

Germany.—Climatic conditions as well as the nature of the soil make it impossible to grow vines with any measure of success in any of the northern, eastern and central parts of Germany. It is only in the most southern and western lands and even there only at the cost of incessant labour and intelligent care, that it is possible to grow vines which will yield grapes suitable for wine-making purposes. The vineyards of Germany covered, before 1914, a little less than 300,000 acres divided in the following proportions:

Alsace-Lorraine	25·88%
Bavaria	18·69%
Prussia	15·36%
Baden	14·58%
Württemberg	13·12%
Hessen	11·59%
All others	0·78%

Since the return of Alsace-Lorraine to France, Germany has fewer vineyards than most Balkan States and her production of wine which was already far below her own requirements before the war, has become very much more inadequate since. Hence the

considerably increased cost of German wines since the war, an increase which, however, has very little, if at all, checked their sale, either at home or abroad. This is due to the fact that Germany produces white wines of superlative excellence, wines as distinctive as they are inimitable, the output of which is so limited that the supply never outpaces the demand. Of the forty-six million gallons of wine which, in a good year, are produced in German vineyards, some 80% or 85% are white wines and the rest are red. A large proportion of the total output consists merely of beverage wines which are consumed locally, but in *Rhenish Prussia*, in *Hessen* and in the *Bavarian Palatinate* some exceedingly fine wines are produced in years when climatic conditions have been suitable.

The finest wines of Germany are white wines of which there are two generally acknowledged types, *i.e.*, *Hocks* and *Moselles*. *Hocks* are wines from the Rhinegau, Rhinehesse and Bavaria, wines widely different as regards breed, bouquet and general excellence, but wines which are, or should be, in the majority of cases, full-bodied, more "vinous" and of a deeper golden colour than Moselle wines; they age better also, acquiring in time more bouquet and more colour as well as greater strength. *Moselles*, on the contrary, are more delicate, lighter both as regards body and colour, and reach perfection much sooner, being delightful wines very often when quite young. (*See* HOCKS and MOSELLES.)

Other European Countries.—Extensive vineyards are cultivated and much wine is made in *Greece, Czechoslovakia, Rumania, Bulgaria, Austria, Hungary, Switzerland* and the *Crimea*, but, with the exception of the Hungarian *Tokay*, the wines of all these countries are not of a sufficiently superlative quality to have earned a world-wide reputation.

America.—In North America there is a comparatively small quantity of wine made in *Canada* and there are very extensive vineyards in *California*. In South America, the *Argentine* and *Chili* are the two largest wine-producing countries but there is wine made also, upon a much smaller scale, in Peru, Brazil and Uruguay.

Africa.—In Northern Africa, the vineyards of *Algeria, Tunisia* and *Morocco* produce some 250 million gallons of red and white wines, mostly red, every year, whilst in South Africa, where vineyards have been cultivated at the *Cape* since the seventeenth century, some eight million gallons of wine are made every year, a quantity which could easily be increased considerably should there be a greater demand both in South Africa and overseas.

Australia.—The vinous output of Australia has increased considerably since the Great War, owing chiefly to the grant of "Irrigation" lands to ex-service men, lands which produce very abundant crops of the prolific Dorandillo grape, a common species of grape from which a wine is made which is only fit for distillation. The plentiful supply of cheap grape brandy makes it possible for Australia to send to England ever increasingly large quantities of fortified wines, wines which being rich in natural grape sweetness and of a high alcoholic strength are more and more in demand among the working classes.

Island Vineyards.—Much wine and some very famous wine has been made for many centuries past and is still made in some of the islands of the Mediterranean Sea and of the Atlantic Ocean.

In the Mediterranean, the most ancient and renowned island vineyards are those of *Cyprus*, which produced the *Vinum Creticum*, which was greatly in honour in imperial Rome, and the *Malmsey*, which the Genoese first brought to England in the Middle Ages. *Cyprus* still produces on an average three million gallons of wine every year.

In all the islands of the Greek Archipelago vines grow luxuriantly and much wine is made; even in Malta, the average yearly yield of wine is over 700,000 gallons.

In the Atlantic Ocean, three groups of islands have been famous ever since the early part of the seventeenth century for their wines, *i.e.*, the *Canary Islands*, the *Azores* or *Western Islands* and *Madeira*. From the *Canaries*, where the Spaniards introduced viticulture at an early date, came a strong wine of the sherry type which is often praised in Shakespeare's and Ben Jonson's plays under the name of *Canary Sack*. The wine which is still shipped from *Teneriffe* is no longer praised by the poets.

Fayal, one of the *Azores*, produced a wine which was greatly prized during the late seventeenth century and the first half of the eighteenth century by the colonists of New England, Pennsylvania, Virginia and in the West India Islands. The quantity of wine made now in the *Azores* is very small.

Not so *Madeira*, where much wine, some very fine, is still being made upon an important scale. (*See* MADEIRA.)

CONSUMPTION OF WINE IN ENGLAND

In Roman and Saxon Days.—The Romans, during their occupation of Britain were probably the first to import wine into England from the Continent, but no documentary evidence of the existence of the English wine trade has as yet come to light earlier than the fifth century. Moreover, it was not before the ninth century that we find regular shipments of wine from Rouen to both England and Ireland, though, during the tenth century, this branch of commerce had acquired sufficient importance to become a source of revenue for the Royal Exchequer, six shillings per ship of wine having to be paid at Billingsgate by merchants arriving from Rouen.

Saxon records make manifest that before the Norman Conquest, wines were already in general use, in Britain, for a variety of purposes, wines which are described as being either "clear, strong, austere, soft, sweet, etc." During the eleventh century, the wholesale and retail branches of the wine trade were distinct and both were flourishing.

The Rise of Claret.—By the marriage, in 1152, of Eleanor of Aquitaine to Henri Plantagenet, Duke of Anjou and Normandy, who became King Henry II. the following year, Bordeaux and some of the fairest vineyards of France passed under the rule of England and remained under it during three consecutive centuries. The claret trade in England dates from that time.

The privileged position of "Gascon" wines, as most wines shipped from Bordeaux were usually called, is evidenced by the royal cellars purchase accounts which have been preserved to this day. When in 1212, King John paid £507.11s.0d. for 358 casks of wine, the proportion of Gascon wine was nearly 75% of the whole, *i.e.*: Gascon wine, 267 casks; Orleans, 54; Anjou, 8; Auxerre, 26; and German, 3.

In London, where the Gascon merchants were numerous, wealthy and powerful, the citizens and aldermen challenged many times their rights and privileges which were conflicting with the terms of royal charters obtained at great expense by the Londoners themselves. Eventually, the Gascon vintners had to make up their mind either to give up their Gascon nationality and settle in England permanently, or else to give up their former privileges and go back to Bordeaux not later than forty days after landing their wines in England and selling them to London vintners, who were alone to deal with them, either wholesale or by retail.

Wine and British Shipping.—One of the results of the objection taken by the citizens of London to the ancient trading liberties of Gascon vintners in the Metropolis was to divert a fairly large share of the Bordeaux wines to other parts of the Kingdom, chiefly Bristol, Hull, Southampton and Chester, but also to Portsmouth, Exmouth, Sandwich, Winchelsea, Rye, Lynn, Ipswich, etc.

In 1335, Edward III., having prohibited all export of coin, Bordeaux merchants were made to purchase in exchange of their wines goods which they did not want or did not understand sufficiently to buy well; in consequence, they preferred to go to Flemish, Dutch and Hanseatic ports and they ceased almost entirely to come to Great Britain. Hence, the King, the more wealthy lords, both spiritual and temporal, as well as English vintners, were obliged to send to Bordeaux their men, their ships and their money to buy the supplies of wine of which they stood in need. This change was mainly responsible for the rapid increase of the naval strength and maritime preponderance of England. Until then, Gascons, Flemings, Genoese and Germans shared among themselves practically the whole of the carrying trade, and the necessity which forced English merchants to go

overseas and fetch wines which foreign traders refused to bring over any longer was of the utmost benefit to the country. The supremacy of the English mercantile marine dates from then.

It was also during the reign of Edward III. that the practice originated of a number of ships sailing from some appointed English port and on some officially appointed day and proceeding to Bordeaux in fleet formation, in order to be better able to defend themselves from attack. Such fleets sailed usually in the late autumn and returned home before Christmas with the "new" wines; they sailed again in the following spring, usually soon after Easter, and returned with the "rack" wines.

Early Laws and Regulations.—When the wine-laden ships reached an English port, the attorneys of the King's Butler or "yeomen of the Butlery," had to be advised; their office consisted in taking two casks of wine per ship, or their equivalent value in money, for the King's right of "prise" or "prisage"; they also purchased whatever quantity of wine they had been instructed to secure for the royal cellars and army, as well as for the numerous lay and ecclesiastical beneficiaries of the King's bounty.

Only then could the wine be landed and stored in vaults on or near the quay-side. This landing could only be effected by officially recognised "wine-drawers," skilled in this work, of which they enjoyed the absolute monopoly.

Once landed, the wine had to be passed by the "Gauger," the buyer and seller each paying this official one halfpenny per tun of wine gauged, and it could then be sold, but, again, the services of an official "broker" were required to make the sale binding. This broker had to see that the price demanded by the seller was not beyond the maximum price fixed by authority from time to time for different sorts of wine; he also had to see that the importer of wine sold his wine wholesale, and only to those who were free to buy wholesale, viz., peers, vintners and taverners.

The retailer of wine had also many royal and municipal ordinances to comply with. Not only were the maximum retail prices fixed, but further, wines of different kinds were not allowed to be kept in the same cellar; the consumer had the right to see his wine drawn from the cask; the Vintners' Company in London and Municipal authorities in the provinces, had the right to enter the premises of any taverner, and demand to test the wines stored therein and condemn them to be destroyed if they thought fit.

A Penny a Gallon.—Prices, however, remained sufficiently low during five hundred years for wine to be within the reach of a very large number of people throughout the land, the wine trade of England being prosperous.

From 12th century records we learn that the average price of wine in England was then a penny per gallon. The lowest rate at which we find wine quoted is under one halfpenny per gallon, in 1159, in London, and the highest is twopence per gallon, in 1174, for "French" and "Moselle" wines.

During the 13th century, "wine," "Gascon" wine and wines of "Anjou," "Auxerre," "Oléron," "France," "La Réole," "Moselle," were sold in all parts of the country at prices varying from three farthings up to threepence halfpenny per gallon, the average price being about twopence per gallon.

During the 14th century, the average price of "Gascon" wine, the wine which then formed probably ninety per cent of the total wine imports, rose to about threepence halfpenny per gallon. The lowest recorded was twopence-farthing in 1343, at Berwick-on-Tweed, and the highest, fourpence-farthing, in London 1338. Poitou and Rochelle wines cost rather less than Gascon and there was a rate of three halfpence a gallon charged in London in 1303, for "old wine," which meant perhaps "too old," *i.e.*, defective wine.

On the other hand, *Vernage*, a sweet wine from Italy, was sold at 2s. per gallon, at Durham, in 1335, and *Crete* wine at 4s. in 1360. Rhine wine was sold at 1s. 2d. per gallon, in 1340, at Durham, at sixpence halfpenny, in 1367, and elevenpence, in 1380, at King's Lynn.

Changes in Taste and Fashion.—The chief feature of this century is the decline in the consumption of "Gascon" or beverage wine, and the increased popularity of a large variety of sweet, or at any rate sweeter wines from Spain, Portugal, Italy and the islands of the Mediterranean, such as Bastard, Tyre, Romeney, Malmsey, Osey, Vernage and Hippocras. Irrespective of the "assize" or official maximum prices of all such wines, their cost varied greatly according to their quality, style, scarcity and popularity; thus whilst Malmsey cost but tenpence per gallon at Norwich in 1424, Osey 1s. at Warwick in 1405, and at Cambridge, in 1414, Vernage cost 2s. 8d. per gallon at Warwick in 1405, and Hippocras 3s. 4d. at Cambridge in 1488.

During the 16th century, references to "Gascon" wine are much less numerous. This wine was still imported on a large scale, but, was more commonly known under the name of "claret," the price of which rose steadily from eightpence per gallon in 1510, to 2s. 8d. in 1592, in spite of the fact that its "assize" price was still eightpence per gallon in 1538 and 1539, 1s. in 1565, 1s. 1d. in 1571 and 1s. 4d. from 1578 to 1581.

The price of Rhenish wine also rose during the same period from 1s. per gallon, in 1508, to 3s. 4d. in 1594.

The sweet wines of all kinds, Malmseys, Muscadells and Muscadine, Romeney, Fimoy, Hippocras, etc., continued to be largely imported and were sold at prices varying from tenpence per gallon to as much as 8s. (for Hippocras) in 1587.

During the 16th century a notable event was the introduction and the immediate popularity of *Sack*, the price of which rose from tenpence per gallon in 1533, to 4s. 8d. in 1598, in spite of the fact that its "assize" price was but 1s. 1d. per gallon as late as 1571.

The cheapest wines of all during the 16th century were those shipped to England from La Rochelle, mostly thin white wines from Poitou and Angoumois, but their price rose very much during the latter part of the century. Their "assize" price was only fourpence per gallon as late as 1553, but it was fixed at 1s. 2d. from 1578 to 1781.

During the 17th century, French wines practically ceased to be imported and the taste for beverage wines, for the pure and natural juice of the grape, gradually died out throughout the country. Sweet wines retained their popularity, strong wines heralded strong waters, cordials made their appearance, and ardent spirits began to be imported from abroad, distilled at home and consumed in all parts of the land.

Popularizing Port.—When William of Orange ascended the English Throne, his arch-enemy Louis XIV. was at the zenith of his glory. Louis's power on the Continent, the hospitality he accorded to the exiled Stuarts, his treatment of the Huguenots, and Colbert's commercial policy, were all calculated to inspire the king and the people of England with feelings of hatred against France and everything that was French. When Queen Anne succeeded William III., her Government knew that any measure likely to cause serious prejudice to the French was sure to be immensely popular. They accordingly sought to ruin one of the most important and prosperous branches of France's trade, the trade in wines, by admitting the wines of Portugal in England on payment of £7 per tun, whilst the wines of France were to pay £55 per tun. This was the object of the famous Methuen Treaty signed in 1703.

The consumption of Port wine in England did not increase materially for many years after the Methuen Treaty, but the consumption of French wines declined so rapidly, that the proportion of Portuguese wines consumed in England increased from 40 per cent. of the total, at the close of the seventeenth century, to 72 per cent, at the close of the eighteenth century.

An Epoch-making Change.—During the first half of the nineteenth century, the wine trade of England was in the hands of a comparatively small number of private wine-merchants, who obtained their supplies either direct from abroad or from a few large wholesale houses in London. The two principal qualities good wine was expected to possess were colour and sugar. Nobody, then, would have dared deny that the first duty of a wine was to be red and its second to be sweet. Stout dark vintage ports were the rule; full, sweet sherries and brown Madeiras were their only competitors in the public favour. Sweet Champagne was becoming more popular amongst the wealthy classes, and there was a small but regular demand for the finest hocks and clarets Ger-

many and France could produce.

This state of affairs came to an abrupt end in the sixties when Gladstone revolutionized the wine trade of England. On February 29, 1860, the duty on every description of wine was lowered to 3s. per gallon. On January 1st, 1861, this uniform rate was superseded by the imposition of a scale of duties, based on alcoholic strength, according to Sykes' hydrometer, ranging from 1s. per gallon on wines containing less than 18 degrees of alcohol, to 2s. 11d. per gallon on wines containing 45 degrees of alcohol. On April 3rd, 1862, this scale was further revised and lowered, all wines containing less than 26 degrees of alcohol being admitted at the rate of 1s. per gallon, whilst those containing more, up to 42 degrees, were to pay 2s. 6d. per gallon.

The Wine Trade Revolutionized.—This amounted to a drastic reduction in the duties on wine and was bound to have an immediate and considerable influence upon the consumption of wine in England but Gladstone went even further. When, in 1860, he introduced his first measure for lowering the duties on wine, he concurrently brought in a Bill to facilitate its consumption, by granting free scope to keepers of refreshment houses of good character to sell wine on the premises, on payment of certain Excise licences. This Bill was followed by the "Single Bottle Act" of 1861, which enabled all shopkeepers to retail wine to be drunk off the premises. Furthermore, whilst a "dealer" in wine had to pay ten guineas for a wine-merchant's licence, "any person (not being a dealer) who kept a shop for the sale of any goods or commodities other than foreign wines, in England and Ireland," was allowed to sell wine not to be consumed on the premises, by retail, in reputed quart or pint bottles only, on payment of fifty shillings for an "off licence."

That measure proved more far-reaching than the reduction of duties. It opened new channels to the activities of grocers, drapers, limited liability companies, brewers, co-operative societies and others. It threw the wine trade open to all, since every shopkeeper was free to sell wine on payment of fifty shillings.

WINE-TABLE, a late 18th-century device for facilitating after-dinner drinking—the cabinetmakers called it a "Gentleman's Social Table." It was always narrow and of semicircular or horseshoe form, and the guests sat round the outer circumference. In the earlier and simpler shapes metal wells for bottles and ice were sunk in the surface of the table; they were fitted with brass lids. In later and more elaborate examples the tables were fitted with a revolving wine-carriage, bottle-holder or tray working upon a balanced arm which enabled the bottles to be passed without shaking. Wine-tables are now exceedingly scarce.

WINFIELD, a city of southern Kansas, U.S.A., on the Walnut river, in the fertile Arkansas river valley, at an altitude of 1,124 ft.; the county seat of Cowley county. It is on Federal highway 77, and is served by the Frisco, the Missouri Pacific, the Santa Fe and electric railways. Pop. (1925), 11,483 (largely native white). It is in a rich agricultural region, and there are oil-fields in every direction. The city was founded in 1870 and incorporated in 1871. Since 1921 it has had a commission-manager form of government.

WINGATE, SIR FRANCIS REGINALD (1861–), British general and administrator in the Sudan, was born at Broadfield, Renfrewshire, on June 25, 1861, the seventh son of Andrew Wingate of Glasgow and Elizabeth Turner. He was educated at the Royal Military Academy, Woolwich, and became a lieutenant in the Royal Artillery in 1880. He served in India and Aden from 1881 till 1883, when he joined the Egyptian army, and in the Gordon relief expedition of 1884–85 was A.D.C. and military secretary to Sir Evelyn Wood. He took part in the operations on the Sudan frontier in 1889 and 1891. In 1894 he was governor of Suakin. His principal work was in the Intelligence of which he became director in 1892. He was a master of Arabic. He published in 1891 *Mahdiism and the Egyptian Sudan,* an account of the rise of the Mahdi and of subsequent events in the Sudan. He helped Father Ohrwalder and two nuns to escape from Omdurman in 1891. Wingate also arranged for the escape of Slatin Pasha in 1895. He translated Father Ohrwalder's narrative (*Ten Years in the Mahdi's Camp,* 1892) and Slatin's book (*Fire and Sword in the Sudan,* 1896).

As director of military intelligence he served in the campaigns of 1896–98 which resulted in the reconquest of the Sudan. In an interval (March–June 1897) he went to Abyssinia as second in command of the Rennell Rodd mission. He now became colonel, an extra A.D.C. to Queen Victoria, and was created K.C.M.G. Wingate led an expeditionary force which in Nov. 1899 defeated the remnant of the Dervish host at Om Debreikat, Kordofan, and was made K.C.B. In December, on Lord Kitchener being summoned to South Africa, Wingate succeeded him as governor-general of the Sudan and sirdar of the Egyptian army. In 1903 he became major-general and in 1908 lieutenant-general. In 1909 Wingate undertook a special mission to Somaliland to report on the military situation. In Dec. 1916 he relinquished the governorship of the Anglo-Egyptian-Sudan to be high-commissioner for Egypt until his resignation in Oct. 1919. He had received the G.B.E. in Jan. 1918, and was created a baronet in June 1920.

WINKELRIED, ARNOLD VON. The incident with which this name is connected is, after the feat of William Tell, the best known and most popular in the early history of the Swiss Confederation. We are told how, at a critical moment in the great battle of Sempach, when the Swiss had failed to break the serried ranks of the Austrian knights, a man of Unterwalden, Arnold von Winkelried by name, came to the rescue. Commending his wife and children to the care of his comrades, he rushed towards the Austrians, gathered a number of their spears together against his breast, and fell pierced through and through, having opened a way into the hostile ranks for his fellow-countrymen, though at the price of his own life.

Evidence of Chronicles.—The earliest known mention of the incident is found in a Zürich chronicle (discovered in 1862 by G. von Wyss), which is a copy, made in 1476, of a chronicle written about 30 years earlier; it occurs also in *De Helvetiae origine,* written in 1538 by Rudolph Gwalther (Zwingli's son-in-law). In both the hero is nameless. Finally, we read the full story in Giles Tschudi's chronicle (1564), where the hero becomes "a man of Unterwalden, Arnold von Winckelried by name."

K. Bürkli (*Der wahre Winkelried,—die Taktik der alten Urschweizer,* Zürich, 1886) concluded that the phalanx formation of the Austrians, as well as the name and act of Winkelried, have been transferred to Sempach from the fight of Bicocca, near Milan (April 27, 1522), where a real leader of the Swiss mercenaries in the pay of France, Arnold Winkelried, really met his death in much the same way.

Authorities.—See in particular Theodor von Liebenau's *Die Schlacht bei Sempach—Gedenkbuch zur fünften Säcularfeier* (1886), published at the expense of the government of Lucerne. *See* also the summary in K. Dändliker's larger *Geschichte der Schweiz,* i. 550–559 (3rd ed., Zürich, 1893); O. Kleissner, *Die Quellen zur Sempacher Schlacht und die Winkelriedsage* (Göttingen, 1873).

WINKLE: *see* Periwinkle.

WINNEBAGO. This Siouan tribe of the west side of Lake Michigan at present divided between Wisconsin and Nebraska. Their closest ethnic relatives are the Siouan Iowa, Oto and Missouri to the south-west; culturally they affiliated rather with their Algonkin neighbours, such as the Menominee, Sauk and Fox.

WINNETKA, a residential village of Cook county, Illinois, U.S.A., on Lake Michigan, 17 m. N. of Chicago. It is served by the Chicago and North-Western and the Chicago, North Shore and Milwaukee railways. Pop. 6,694 in 1920; estimated locally at 11,500 in 1928. The village was incorporated in 1869.

WINNIPEG (Cree, *Win*, murky; *nipiy*, water), the capital of Manitoba and chief city of western Canada. It is situated in the south-eastern part of the province, at the juncture of the Assiniboine and Red rivers, 60 m. N. of the United States boundary and 45 m. S. of Lake Winnipeg, from which it takes its name. The population of Greater Winnipeg was 290,000 in 1928 (est.).

The first white explorer in the west, La Verendrye, erected Fort Rouge here in 1738, but the place was abandoned until the next century, when the fur-trading companies—The Nor'-Westers of Montreal and the Hudson's Bay company—were engaged in bitter rivalry for the control of the west. In 1806 Fort Gibraltar was built by the Nor'-Westers, and a few years later the Hudson's Bay company erected Fort Douglas near-by. Lord Selkirk, then head of the company, was the first to see possibilities of farming in the fertile Red river valley. In the years 1811–15 he brought out several hundred settlers from his native Scotland, and, in spite of hardships and neglect, they gradually built up a little colony. Meanwhile, the fur-traders' warfare culminated in bloodshed and in the merging of the two companies in 1821, under the name of the Hudson's Bay company. Fort Gibraltar, renamed Fort Garry, became a chief trading post and settlers' depot. In 1835 a second Fort Garry was built. As the settlers increased, in spite of the antagonism of the fur company, a straggling little hamlet grew up outside the walls of the fort, which was given the name of Winnipeg. The transfer of the territory by the Hudson's Bay company to the Canadian Government in 1870, and the establishment of a governor at Fort Garry brought a new impetus to settlement, and an increase of shipping by the Red river, from St. Paul in Minnesota.

With the completion of the Canadian Pacific railway in 1885, the western part of Canada gained direct communication with the east, and Winnipeg became a great distributing centre. This position it still holds. It is the western headquarters of the Canadian Pacific and the Canadian National railways. It has direct communication with the United States by the Soo Line, the Great Northern and the Northern Pacific railways. Every year the Immigration officials receive at Winnipeg thousands of settlers and direct them to their destinations in the four western provinces. The opening of mining territory in northern Manitoba by the Hudson Bay railway, and the development of mining fields near the eastern boundary of Manitoba, have added to Winnipeg's importance as a distributor of machinery and goods. There are numerous wholesale houses, and the mail order business from Winnipeg is enormous. The aerial exploration of Northern Canada, and the shipping of supplies and men to that section by aeroplane, have been established by Winnipeg companies. The exports of Western Canada, chiefly agricultural, must pass through Winnipeg, as through a funnel, before being shipped east. In 1927 Western Canada produced 414,900,000 bu. of wheat; of this amount 406,186,650 bu. were inspected at Winnipeg, making it the chief primary grain market in the world. Winnipeg holds annual fur auctions, attended by buyers from all over the continent.

Cheap and abundant electric power, developed on the Winnipeg river by the Winnipeg Electric Railway company, and by the municipally-owned Hydro-Electric company, has brought rapid industrial development. The most important products are: flour, grain products, implements, paper boxes, confectionery, meat and meat products, whitefish from the lakes, bricks and gypsum. At Winnipeg the Canadian Pacific has two large railway yards with 110 m. and 125 m. of track and extensive railway shops, and the Ford Motor company has a large assembling plant.

Winnipeg has wide streets, many of them planted with trees; two large parks, Kildonan and Assiniboine, and many small parks; and municipal golf links, besides several golf clubs. The water supply is derived from Shoal lake 100 m. away. There are 42 banks and branches, 122 churches and missions, several hospitals and charitable institutions, the University of Manitoba with affiliated colleges, including the Agricultural college with its beautiful grounds, large military barracks and Tuxedo Military hospital, where disabled veterans are cared for. The most noteworthy public buildings are the Law Courts, and the Parliament House approached by the beautiful Victory Mall.

St. Boniface on the other side of the Red river is a separate municipality with a population largely French-Canadian. It is the Roman Catholic headquarters of the west, and contains a cathedral, a convent, a hospital, an archiepiscopal palace and St. Boniface college. It has large stockyards and flour mills.

WINNIPEG, a lake and river of Canada. The lake is in Manitoba, between 50° 20′ and 53° 50′ N. and 96° 20′ and 99° 15′ W., has an area of 8,555 sq.m., is at an altitude of 710 ft., is 260 m. long, 25 to 60 m. wide, and has several large islands, including Reindeer (70 sq.m.) and Big Island (60 sq.m.). It is nowhere more than 70 ft. deep. Its shores on the south are extremely marshy. The principal affluent rivers are: Red river, from the south; Winnipeg, Bloodvein, Berens and Poplar from the east; and the Dauphin and Saskatchewan from the west. It receives the surplus waters of lakes Manitoba and Winnipegosis, and discharges by the river Nelson into Hudson Bay. The river Winnipeg rises near Savanne station in 48° 47′ N. and 89° 57′ W., and flows in a westerly direction under the names of Savanne, Seine and Rainy rivers to the Lake of the Woods; issuing thence as the Winnipeg, it flows north-west to the lake of the same name. The river has power installations totalling 226,000 h.p. chiefly supplying the city of Winnipeg.

WINNIPEGOSIS, a lake of Manitoba and Saskatchewan, Canada, between 51° 34′ and 53° 11′ N. and 99° 37′ and 101° 06′ W. Its greatest length is 122 m.; greatest width 17 m.; shoreline 570 m.; and area, exclusive of islands, 2,000 sq.m. Its greatest ascertained depth is 38 ft., and mean altitude 828 ft. above the sea. It drains by the Waterhen river through Waterhen lake into Lake Manitoba, and thence by the Little Saskatchewan into Lake Winnipeg. It was discovered by La Verendrye in 1739.

WINONA, a city of Minnesota, U.S.A., on the Mississippi river, 103m. S.E. of Saint Paul; the county seat of Winona county. It is on Federal highways 14 and 61, and is served by the Burlington Route, the Chicago and North Western, the Chicago Great Western, the Chicago, Milwaukee, St. Paul and Pacific, and the Green Bay and Western railways, motor bus lines, and river barges. Pop. (1920) was 19,143 (84% native white) and was estimated locally at over 22,000 in 1928. Winona is picturesquely located on a broad level terrace at the foot of steep bluffs rising 500 to 600ft. above the river. It is the centre and headquarters of the Mississippi Wild Life and Fish Refuge, established by Congress in 1924. Winona is a manufacturing city, with many and varied industries (notably flour, proprietary medicines, spices, farm machinery, food products, shoes, fur clothing and automobile accessories), with an output in 1925 valued at $20,095,139. The site of Winona was long occupied by an Indian village, and it was frequently used as a landing place in the fur-trading days. White settlement began in 1851. The city was laid out in 1852 and chartered in 1857. A large part of it was destroyed by fire in 1860.

WINOOSKI, a city of Chittenden county, Vermont, U.S.A., on the Winooski river and the Central Vermont railway, adjoining Burlington on the north-east. Pop. (1920) 4,932 (24% foreign-born white); 1928 local estimate over 7,500. The city has important manufactures of cotton and woollen goods, screen doors and windows, and various other commodities. It is the seat of St. Michael's college (1905). Winooski was founded in 1772 by Ira Allen, and was known as Allen's Settlement.

WINSLOW, EDWARD (1595–1655), a founder of the Plymouth colony, was born in Droitwich, England, on Oct. 18, 1595. In 1617 Winslow removed to Leyden, united with John Robinson's church, and in 1620 was one of the "Mayflower pilgrims." His wife, Elizabeth (Barker) Winslow, having died soon after their arrival, he married, in May, 1621, Mrs. Susannah White, the mother of Peregrine White (1620–1704), the first white child born in New England. This was the first marriage in the New England colonies. Winslow was one of the "assistants" from 1624 to 1647, except in 1633–34, 1636–37 and 1644–45, when he was governor of the colony. In 1643, he was one of the commissioners of the United Colonies of New England. On several occasions he was sent to England in the inter-

12. Bob-sledding over a sharp turn at St. Moritz, Switzerland

ests of Plymouth and Massachusetts bay. He left on his last mission as the agent of Massachusetts bay, Oct. 1646, and spent nine years in England, where he held minor offices under Cromwell. Winslow's portrait, the only authentic likeness of any of the "Mayflower pilgrims," is in the gallery of the Pilgrim Society at Plymouth, Massachusetts. His writings, though fragmentary, are of great value to the historian of the Plymouth colony. Some of them may be found reprinted in Alexander Young's *Chronicles of the Pilgrims* (Boston, 1841).

BIBLIOGRAPHY.—J. B. Moore's *Memoirs of American Governors* (1846); David P. and Frances K. Holton's *Winslow Memorial* (1877), and J. G. Palfrey's *History of New England* (Boston, 1858–64). Also *see* a paper by W. C. Winslow, "Governor Edward Winslow, his Place and Part in Plymouth Colony," in the *Annual Report of the American Historical Association* for 1895 (Washington, 1896), and vol. xxxi. of the *American Historical Review*.

His son, JOSIAH WINSLOW (1629–1680), was educated at Harvard college, was elected a deputy to the General Court in 1653, was an "assistant" from 1657 to 1673, and governor from June 1673 until his death.

WINSOR, JUSTIN (1831–1897), American historian, was born in Boston (Mass.) on Jan. 2, 1831. As a student at Harvard he showed his scholarly tastes by historical and literary articles and for a number of years thereafter continued his newspaper and periodical work. He found his true vocation, however, when his success as temporary superintendent of the Boston Public Library caused him to receive the permanent appointment and when in 1877 President Eliot took him to Harvard as librarian. He edited *The Narrative and Critical History of America* (8 vol. 1884–89), a mammoth co-operative work, for the rich bibliographical and historical notes of which he was largely responsible; he also wrote histories: *Christopher Columbus* (1891), *Cartier to Frontenac* (1894), *The Mississippi Basin* (1895), and *The Westward Movement* (1897). He died in Cambridge (Mass.) on Oct. 22, 1897.

WINSTED, a city of Litchfield county, Connecticut, U.S.A., 25 m. N.W. of Hartford, on the Mad and the Still rivers. It is served by the New York, New Haven and Hartford railroad. Pop. (1920) 8,248 (80% native white); 1928 local estimate 10,000. The city has an elevation ranging from 600 to 1,500 ft. above sea-level, and it lies in the midst of the beautiful Litchfield hills region. Winsted was settled in 1756, chartered as a borough in 1858 and incorporated as a city in 1915.

WINSTON-SALEM, a city of North Carolina, U.S.A., formed in 1913 by the consolidation of the city of Winston and the adjoining town of Salem; a port of entry and the county seat of Forsyth county. It is on Federal highways 121 and 311, and is served by the Norfolk and Western, the Southern and the Winston-Salem Southbound railways. Pop. 48,395 in 1920 (43% negroes); estimated locally at 84,000 in 1928. It is on the Piedmont plateau, at an altitude of 1,000 ft., 30 m. from the Blue Ridge. Salem, the old part of the city, has many interesting old houses, and is the seat of Salem college for women (established by the Moravians as an academy in 1772). A state teachers' college for negroes is located here. Winston-Salem manufactures more tobacco products than any other city in the world, the ten factories employing 18,000 persons and paying revenue taxes to the amount of $190,000,000. The city's assessed valuation for 1928 was $141,210,043.

Salem was founded in 1766 by Friedrich Wilhelm von Marschall (1721–1802) a friend of Zinzendorf, to be the centre of a Moravian colony for which 100,000 ac. in North Carolina had been purchased. It remained under exclusive Moravian control until 1849. In 1856 land was first sold to outsiders, and the town was incorporated. Winston was founded in 1851 as the county seat, and was named for Maj. Joseph Winston (1746–1815), a famous Indian fighter and Revolutionary soldier.

WINTERBERRY, the name given to several North American shrubs of the holly genus (*Ilex*) with deciduous leaves and persistent, showy fruit. The Virginia winterberry (*I. verticillata*), called also black alder, found from Connecticut to Wisconsin and south to Florida and Missouri, grows from 6 ft. to 25 ft. high, with slightly hairy leaves, about 3 in. long, and bright red fruit. The similar smooth winterberry (*I. laevigata*), found from Maine to Georgia, has smaller, very smooth leaves and orange-red fruit.

WINTER FAT (*Eurotia lanata*), a small North American shrub of the goose-foot family (Chenopodiaceae), native to subalkaline soils from Saskatchewan to Washington and south to Texas and California. It is a low white-woolly shrub, 1 ft. to 2 ft. high, with many slender branches, narrow leaves, and small flowers in axillary clusters, the fruiting involucres bearing tufts of silvery-white hairs. It is a valued winter forage for cattle.

WINTERGREEN, known botanically as *Gaultheria procumbens,* a member of the heath family (Ericaceae), a small creeping, evergreen shrub with numerous short erect branches bearing in the upper part shortly-stalked oval, thick, smooth shining leaves with a sharp-toothed edge. The flowers are borne singly in the leaf axils and are pendulous, with a pale pink waxy-looking urn-shaped corolla. The bright crimson-red sub-globular, berry-like fruit consists of the much-enlarged fleshy calyx which surrounds the small thin-walled many-seeded capsule. The plant is a native of shady woods on sandy soil, especially in mountainous districts, in southern Canada and the northern United States; it is quite hardy in England. The leaves are sharply astringent and have a peculiar aromatic smell and taste due to a volatile oil known as oil of wintergreen, which is used in medicine in the treatment of muscular rheumatism (for the therapeutic action *see* SALICYLIC ACID). An infusion of the leaves is used, under the name mountain or Salvador tea, in some parts of North America as a substitute for tea and the fruits are eaten under the name of partridge or deer berries. Other names for the plant are tea-berry, checker-berry, box-berry, spice-berry and ground holly. Its counterpart on the Pacific coast is the salal or shallon (*G. Shallon*), a slender shrub, 1 to 6 ft. high, with black berries; it is found in the coastal redwood belt of California and northward to British Columbia.

WINTERHALTER, FRANZ XAVIER (1806–1873), German portrait painter, was born at Menzen-Schwand, Black Forest, on April 20, 1806. In 1823 he went to Munich to study under Stieler and afterwards established himself in Karlsruhe, where he became a protégé of the Grand Duke Leopold. He excelled in the representation of elegant, graceful ladies, exhibiting regularly at the Salon from 1835–68 and at the Royal Academy from 1852–67. In 1857 he was made *officier* of the Legion of Honour. He died at Frankfurt on July 9, 1873.

His portraits include those of Louis Philippe (Calais), the duc d'Aumale (Chantilly), the Prince Consort (National Portrait Gallery, London), Queen Victoria, the duchess of Kent, Napoleon III. and Empress Eugénie, the Empress of Russia, and others.

WINTER'S BARK, the bark of *Drimys Winteri,* an evergreen tree belonging to the magnolia family (Magnoliaceae). It was formerly officinal in Europe, and is still held in esteem in Brazil and other parts of South America as a popular remedy for scurvy and other diseases. The plant is a native of the mountains and highlands from Mexico to the Strait of Magellan.

WINTER SPORTS. For a number of years previous to 1900 experiments had been made in using the Alps as a winter playground, for climbing, skating and other recreations. In the first quarter of the 20th century this form of amusement became rapidly more popular and since 1910 the development of winter sports has been more marked than during any previous period.

Sports in Switzerland.—In Switzerland the post-War development was due in a large measure to the electrification of the Swiss railway system: in 1912 a committee of experts examined the question of electrification as a means of coal economy, and in 1913 electrically propelled trains were introduced on the Engadine express route from Coire onwards. During the years 1914–18 the work was necessarily suspended, but in 1919 the engineers of the Swiss Federal and Rhaetian railways resumed operations, and at an approximate cost of 18,800,000fr. the whole system was electrified. This opened up a good many small resorts which had been previously inaccessible. In 1910 there were approximately 45 resorts to which people went for organized winter sports, but in 1927 the number had been increased to 92, with an approximate increase of 180 per cent in the number of passengers travelling from Great Britain to Swiss resorts direct.

Among the many famous resorts in the States bordering Switzerland are Kitzbühel, Tirol, a quaint old city, and the Arlberg district, the Continent's classical skiing territory. In the higher altitudes skiing is kept up well into May and June. Austria is one of the leading countries for winter sports in Europe. The Semmering, winter sport centre and fashionable resort, has one of the best and oldest ski jumps and bobsleigh runs on the Continent. Italy has excellent skiing territory in her newly acquired provinces. Of international fame is Cortina d'Ampezzo.

The Olympic Games.—Ski running, skating, ice-hockey, ski jumping and other winter sports are included in the programme of the Olympic games—though of necessity held at a time and place distinct from games not dependent on snow conditions. The Alpine games at the eighth Olympiad were held at Chamonix in Feb. 1924, and the winter sports of the ninth Olympiad at St. Moritz in Feb. 1928. In 1924 Norway was the winning nation with 134½ points, Finland finished second with 76½ points; Great Britain third, 30 points; the United States of America fourth, 29 points; Sweden 26 points; Austria 25 points; Switzerland 24 points; France 19½ points; Canada 11 points; Czechoslovakia 8½ points; Belgium 6 points and Italy 1 point.

In 1928 Norway won with 90½ points; the United States second with 50½ points; Sweden, third, 40 points; Finland, fourth, 39½ points; Austria, fifth, 22 points; Canada, sixth, 13½ points; Switzerland, seventh, 6 points; Argentine, eighth, 5 points.

Women are allowed to compete in certain events at the Olympic games, and their participation in the figure skating contests at the eighth Olympiad was of great assistance to the British team.

Bobsleighing has become very popular; at most Swiss resorts there is a specially constructed run, the one at St. Moritz and the Schatzalp run at Davos being among the better known. In bobsleighing, the *ventre à terre* position is now almost universal. The developments in ski running are largely due to the test system instituted by the Ski Club of Great Britain, and the standard of running has greatly improved in consequence.

The United States.—Snow and ice sports are popular in the United States. The natural resources of the Adirondack mountains, allied to the natural enterprise of the American sportsman, have provided winter sports which challenge comparison with those of Switzerland. At Lake Placid, one of the largest American resorts, the season opens early in Dec. and about 1,500 people can be accommodated in the club house, its annex, and the cottages which are a feature of this winter sport centre. The skiöering, often spelled skikjöring, races in the frozen waters of the lakes attract large crowds of spectators. The Inter-Vale ski jump, which is the principal sporting contest, takes place on the anniversary of Washington's birthday, Feb. 22. Skiing is the favourite winter sport, although skating is popular, and skaters are very well provided for. There are special rinks for curling, figure skating and ice-hockey. Bobsleighing, ski-öering and tobogganing (*q.v.*)—on the flat American type of toboggan—are all sports subsidiary to skiing at Lake Placid, which is becoming one of the most popular resorts for families during the Christmas holidays.

In New England several resorts are available, such as Woodstock (Vt.), Picketts (N.H.), and Toy Town, Winchendon (Mass.). Within 30m. of New York city there are various smaller places, such as Briarcliff Lodge, catering to week-end visitors; an annual ski jumping contest takes place here on Washington's birthday. Chicago has skating contests which attract a large number of contestants and visitors, and there are several rinks in New York city which attract thousands of people every evening during the winter.

Canada.—In Canada climatic conditions are more favourable to snow and ice sports than those existing in the United States. The season is longer, the temperature much lower and steadier, and particularly in Ontario and the Maritime provinces, the snowfall is greater. Snow-shoeing, tobogganing and skating have been popular winter sports for years, and in Manitoba and eastern Canada can be enjoyed usually without a break from November to March. Ice-hockey enjoys a great vogue with the younger element, and contests between the leading clubs attract enormous crowds. The Canadian team won the ice-hockey contest at the Olympic games of 1924, their brilliant play as a team enabling them to beat the Americans, who played their way to the finals. Ski running and jumping is of comparatively recent introduction, but is becoming increasingly popular. Curling is extensively played, interest in it being periodically stimulated by the visits of representatives of prominent Scottish curling clubs. The centre of winter sport is Montreal.

In Ottawa the Ski Club now numbers 2,000 members, and the Cliff Ski Club has an equally large membership. The annual curling Bonspiels, held at Montreal, Toronto, Winnipeg and other centres, attract competing teams from all parts of Canada and contiguous territory of the United States. (V. M. C.)

WINTERTHUR, a flourishing industrial town in the Töss valley, canton of Zürich, Switzerland, and by rail 17 m. N.E. of Zürich. It is 1,450 ft. above sea-level, and has a rapidly increasing population (in 1870, 9,317; in 1880, 13,502; in 1900, 22,335; in 1920, 46,969; and in 1928, estimated at 53,150), all German-speaking and nearly all Protestants.

The Roman settlement of *Vitudurum* (Celtic *dur,* water) was a little north-east of the present town, at the place now known as Ober Winterthur. It was refounded in the valley in 1180 by the counts of Kyburg (their castle rises on a hill, 4 m. to the south of the town), who granted it great liberties and privileges, making it the seat of their district court for the Thurgau. In 1264 the town passed with the rest of the Kyburg inheritance to the Habsburgs, who showed very great favour to it, and thus secured its unswerving loyalty. It was a Habsburg stronghold for two centuries; but after the conquest of the Thurgau by the Swiss Confederates (1460–1461) it was sold to the town of Zürich (1467), its rights and liberties being reserved, and its history since then has been that of the other lands ruled by Zürich.

Winterthur is the point of junction of seven lines of railway.

See J. C. Troll, *Geschichte d. Stadt Winterthur* (8 vols., 1840–50); and *Dict. géogr. de la Suisse,* Vol. VI. (1910).

WINTHER, CHRISTIAN (1796-1876), Danish lyrical poet, was born on July 29, 1796 at Fensmark, Praestö, where his father was priest. He began to publish verses in 1819. In 1851 he received a pension from the state, and for the next quarter of a century he resided mainly in Paris. Besides some nine or ten volumes of lyrical verse, Winther published *The Stag's Flight,* an epical romance in verse (1855); *In the Year of Grace,* a novel (1874); and other works in prose. He died in Paris on Dec. 30, 1876, but the body was brought to Denmark, and was buried in the heart of the woods.

WINTHROP, JOHN (1588–1649), Puritan leader and first governor of Massachusetts, was born in Edwardston, Suffolk, England, Jan. 12 (old style), 1588. In 1602 he matriculated at Trinity college, Cambridge, but he did not graduate. He next practised law and achieved considerable success, being appointed, about 1623, an attorney in the court of wards and liveries, and also being engaged in the drafting of parliamentary bills. His income rose to the sum of £700 a year, when, for reasons now unknown, he suddenly in 1629 lost his appointment. A Puritan, he had made wide acquaintance among the leaders of the Puritan party. On Aug. 26, 1629, he joined in the "Cambridge Agreement," by which he and his associates pledged themselves to remove to New England, provided the Government and patent of the Massachusetts colony should be removed thither. On Oct. 20, 1630, he was chosen governor of the "Governor and Company of the Massachusetts Bay in New England," and sailed in the "Arbella" in March 1630, reaching Salem, Mass., June 12 (old style), accompanied by a large party of Puritan immigrants. After a brief sojourn in Charlestown, Winthrop and many of his immediate associates settled in Boston in the autumn of 1630. There he lived until his death on March 26 (old style), 1649.

Winthrop's history in New England was very largely that of the Massachusetts colony, of which he was 12 times chosen governor by annual election, serving in 1629–34, 1637–40, 1642–44, and 1646–49, and dying in office. He was usually deputy governor and always assistant when not actually governor. He gave all his strength, devotion and fortune to the colonies. He was conservative and somewhat aristocratic, but just and magnanimous in

his political guidance even under circumstances of great difficulty. In 1634–35 he was a leader in putting the colony in a state of defence against possible coercion by the English Government. He opposed the majority of his fellow-townsmen in the so-called "Antinomian Controversy" of 1636–37, taking a strongly conservative attitude towards the questions in dispute. He was the first president of the Commissioners of the United Colonies of New England organized in 1643. He defended Massachusetts against threatened parliamentary interference once more in 1645–46. The colony's early success was due largely to his skill and wisdom.

Winthrop's *Journal,* an invaluable record of early Massachusetts history, was printed in part in Hartford in 1790; the whole in Boston, edited with valuable notes by James Savage, as *The History of New England from 1630–1649,* in 1825–26, and again in 1853; and in New York, edited by James K. Hosmer, in 1908. Many letters to him are found in the *Winthrop Papers* published by the Massachusetts Historical Society (*Collections,* series 4, vols. vi. and vii.; series 5, vol. i., 1863–71). His biography has been written by Robert C. Winthrop, *Life and Letters of John Winthrop* (1864, new ed. 1869); and by Joseph H. Twichell, *John Winthrop* (1892). *See* also Mrs. Alice M. Earle, *Margaret Winthrop* (1895).

WINTHROP, JOHN (1606–1676), known as John Winthrop the Younger, son of the preceding, born at Groton, formerly a small rural village lying about midway between Wadleigh and Sudbury in Suffolk, England, Feb. 12, 1606. He attended the Bury St. Edmunds grammar school and Trinity college, Dublin, studied law for a short time after 1624 at the Inner Temple, London, accompanied the expedition of the duke of Buckingham for the relief of the Protestants of La Rochelle. In 1631 he followed his father to Massachusetts and was an "assistant" in 1635, 1640, 1641 and from 1644 to 1649. He was the chief founder of Agawam (now Ipswich), Mass., in 1633; went to England in 1634 and returned the following year as governor (for one year) of Connecticut, under the Saye and Sele patent, sending out the party which built the fort at Saybrook. He was again in England in 1641–43, and on his return to Massachusetts established ironworks at Lynn and Braintree. He became magistrate of Connecticut in 1651; in 1657–58 was governor of the colony; and in 1659 again became governor, and was annually re-elected until his death in Boston on April 5, 1676. In 1662 he obtained in England the charter uniting the colonies of Connecticut and New Haven. In 1675 Winthrop was further honoured by being chosen a commissioner of the United Colonies of New England. In England he received the additional distinction of election to membership in the newly organized Royal Society.

His correspondence with the Royal Society was published in series 1 vol. xvi. of the *Massachusetts Historical Society's Proceedings. See* T. F. Waters' *Sketch of the Life of John Winthrop the Younger* (Ipswich, Mass., 1899); *John Winthrop* by E. T. James (London, 1925); *John Winthrop, Jr.* by F. J. Kingsbury—Amer. Antiq. Soc. (Worcester, 1898).

Winthrop's son, FITZ-JOHN WINTHROP (1638–1707), was educated at Harvard, though he did not take a degree; served in the Parliamentary Army in Scotland under Monck, and returned to Connecticut in 1663. As major-general he commanded the unsuccessful expedition of the New York and Connecticut forces against Canada in 1690; from 1693 to 1697 he was the agent of Connecticut in London; and from 1698 to 1707 was governor of Connecticut.

WINTHROP, ROBERT CHARLES (1809–1894), American orator and political leader, a descendant of Governor John Winthrop (1588–1649), was born in Boston, Mass., on May 12, 1809. He graduated at Harvard in 1828, studied law with Daniel Webster and in 1831 was admitted to the bar. He was a member of the Massachusetts house of representatives in 1834–40—for the last three years as speaker. From 1840 to 1850, except for a short intermission (April–Dec. 1842), he was a representative in the lower house in Congress. He soon became prominent and was speaker of the 30th Congress (1847–49), though his conservatism on slavery and kindred questions displeased extremists, North and South, who prevented his re-election as speaker of the 31st Congress. In July 1850 he was appointed to the seat in the U.S. Senate left vacant by Daniel Webster's resignation, but was defeated in the regular election held in the following year by a coalition of Democrats and Free Soilers. In the same year (1851) h was defeated for governor of Massachusetts by the same coalitio Thereafter he was never a candidate for political office. With th breaking up of the Whig Party he became an independent, an supported Millard Fillmore in 1856, John Bell in 1860 and Ge G. B. McClellan in 1864. He was president of the Massachuset Historical Society from 1855 to 1885. He died in Boston, o Nov. 16, 1894.

Among his publications were *Addresses and Speeches* (1852–86) *Life and Letters of John Winthrop* (1864–67); and *Washingto Bowdoin and Franklin* (1876). *See* R. C. Winthrop, Jr., *Memoir R. C. Winthrop* (1897); and C. F. Adams, Jr., *Theodore Lyman an Robert Charles Winthrop, Jr.* (1906).

WINTHROP, a town of Suffolk county, Massachusett U.S.A., occupying a peninsula jutting out into Massachusetts ba 5 m. N.E. of Boston, between Chelsea and Revere. It is serve by the Boston, Revere Beach and Lynn railroad. Pop. (1925 16,158 (State census). It is a residential suburb and has larg summer hotels, four yacht clubs and many private estates. Wi throp was set off from North Chelsea and incorporated as a tow in 1852, being named after Deane Winthrop (1623–1704), who home is still standing. In the early days the peninsula was know as Pullen Poynt, because the currents around it made hard pullir for the boatmen. From the middle of the 18th century man prominent Boston families had seaside homes here, and it r mained a secluded retreat until the railway was built in 1876.

WINTON, an anthracite-mining borough of Lackawann county, Pennsylvania, U.S.A., on the Lackawanna river, 9 m N.E. of Scranton; served by the Delaware and Hudson, th Lackawanna (for freight only) and the New York, Ontario an Western railways. Pop. (1920) 7,583 (31% foreign-born white

WINWOOD, SIR RALPH (*c.* 1563–1617), English pol tician, was born at Aynhoe in Northamptonshire and educate at St. John's College, Oxford. In 1599 he became secretary t Sir Henry Neville (*c.* 1564–1615), the English ambassador i France, and he succeeded Neville in this position two years late retaining it until 1603. In this year Winwood was sent to Th Hague as agent to the States-General of the United Province and according to custom he became a member of the Dutc council of state. His hearty dislike of Spain coloured all h actions in Holland; he was anxious to see a continuance of th war between Spain and the United Netherlands, and he expresse both his own views and those of the English government at th time when he wrote, "how convenient this war would be for th good of His Majesty's realms, if it might be maintained witho his charge." In June 1608 Winwood signed the league betwee England and the United Provinces, and he was in Holland whe the trouble over the succession to the duchies of Jülich and Clev threatened to cause a European war. In this matter he negotiate with the Protestant princes of Germany on behalf of James Having returned to England Sir Ralph became secretary state in March 1614 and a member of parliament. In the Hou of Commons he defended the king's right to levy imposition and other events of his secretaryship were the inquiry int the murder of Sir Thomas Overbury and the release of Raleig in 1616. Raleigh was urged by Winwood to attack the Spanis fleet and the Spanish settlements in South America, and th secretary's share in this undertaking was the subject of con plaints on the part of the representatives of Spain. In the mid of these complex activities he died in London on the 27th October 1617.

Winwood's official correspondence and other papers passed to th duke of Montagu, and are now in the possession of the duke Buccleuch. They are calendared in the Report of the Historic Manuscripts Commission on the manuscripts of the duke of Bu cleuch. *See* the *Introduction* to this *Report* (1899); and also S. R Gardiner, *History of England,* vols. ii. and iii. (1904–1907).

WINZET, NINIAN (1518–1592), Scottish polemical write was born in Renfrew, and was probably educated at the universit of Glasgow. He entered into conflict with Knox and other lea ing reformers. He appears to have acted for a time as confess to Queen Mary. In July 1562, when engaged in the printing his *Last Blast,* he narrowly escaped the vengeance of his opp nents, who had by that time gained the upper hand in the capit

and he fled (Sept. 3) with the nuncio Gouda to Louvain, and then to Paris. At Queen Mary's request he joined Bishop Leslie on his embassy to Queen Elizabeth in 1571, and remained with the bishop after his removal by Elizabeth's orders to ward at Fenny Staunton, Huntingdonshire. When Leslie was committed to the Tower, Winzet returned to Paris. There he continued his studies, and in 1574 left for Douai, where in the following year he became a licentiate. He was in residence at Rome from 1575 to 1577, and was then appointed by Pope Gregory XIII. abbot of the Benedictine monastery of St. James, Regensburg. There he died on Sept. 21, 1592.

Winzet's works are almost entirely controversial. In his *Buke of Four Scoir Thre Questions* (1563) he treats of church doctrine, sacraments, priesthood, obedience to rulers, free-will and other matters.

Winzet's vernacular writings have been edited by J. Hewison for the S.T.S. (2 vols., 1888, 1890). The *Tractates* were printed, with a preface by David Laing, by the Maitland Club (1835). For Winzet's career *see* Zeigelbauer, *Historia rei literariae* O.S.B. iii., Mackenzie, *Lives*, iii., and the Introduction to S.T.S., edit. *u.s.*

WIRE. The making of wire is one of the most ancient of the metal-working crafts. When man discovered the need of a piece of drawn-out bar or rod of any kind of metal for the purpose of ornaments, tools, hooks, or fastenings, then the first piece of wire was manufactured. It is more than likely that this was of copper or gold, as both of these metals would be found in their native state and would lend themselves to being beaten or drawn out. Samples of brass wire more than 2,000 years old have been discovered, and these, judging by the markings on their surface, seem to have been made by passing metal through the tapered hole of a drawplate.

The metal-working artists of Nuremberg in Bavaria, who formed wire by the use of the hammer alone, were styled wire-smiths, but later, when the drawplate was introduced, their designation was changed to wire-drawers or wire-millers, and as this occurred as early as 1351 and 1360 in the history of Augsburg and Nuremberg respectively, it is conceivable that the invention of the method of modern wire-drawing should be assigned to the 14th century. The earliest wire made by the use of the drawplate was manufactured by main force, the workmen pulling the wire directly through the tapered hole in the plate by attaching its end to a belt around his waist and stepping backwards away from the drawplate. The *windlass* type of pull was next adopted, and after this water power was applied.

It is possible that iron wire was manufactured about the middle of the 15th century in England, as at that period the importation into England was prohibited. In 1565 patents were granted to certain Dutchmen or Germans for the prosecution in England of various manufactures, among which was that of wire, and a works was set up at Tintern in Monmouthshire for the purpose of introducing and practising the art of wire-drawing. Previously all English iron wire appears to have been drawn by manual strength in the Forest of Dean and elsewhere. Copper and brass wire was manufactured about the year 1649 at Esher, and the first wire-mill in England was set up at Sheen, near Richmond, by Dutchmen, in 1662.

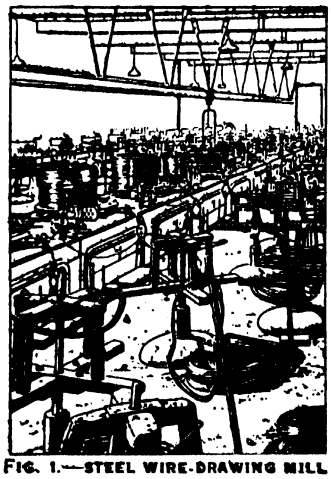

FIG. 1.—STEEL WIRE-DRAWING MILL

When the rolling of bars came into use, wrought iron for wire-drawing purposes was rolled into rods of about ½ in. diameter, the weight of the piece usually being about 28 lb.; but the introduction of mild steel or ingot iron has changed the character of the wire-drawing trade.

The raw product which comes into a wire works is the rolled rod of ½ in. or larger diameter from the steel mill, this having been rolled down from billets about 2 in. square. One of the most important processes in connection with the making of wire is the proper cleaning of rods, so as to free them entirely from any form of scale, this latter being extremely detrimental to good wire-drawing. The general practice is to submerge the rods in cisterns

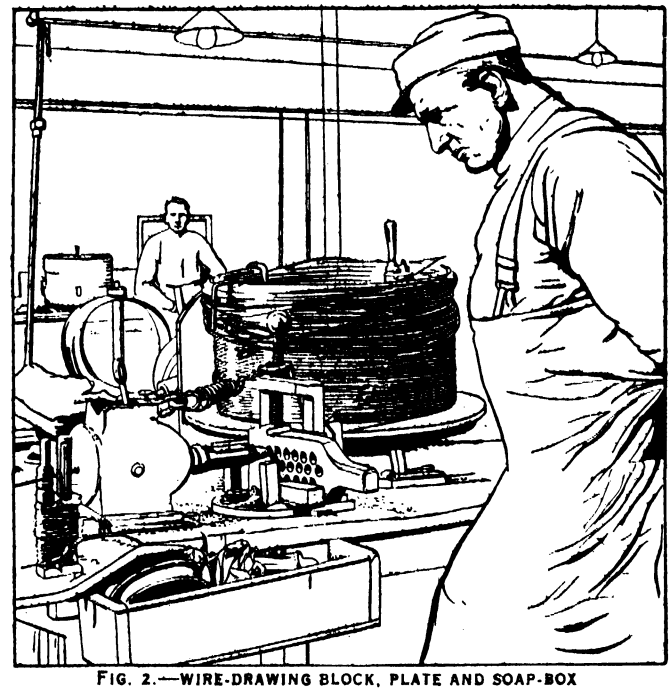

FIG. 2.—WIRE-DRAWING BLOCK, PLATE AND SOAP-BOX

of dilute hydrochloric acid until the whole of the scale has been removed. The rods are then well washed and allowed to stand in the air until they are "browned" or coated with a film of ferric-hydrate. This "coating" is exceedingly important, as the subsequent drawing of the wire to fine gauges depends very largely upon it. After coating, the rods are dipped into a vat of hot lime-water and then dried in ovens.

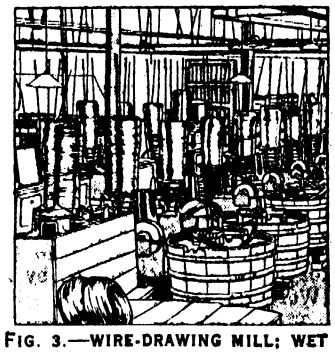

FIG. 3.—WIRE-DRAWING MILL; WET PROCESS

Methods of Wire-drawing. —Two general processes of wire-drawing are in vogue—one known as the "dry" and the other as the "wet" method. A wire mill in which the dry method is used is shown in fig. 1. On the left the line of swifts or reels which carry the rods will be seen, whilst the blocks on to which the wire is wound after being pulled through the drawplate are shown along the centre of the benches. A closer view of the soap-box, drawplate, and block is shown in fig. 2. This illustrates how the wire passes from the swift through the soap-box, the conical hole of the die, and on to the winding block. It will be noticed that the die contains a large number of holes, this form of die enabling the wire-drawer to pass readily to a correct size of hole when the one in use has become worn. Hard dried olive oil soap is used as a lubricant, this being broken into small pieces before being placed in the soap-box.

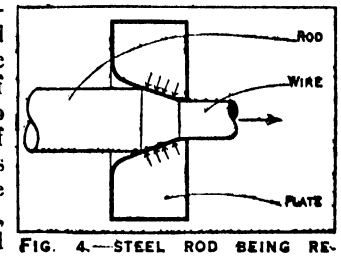

FIG. 4.—STEEL ROD BEING REDUCED TO WIRE IN PASSING THROUGH PLATE

In wet drawing the wire or rod is first coated with a thin film of copper, deposited by passing the rod or wire through a special solution containing sulphate of copper. The wire then passes through a soapy solution and on through the hole of the draw-

plate. This method of wire-drawing a hard metal within a shell or skin of a softer metal was first used by Dr. Woolaston for drawing fine wire in the beginning of the 19th century, and in practice it gives very good results. A wire mill in which wire is drawn by the wet process is shown in fig. 3.

A continuous process of wire-drawing is now in use for the production of steel, copper, brass, and other kinds of wire. The method consists in carrying the wire continuously from one block to another through interposed drawplates and thus on to a final winding block. The blocks may be on separate spindles or superimposed on a vertical spindle, as shown in fig. 3. The advantage of this method is that it saves the handling of the wire between the various passes or drafts.

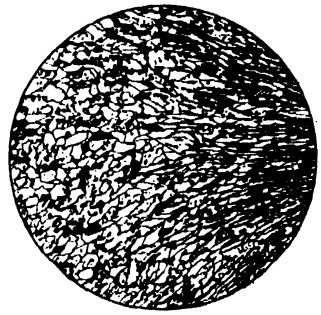

FIG. 5.—PHOTOMICROGRAPH, MAGNIFICATION 100 DIAMETERS, SHOWING CRYSTAL GRAINS BEING COMPRESSED

The hot-rolled rods which are used for the drawing of steel wire are usually in pieces weighing about 160 lb., each piece when of 5 gauge (·212) being about a quarter of a mile in length. This when drawn to 10 gauge (·128) increases to about three times its length; if drawn to 20 gauge (·036) its lengths will be about nine miles; and if drawn further to 30 gauge (·0124) it will have a length of about 70 miles. It will thus be seen that a 5 gauge rod being drawn down to 30 gauge increases its length about 280 times.

As the wire passes through the drawplate (fig. 4) it is subjected to enormous pressure, which in some cases amounts to as much as 150 tons per sq. inch. The "flow" of mild steel in passing through the hole of the plate is illustrated by fig. 5, in which full sized grains are shown on the left and the elongated or crushed grains on the right. The speed at which wire passes through a drawplate varies according to the diameter and quality of the material to be reduced. For soft steel this speed may run up to as much as 1,000 ft. per minute. The reduction of area per draft varies according to the quality of steel being drawn and the kind of wire required; it may be as high as 40% or as low as 10%.

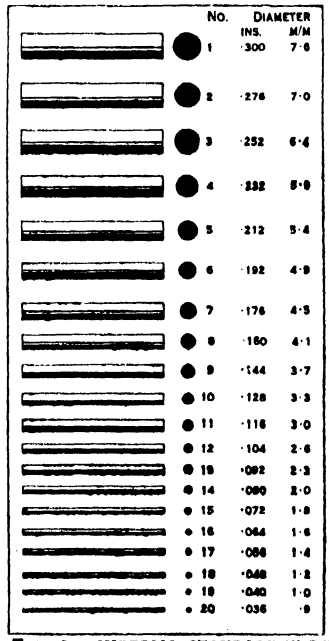

FIG. 6.—IMPERIAL STANDARD WIRE GAUGE

The physical properties of steel are altered as it passes through the wire-drawing process, the chief alteration being a rapid increase in its tensile strength and a reduction in its elongation. For instance, a 5 gauge rod having a tensile strength of 32 tons per sq. in. will, in drawing down to 17 gauge, have its tensile strength doubled.

The softer metals such as copper, and alloys such as brass, are drawn in a manner similar to steel, the difference being in the methods of cleaning and annealing; also, with the softer metals a larger use is made of methods of continuous drawing in which wires may be drawn down to very fine gauges by the simultaneous reduction of nine or more passes in one operation.

Wiredrawers' plates may be cast iron, plain carbon steel, or alloy steel, and small hard dies are sometimes made of a compound largely composed of carbide of tungsten, while for fine copper or other soft metal drawing diamond dies are used. (*See* GALVANIZING.) (E. A. A.)

WIRED WIRELESS: *see* ELECTRICAL POWER TRANSMISSION; ELECTRICITY SUPPLY: TECHNICAL ASPECTS.

WIRELESS TELEGRAPHY. It was propounded by J. Clerk Maxwell in his paper "On a Dynamical Theory of the Electromagnetic Field" (1865) and in his treatise on *Electricity and Magnetism* (1873) that electric action is propagated through free space in the form of a disturbance which travels with the velocity of light. In 1888 Heinrich Hertz published an account of his experiments on the electromagnetic effects of rapid electrical oscillations, and showed that the result of such oscillations was the propagation of a periodic disturbance through space which had the characteristics of wave-motion. In the following year Hertz supplemented his experiments by a mathematical treatment of the electric and magnetic forces which are to be expected in the space surrounding electricity in vibration. Hertz's analysis, which was based on Maxwell's Electromagnetic Theory, supplies us with the theoretical basis of the method of producing electric waves now used in wireless communication. A wireless transmitter is a device for producing rapid oscillatory motion of electricity which is the origin of electric waves. Such electric waves are detected at a wireless receiving station by the effects of the rapidly varying electric and magnetic forces which constitute the electric wave-motion.

In the experimental oscillator used by Hertz the electricity may be considered as surging to and fro, simulating the action of an electric doublet the moment of which is alternatively positive and negative. Let us suppose that such an electric doublet is situated at the centre O of a sphere of radius r so that its axis coincides with the axis OZ (*see* fig. 1). Further, let the electric moment of the doublet be a prescribed function of the time $F(t)$. The results of Hertz's analysis show that the electromagnetic field, due to the doublet, at any point r, θ on the sphere, consists of an electric force with tangential and radial components $E\theta$ and E_r respectively, together with a magnetic force $H\phi$ at right angles to both these components, where

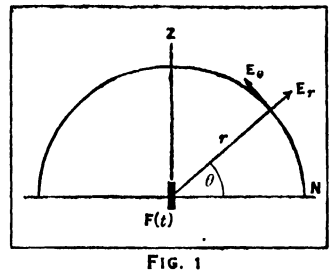

FIG. 1

$$E_\theta = \cos\theta\left(\frac{f}{r^3} + \frac{f'}{cr^2} + \frac{f''}{c^2 r}\right), \qquad (1)$$

$$E_r = 2\sin\theta\left(\frac{f}{r^3} + \frac{f'}{cr^2}\right), \qquad (2)$$

and

$$H_\phi = \cos\theta\,\frac{f'}{cr^2} + \frac{f''}{c^2 r}, \qquad (3)$$

where f, f' and f'' are written for $F\left(t-\frac{r}{c}\right)$, $F'\left(t-\frac{r}{c}\right)$ and $F''\left(t-\frac{r}{c}\right)$ respectively, since the values of the electric and magnetic forces depend on the events taking place at the origin $\frac{r}{c}$ seconds previously, c being the velocity of the electromagnetic disturbance in free space.

Since, in practical applications, we are mainly concerned with cases in which the electric moment varies periodically, and in which the observational point is at right angles to the axis of the doublet (*e.g.*, N in fig. 1) we may write $F(t) = M_0 \sin\omega t$ and $\theta = 0$. Thus (1) and (3) become

$$E = \frac{M_0 \sin\psi}{r^3} + \frac{M_0\omega\cos\psi}{cr^2} - \frac{M_0\omega^2\sin\psi}{c^2 r}, \qquad (4)$$

and

$$H = \frac{M_0\omega\cos\psi}{cr^2} - \frac{M_0\omega^2\sin\psi}{c^2 r}, \qquad (5)$$

where $\psi = \omega\left(t-\frac{r}{c}\right)$, and the subscripts of E and H are omitted. The terms in the expression for E may, for convenience, be named the electrostatic, induction and radiation terms respectively. In the expression for the magnetic force there are only the induction and radiation terms.

If we consider only points at such distances from the origin that

$$\frac{\omega r}{c} \gg 1$$

we see that the radiation terms are the outstanding ones in (4) and (5). The numerical value of the electric and magnetic intensities in such a case is therefore given by

$$E = H = \frac{M_0 \omega^2 \sin\omega\left(t - \frac{r}{c}\right) \sin\omega\left(t - \frac{r}{c}\right)}{c^2 r} \qquad (6)$$

Since $\frac{c}{\omega}$ is equal to $\frac{\lambda}{2\pi}$, where λ is the wave-length of the electromagnetic disturbance, we see that when the distance r is large compared with $\frac{\lambda}{2\pi}$ the electric wave consists of periodic electric and magnetic forces at right angles and in phase. The intensities of these forces vary inversely as the distance from the source.

For points sufficiently distant, the varying electric doublet may be considered as being produced by a fixed electric charge e at the origin, about which vibrates an equal and opposite charge along the Z axis. In this case M_0 is equal to ez_0 where z_0 is the amplitude of the vibrating charge. Since, also, such a vibrating charge may be considered as equivalent to an alternating current element of current amplitude i_0 and length ds, where $ez_0\omega = i_0 ds$, we have

$$M_0 = ez_0 = \frac{i_0 ds}{\omega}, \qquad (7)$$

so that, so far as maximum values of the periodic forces are concerned, (6) may be written

$$E = H = \frac{\omega i_0 ds}{c^2 r} = \frac{2\pi i_0 ds}{\lambda r c}. \qquad (8)$$

In practice the element ds is represented by the vertical portion of an exposed electrical conductor called the aerial through which an alternating current of amplitude i_0 and angular frequency λ flows. We see from (8) that the higher the aerial and the greater the frequency the greater are the electric and magnetic forces produced at a distant point. In practical units (8) may be written as

$$E = \frac{60\pi i_a h_a}{r\lambda} \text{ volts per metre,} \qquad (9)$$

where i_a is the amplitude of the aerial current in amperes, h_a is the "effective height" of the aerial in metres and r and λ are also expressed in metres. This is the fundamental formula of wireless transmission. For its practical application it is usual to recognize the fact that the aerial is erected above the conducting ground so that, as a result of the electrical image of the aerial in the ground, the electric force is doubled at all points. This way (9) becomes

$$E = \frac{377 i_a h_a}{r\lambda} \text{ volts per metre,} \qquad (10)$$

the practical transmission formula.

The aerial assembly approximating most closely to the case of a vertical element through which the current is uniform consists of a vertical wire aerial with a long flat top in which the capacity of the system may be considered to be concentrated. Such a system is represented diagrammatically in figure 2 where an inductance L is included to make the system oscillatory. The introduction of such an inductance was first proposed by O. Lodge in Patent specification No. 11575, 1897 as a method of reducing the decrement of damped electrical vibrations in a system, and also as a convenient method for adjusting the natural frequency of the circuit. For transmission the circuit is energized by an oscillation generator G which may be either a thermionic valve generator of sustained oscillations or a spark generator of damped electrical vibrations. To produce maximum current in the aerial system the natural oscillation frequency of the circuit should be equal to that of the oscillation generator. In practice the current throughout the entire vertical portion AB of the aerial (known as the "lead-in") is nearly constant, but, in the horizontal portion BC, the strength of the current and the potential relative to that of the earth vary from point. The inductance, capacity and resistance of the horizontal portion are, in fact, distributed throughout its length and the effective inductance, capacity and resistance of the whole will depend on the frequency of the oscillations. This case has been examined in some detail by J. M. Miller. Let R_1, L_1 and C_1 be the resistance, inductance and capacity per unit length of the horizontal portion of the aerial. The most important problem is to determine the constants of a simple circuit, such as is shown in fig. 3, which consists of the added or loading inductance L with its resistance R together with lumped resistance R_e, inductance L_e and capacity C_e, and which is equivalent to the aerial system. (Since the current through the lead-in is uniform, its inductance and resistance may be considered included in L and R.) The quantities L_e and C_e are defined as those which will give the same resonant frequency as the antenna system in fig. 2, while further, the quantities R_e, L_e and C_e must be such that the current in the two circuits, aerial and its equivalent, should have the same maximum value for the same applied electromotive force whether the electromotive force is damped or undamped. The expressions for R_e, L_e and C_e, in terms of R_1, L_1 and C_1, are, in general, complicated, but for frequencies which are low compared with the natural frequency of the antenna without the added inductance, we have

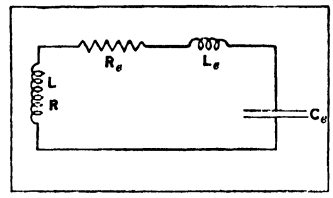

FIG. 3

$$R_e = \frac{lR_1}{3} = \frac{R_0}{3},$$

$$L_e = \frac{lL_1}{3} = \frac{L_0}{3},$$

$$C_0 = lC_1 = C_0$$

where l is the length of the horizontal portion. The natural frequency f of the aerial, when loaded, is therefore given to a fair degree of accuracy by

$$f = \frac{10^6}{2\pi\sqrt{\left[\left(L + \frac{L_0}{3}\right) C_0\right]}}$$

and the wavelength λ, in metres, by

$$\lambda = 1884\sqrt{\left[\left(L + \frac{L_0}{3}\right) C_0\right]}$$

where the inductances are expressed in microhenries and the capacity in microfarads.

The wires of an antenna offer resistance to the current passing through it which is greater for high frequency currents than it is for steady currents because of the skin effect. In addition to this, the radiation of energy in the form of waves may be regarded as causing an increase in the apparent resistance. This increase in the resistance is known as the radiation resistance, which may be defined as that resistance which, if inserted in the vertical portion of the antenna, would cause as great a dissipation of energy as the energy radiated in waves. Its value may be shown to be

$$\frac{1580 h_a^2}{\lambda^2} \text{ ohms}$$

(h_a and λ being in the same units) for such a flat-topped aerial as we are considering and must be added to R_e together with the resistance of the coil L and the lead-in to give the total resistance of the aerial circuit.

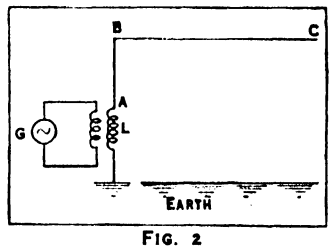

FIG. 2

Electric waves sent out from a transmitting system such as is shown in figure 2 produce a vertical electromotive force in a vertical wire at any point equal to Eh_r volts where h_r is the effective height of this vertical wire in metres and E is the electric field produced by the sending system as given by the fundamental transmission formula (10). The vertical wire may be made the aerial of the receiving system and tuned by means of an inductance to the frequency of the incoming waves. At resonance therefore, since Ohm's law holds, the current i_r in the receiving aerial system is given by

$$i_r = \frac{h_r E}{R_r} = \frac{377 h_r h_s i_s}{\lambda_r R_r} \qquad (11)$$

where R_r is the effective resistance of the receiving aerial. The received signal current is not detected in practice as a current in the receiving aerial, but as an electromotive force of maximum amplitude $2\pi f L^1 i_r$ between the ends of the tuning inductance L^1 in the receiving circuit. (*See* fig. 4a.) In modern practice the points A and B are connected to the input terminals of a thermionic valve amplifier which is a potential-operated device. After amplification the oscillatory potential is applied to some conductors (*e.g.*, crystal or valve detector) for which the relation between current and potential is not linear. The ultimate effect of the received signal oscillation is, therefore, a direct current through a crystal or through the anode circuit of a thermionic valve to which a telephone or galvanometer is arranged to respond.

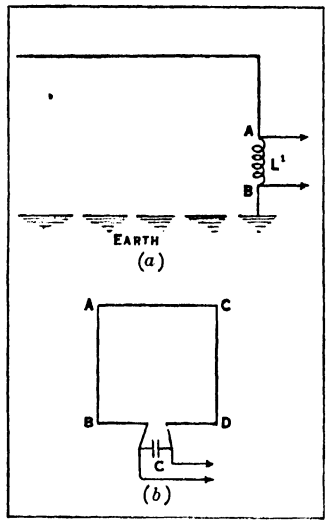

FIG. 4.—(A) RECEIVING ANTENNA. (B) RECEIVING COIL AERIAL

The receiving system need not be an open antenna; it may be a closed coil as illustrated in fig. 4b. In such a case, due to the slight difference in the phases of the electromotive forces introduced in the two vertical limbs (AB and CD) of the coil by the travelling waves a resultant electromotive force E_r, given by

$$E_r = \frac{2368 A N i_s h_s}{\lambda^2 r}$$

is introduced into the system, which, at resonance, produces an oscillatory current of value i_r where

$$i_r = \frac{2368 A N i_s h_s}{\lambda^2 r R}, \qquad (12)$$

R being the total effective resistance of the oscillatory circuit and N the number of turns of area A in the coil. When a closed coil is so used the tuning is usually performed by means of a condenser C and the signal detected as the oscillatory potential, of maximum amplitude $\frac{i_r}{2\pi f C}$ which is produced across its terminals. Although the frame aerial is not as efficient a collector of electric wave energy as an open antenna of comparable dimensions it possesses the valuable property of directivity in reception, in that waves travelling in a direction at right angles to the axis of the coil produce the maximum signal intensity whereas waves travelling in the direction of its axis produce no signal at all.

For the conveyance of intelligence by means of electric waves the amplitude of the transmitted wave is caused to vary. In the sending of Morse signals the amplitude is zero during a pause between signals (spacing interval) and a certain definite value during a signal dot or dash (marking interval), though, in certain systems, two different wave-lengths are emitted during the marking and spacing intervals while the receiver is tuned so as to receive only the marking wave-length. For the transmission of telephony the signal impulses from the microphone are amplified and caused to control the amplitude of the generator G in fig. 2. The result of the periodic variation of the emitted amplitude at a speech frequency is the simultaneous emission of two frequencies other than the normal frequency of emission. For example, if the angular frequency of the fundamental radio-frequency is ω, and that of the speech or modulation frequency is ρ, the signal amplitude may be represented by an expression such as

$$E(1 - b\sin\rho t)\sin\omega t,$$

where E and b are constants and t is the time. This expression is equal to $E\sin\rho t + Eb\cos(\omega+p)t - Eb\cos(\omega-p)t$. The station therefore emits the mean frequency $\frac{\omega}{2\pi}$ and the two "side-band" frequencies $\frac{\omega+p}{2\pi}$ and $\frac{\omega-p}{2\pi}$. The receiving assembly must therefore be sufficiently broadly tuned to permit of the reception of these side-bands as well as the mean frequency.

THE PROPAGATION OF WAVES

In approaching the somewhat complicated facts of signal transmission, it is of great assistance to bear in mind certain broadly-defined distinctions. In the first place transmission over distances small enough for the earth to be considered plane should be distinguished from transmission over longer distances where the curvature of the earth has to be taken into account. Secondly it should be recognized that the results obtained with short waves (*e.g.*, of wave-length less than 200 metres) are usually quite different from the results obtained with longer waves; and, thirdly, that the results for day and night conditions are often very different, especially in the case of short waves.

SHORT-DISTANCE TRANSMISSION

From measurements of the electric field strength due to a wireless sender of known aerial current, effective height and wave-length it has been possible to compare the observed values of field strength with those to be expected from the fundamental transmission formula (10). The first measurements of this type were made by W. Duddell and J. E. Taylor, who, in 1905, examined the relation between signal intensity and distance for overland and oversea conditions, using a wave-length of about 200 metres. Spark transmission was used and the current in the receiving aerial was measured by a thermogalvanometer. For oversea transmission the product of received signal current and distance was found to be constant, indicating agreement with the simple transmission formula, but for overland transmission the same product was found to fall in value with increase of distance. Since the observations were made at distances sufficiently small for the departure of the earth's surface from a plane to be inappreciable this discrepancy for overland transmission has been attributed to the dissipative influence of the ground.

A theoretical discussion of the propagation of plane waves over a plane surface of finite conductivity was published by J. Zenneck in 1907. The attenuation coefficient of the waves was shown to be inversely proportional to the square of the wave-length, so that the dissipative effect of the ground is most marked for short waves. The resistivity of the ground was also shown to introduce a forward tilting of the wave-front and a difference of phase in the horizontal and vertical electric fields in the air or in the earth. The complete problem of transmission over a plane surface of finite conductivity from an emitting source situated on the surface was examined by A. Sommerfeld in 1909, while a comparison of experimental results with his theory was made by J. A. Ratcliffe and M. A. F. Barnett, who, in 1927, measured the variation of signal strength with distance for the Daventry 1,600 metre wave-length transmitter. Satisfactory agreement with Sommerfeld's theory was obtained if the average conductivity of the ground was taken to be about 10^8 e.s.u., a value of the same order as that previously obtained by R. L. Smith-Rose and R. H. Barfield from measurements of the forward tilt of the electric force of waves travelling along the ground. A complete survey of the signal intensities received at different points round the London

(2LO) transmitter on a wave-length of 365 metres led R. H. Barfield to attribute the variation of signal attenuation with direction to the effect of trees, a marked attenuation being found when the waves traversed well-wooded areas.

The above-mentioned observations were made during daylight hours when steady and consistent signal intensities are recorded. At night-time at the longer distances, and particularly with the shorter wave-lengths the signals vary in an erratic manner. Such signal variation is known as fading. For wave-lengths within the broadcasting band (200–500 metres) these nocturnal variations are detectable at distances as short as 10 miles from the sender. As the distance is increased the signal variations become more marked, so that at a distance of 100 to 150 miles the intensity may vary from zero to a value twice the day-time value. At still greater distances where the day-time signal is very weak the chief effect of the withdrawal of sunlight is a marked increase of signal intensity which, though suffering considerable variation, does not frequently fall to zero as is the case at slightly shorter distances.

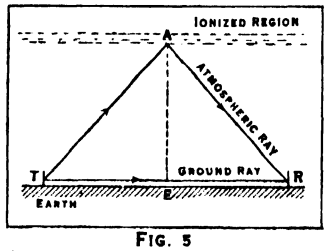

FIG. 5

Nocturnal signal variations have been shown to be due to waves of variable intensity and phase which arrive at the receiving station after being "reflected" by a layer of free electricity which exists in the upper atmosphere. The existence of this layer, which plays an all-important part in long-distance propagation, was first postulated by O. Heaviside and A. E. Kennelly in 1902 to account for the propagation of waves round the protuberance of the earth's surface. Its existence was proved by direct experiments carried out by E. V. Appleton and M. A. F. Barnett in England, and by G. Breit and M. Tuve in America in 1925. The principles of both experiments may be illustrated by means of fig. 5 in which a transmitter T is communicating to a receiving station at R by sending out continuous waves. Two sets of waves reach the receiver R, one set by the direct path TR along the ground and the other via the upper atmosphere by way of TAR. For simplicity it is assumed that the atmospheric waves are truly reflected by the Kennelly-Heaviside layer. Suppose the difference in path between the paths of the ground and atmospheric waves is D. We then have

$$n = \frac{D}{\lambda}, \qquad (13)$$

where n is the number of wave-lengths the atmospheric ray, because of its longer path, arrives behind the ground ray at the receiver R. In the experiments carried out by Appleton and Barnett the wave-length of the transmitting station was slowly and continuously varied through a small range $\delta\lambda$ and the resulting signal maxima and minima due to the variation in n recorded. From (13) we have numerically

$$\lambda^2 \frac{\delta n}{\delta \lambda} = D, \qquad (14)$$

so that if the number of signal maxima δn for a given wave-length change $\delta\lambda$ is found D may be calculated. From D the height of the layer AE may be deduced by simple triangulation. This height, for a wave-length of 400 metres, is normally found to be of the order of 100 km.

In the experiments of Breit and Tuve very short impulses of radio frequency energy were sent out from T, and as each impulse is received twice at R, first via the ground and secondly via the atmosphere, it is possible, from an oscillographic registration of the signals, to measure the difference in the times taken for the waves to traverse these two paths. Knowing the velocity c of electromagnetic radiation in free space it is therefore possible to find the difference in length of the two paths and thus find the height at which the atmospheric waves are deviated. Using 70 metre waves Breit and Tuve found heights varying from 90 km. to 230 km.

Variations in the effective height of the layer between night and day were found by Appleton and Barnett, confirming the view that the ionization in the upper atmosphere is due to solar influence. During the day the lower boundary of the layer is low and fairly-well defined. After sunset the withdrawal of the sun's rays cause the under-boundary to rise, due to recombination of ions in the lower regions. The slow rise continues until, about an hour before sunrise, the layer falls rapidly and resumes its day-time value.

To understand the difference in intensity of the down-coming rays between day and night it is necessary to examine the process by which the atmospheric waves are deviated by the upper atmosphere. For very long waves it is most likely that the gradient of ionization at the lower boundary of the layer is sufficiently large to cause a marked change of conductivity or dielectric constant within a wave-length, so that for such wave-length true reflection takes place. For the shorter wave-lengths it is usually accepted that the process of deviation is brought about by a gradual bending of the waves due to a gradual reduction of refractive index with height. The theory of this process has been examined by W. H. Eccles and J. Larmor. According to Larmor, electrons, with long mean free paths, are the effective agencies in the reduction of the refractive index. For N electrons per cc, of mass m and charge e, the refractive index is given by

$$\mu^2 = 1 - \frac{Ne^2}{\pi m c^2}\lambda^2. \qquad (15)$$

We may thus picture the atmospheric ray trajectory as in figure 6 where the ray impinges on the layer at B at an angle of incidence θ_0. The reduction in the refractive index causes the ray to bend away from the normal so that it follows the track BAC. Such considerations raise the question as to what is actually measured in the direct methods of measuring the "height" of the layer as developed by Appleton and Barnett and by Breit and Tuve. A detailed consideration of the problem shows that in both cases the height FE in fig. 6 is measured. Thus the height is the same as would be deduced from measurement of the angle of incidence of down-coming waves received at the ground such as have been made by Appleton and Barnett and by R. L. Smith-Rose and R. H. Barfield. In all cases the height measured is greater than the actual maximum height AE of the atmospheric ray path.

The bending of the atmospheric waves is accompanied by absorption since the electrons in the layer, vibrating under the influence of the electric forces in the waves, are subjected to collisions by the gas molecules to which they communicate energy. The attenuation coefficient is greater the greater the pressure of the air at the point in question, and, other things being equal, is proportional to the square of the wave-length. Thus theoretical considerations suggest that a high layer and use of short waves provide the conditions most suitable for communicating over long distances.

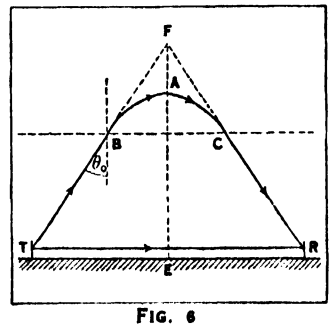

FIG. 6

The different types of fading experienced at different distances may now be explained. During the day-time, for wave-lengths of 400 metres, such as are used in broadcasting, the down-coming waves are weak at all distances, but are much increased in strength at night. At short distances (*e.g.*, 50 miles) a strong ground signal is received which is the same by day and by night. At greater distances (*e.g.*, 100 to 150 miles), although a steady ground signal is received during the day the signal at night is composed of ground waves and atmospheric waves of about equal intensity. As the down-coming waves vary both in intensity and phase, variations of the resultant signal from zero to twice the day-time value take place, corresponding to out-phase and in-phase conditions of the two sets of waves. At still greater distances the day-time signal

due to the ground waves is very weak so that at night the signal is almost wholly due to the down-coming waves. At this distance, therefore, although the signals vary a good deal, it is not often that they disappear entirely.

The critical region at which ground and atmospheric waves are approximately equal in intensity varies with the wave-length used. For longer waves of 1,600 metres, for which the ground waves are much less attenuated, this region is about 300 to 400 miles from the transmitter at night, while for shorter waves of 100 metres it may be only 10 miles distant.

Directional Reception.—As mentioned above, the use of a single coil or frame aerial as the receiving aerial permits of directional reception. The same device may therefore be used to find the direction in which waves are arriving at a receiving station, as was first pointed out by R. A. Fessenden in 1899. It is found in practice that the most convenient way of finding the direction in which waves are arriving is to rotate the loop until signals of minimum intensity are received. The axis of the loop then coincides with the direction of arrival of the waves. Other systems of direction finding such as the Bellini-Tosi system and the Robinson system operate on essentially the same principles for, in each case, the observation of apparent direction is carried out by setting some part of the rotating system, which revolves about a vertical axis, in a position in which the signal electromotive force is zero or, at the least, a minimum.

Although such systems, for medium and long wave-lengths, are found to give correct bearings during the day-time, the readings during the night are often liable to errors of as much as 90°. The signal minima are found to be blurred, displaced and variable while at the same time fading often occurs. Such nocturnal errors begin to make their appearance at distances of 30 miles from the transmitter for overland transmission and at 100 miles for oversea transmission. With increasing distance the magnitude of these effects at first increases but finally decreases, so that at long distances direction-finders give correct bearings.

An explanation of these vagaries was put forward by T. L. Eckersley in 1921 who suggested that the effects were due to the arrival at the receiver of down-coming waves from the ionized layer which were polarized so as to possess a component of electric force at right angles to the plane of propagation (*i.e.*, to the vertical plane containing the transmitting and receiving stations). As the effects are usually observed at distances at which the ground waves from the sending station are of appreciable intensity the problem is complicated by the fact that an interference system is produced between ground and atmospheric waves. The relevant details are illustrated in fig. 7, which is drawn in the plane of propagation.

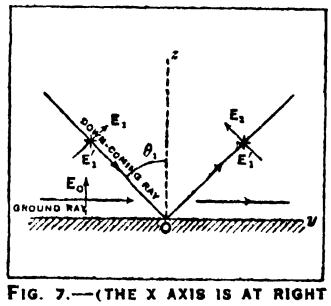

FIG. 7.—(THE X AXIS IS AT RIGHT ANGLES TO THE PAPER)

Let O be the site of the receiving station at which a ground wave (electric and magnetic vectors E_0 and H_0 respectively) and a down-coming wave, incident at angle θ_1, are received. The down-coming wave may be resolved into two components, one (E_1,H_1) with electric vector in the plane of propagation, and the other (E_1',H_1') with electric vector perpendicular to this plane. Following Eckersley these may be termed the normally and abnormally polarised components respectively. Assuming, as a simplification, that the ground approximates to a perfect conductor (which is sufficiently accurate for wave-lengths greater than about 300 metres) the electric and magnetic forces at O may be written

$$\begin{aligned} &E_x=0,\ H_x=H_0\sin\omega t+2H_1\sin(\omega t+\theta),\\ &E_y=0,\ H_y=2H_1'\cos\theta_1\sin(\omega t+\theta'),\\ &E_z=E_0\sin\omega t+2E_1\sin\theta_1\sin(\omega t+\theta),\ \ H_z=0 \end{aligned} \qquad (16)$$

where ω is the angular frequency of the waves and θ and θ' the phase differences between the ground wave and the normal and abnormal components of the down-coming wave respectively. The electromotive force induced in the coil when in the maximum position is proportional to H_x, and when in the minimum position to H_y. If the down-coming waves were normally polarized H_y would be zero and there would be no error.

The order of magnitude of the maximum error which might be experienced in any case may be found by taking the case in which E_0 and E_1' are in phase, and E_0 and E_1 are out of phase. The angular error ϕ in this case is given by

$$\tan\phi=\frac{2H_1'\cos\theta_1}{H_0-2H_1} \qquad (17)$$

As it is probable that H_1 and H_1' are of the same order of magnitude we see that, when the error is small, its magnitude depends on the ratio of the atmospheric and ground ray intensities and on the angle of incidence of the down-coming waves. When a strong ground wave is received the error will be small, so that the difference between the attenuation of ground waves overland and oversea is reflected in the different ranges at which errors become appreciable. Also the error is small at large distances when θ_1 approaches 90°.

It is possible to account for this abnormality in polarization in terms of the magneto-ionic theory proposed by E. V. Appleton in 1924, and independently by H. W. Nichols and J. Schelleng in 1925, in which the effect of the earth's magnetic field on wireless propagation is taken into account. According to this theory, if the electrical carriers in the upper atmosphere are of electronic mass, the formula (15) for the refractive index of the ionized layer is only valid for very short waves. A detailed examination of the problem shows that under the action of the earth's magnetic field, the upper atmosphere acts as a doubly refracting medium in that a linearly polarised wave entering it is split up, in general, into two elliptically polarized components of different absorption and refrangibility. Due principally to the difference in the absorption experienced by the two components in the lower region of the ionized layer the wave which ultimately emerges from the layer is chiefly composed of one of the components, and is thus, in general, elliptically polarized.

LONG-DISTANCE TRANSMISSION

1. **Long Waves.**—In December 1901 G. Marconi established communication over a distance greater than 2,000 miles between Poldhu (England) and St. John (Newfoundland), while the first quantitative relations between signal intensity, distance of transmission and wave-length were given by L. W. Austin, whose experiments, begun in 1910, have been continued since. As a result of transmissions carried out between Brant-Rock and Arlington on the east coast of America and various American cruisers, Austin was led to the empirical formula

$$E=\frac{377i_sh_s}{r\lambda}e^{-(0\cdot0016r/\sqrt{\lambda})} \qquad (18)$$

for the electric force at a distance r from the transmitter. It will be seen that this formula, known as the Austin transmission formula, is similar to (10) but that an exponential term, known as the "absorption term," has been included. Austin's formula was based on day-time measurements at distances up to 2,000 kilometres. Its applicability up to distances of 4,000 km. was later verified by J. L. Hogan. In the "absorption term" both and λ are measured in kilometres.

L. F. Fuller, as the result of a series of measurements made between Honolulu and San Francisco, a distance of 3,880 km. with wave-lengths ranging from 3,000 to 11,800 metres, proposed for day-time transmission the formula

$$E=\frac{377i_sh_s}{r\lambda}\sqrt{\frac{\theta}{\sin\theta}}\,e^{-(0\cdot0045r/\lambda^{1\cdot4})}. \qquad (19)$$

In this formula the absorption term is seen to be different from that proposed by Austin, while there is also introduced a term $\sqrt{\frac{\theta}{\sin\theta}}$, where θ is the geo-centric angle between sending and receiving stations. This latter term is introduced to allow for the fact that the earth's surface is spherical and therefore the

energy flux at a distance r measured along the surface of the earth is proportional to $\frac{\theta}{r^2\sin\theta}$ and not to $\frac{1}{r^2}$. Its inclusion amounts to a correction of 1% at a distance of 2,000 km. to a correction of 25% at 10,000 km.

Numerous field-strength measurements carried out in 1922 by engineers of the American Telegraph and Telephone Company and the Western Electric Company, in connection with tests preparatory to the inauguration of the trans-Atlantic wireless telephone service, suggested for day-time conditions an absorption term $e^{-(0\cdot005r/\lambda^{1\cdot25})}$ in the transmission formula instead of those proposed by Austin and Fuller. At night signal intensities, though erratic, were often high, sometimes reaching the value given by (10) (*i.e.*, [18] or [19] without the absorption term).

The theoretical problem corresponding to the case of propagation over such large distances as we are considering is that of the diffraction of waves round a conducting sphere. The ideal case of a perfectly conducting sphere surrounded by an infinite non-conducting dielectric was examined by H. M. Macdonald, Lord Rayleigh, H. Poincaré, J. W. Nicholson, H. March, W. V. Rybeynski and G. N. Watson. The general result of these investigations is that the signal intensities observed in practice are too large to be explained by diffractive bending alone, and it was this discrepancy which led, in the first place, to the postulation of a reflecting layer. The case in which a reflecting layer influences transmission has been examined quantitatively by G. N. Watson, whose formula, together with that obtained by the same writer for simple diffraction, are given below.

Diffraction Formula

$$E = \frac{0\cdot5365\, i_a h_a e^{-2\cdot39(\theta/\lambda^{\frac{1}{3}})}}{\lambda^{\frac{1}{2}}(\sin\theta)^{\frac{1}{2}}} \qquad (20)$$

Reflection Formula

$$E = \frac{A\, h_a i_a e^{-(\alpha r/\sqrt{\lambda})}}{\lambda(R\sin\theta)^{\frac{1}{2}}} \qquad (21)$$

where R is the radius of the earth, and

$$\alpha = \frac{1}{2H}\left\{\left(\frac{\rho_1}{2c}\right)^{\frac{1}{2}} + \left(\frac{\rho_2}{2c}\right)^{\frac{1}{2}}\right\}$$

where ρ_1 = resistivity of reflecting layer,
ρ_2 = resistivity of the earth,
H = height of the layer above the earth, and A is a constant.

A very complete discussion of the comparison of signal strength measurements with both of these formulae has been given by H. J. Round, T. L. Eckersley, K. Tremellen and F. C. Lunnon using measurements made by Marconi Company Engineers during 1922 and 1923 on an expedition sent to Australia. At smaller distances using (20) the agreement is fair, but at distances greater than 2,000 km. diffraction alone is wholly inadequate to explain the results. The same authors consider that for long waves (*e.g.*, 16,000 metres) the effects of reflection begin to be important at distances of about 700 km. and at distances greater than 2,000 km. the second formula of Watson (21) becomes applicable. They therefore put this in a practical form as

$$E = \frac{377\, i_a h_a e^{-(\alpha r/\lambda^{\frac{1}{3}})}}{\lambda(d_0 R\sin\theta)^{\frac{1}{2}}} \qquad (22)$$

which is easily seen to resemble the empirical formula of Austin very closely. In (22) d_0 is a constant having the dimensions of a length and which theoretically is equal to $\frac{3}{2}$ H.

The results of the Australian expedition show that during the day-time the absorption factor α is independent of the wave-length, but that it appears to vary with the direction of transmission. For example in trans-Atlantic measurements the attenuation in a West to East direction is lower than that in the opposite direction. Examples of the simultaneous reception of signals both ways round the earth were noted. The reception of abnormally large signal intensities at the Antipodes, found by Lieut. Guierre on the S.S. Aldebaran in 1920, was also confirmed.

Some mean values of the attenuation coefficient for various types of transmission are given below

European Stations received in the Atlantic	$\alpha = 0\cdot0018$
American Stations received in the Atlantic	$\alpha = 0\cdot00142$
European Stations received in the Pacific	$\alpha = 0\cdot00095$

(2) **Medium Waves.**—Measurements across the Atlantic Ocean were made in 1923 by H. D. Arnold and L. Espenschied on a wave-length of 300 metres. Agreement with Austin's empirical formula was obtained during the day, but during the night, values agreeing with the simple formula (10) obtained by neglecting the absorption term in Austin's formula were obtained.

(3) **Short Waves.**—The wave-length used by H. Hertz in his original experiments was about 3 metres. The engineers who developed Hertz's discovery, foremost among whom was G. Marconi, found that longer wave-lengths gave greater ranges, and from 1895 onwards it was considered that the long waves were more suitable for long distance communication than short waves. Both during and after the World War of 1914–1918, however, more attention was paid to the short wave-lengths. The evolution of the thermionic valve had provided the radio-engineer with new tools for both transmission and reception. With it the generation of continuous waves down to wave-lengths of a few metres was a simple matter while, at the same time, its inclusion in wireless receiving sets as amplifier and detector had increased the sensitivity of such receivers many thousandfold. About the same time wireless amateurs both in England and America and also the engineers of the Marconi Company began to explore the use of short waves for long distance communication. Three main conclusions were drawn from the amateur and professional experiments. The first was that short waves travelled exceedingly long distances with very small attenuation, so that comparatively low-power stations were required to produce readable signals at the Antipodes. This characteristic of short waves could not have been predicted from the Austin formula and from our previous knowledge of the behaviour of long waves. Secondly it was found that, although the signal strength first fell off rapidly as the distance from a short-wave station was increased, the signals suddenly appeared in greater strength when a certain critical distance was reached, and only died out gradually as the distance was increased further. The critical distance at which the strong signal suddenly appeared, the so-called "skipped distance" was found to vary with wave-length, being greater the shorter the wave-length. For example for a wave-length of 30 metres the skipped distance was found to be about 600 km. but for 20 metre waves it was about 1,400 km. The third characteristic of short-wave transmission was that there often appeared to be two *optimum* wave-lengths, one most suitable for day transmission and the other for transmission by night, so that, by the use of both, communication over the whole of the day could be maintained.

An explanation of the "skipped distance" observed in short wave was first given by A. H. Taylor and E. O. Hulbert, who, in 1926, pointed out that according to (15) and for a constant value of the electron concentration in the upper atmosphere the reduction in the refractive index and thus the maximum angle through which waves may be deviated becomes smaller the smaller the wave-length. It was therefore suggested that the ray received at the edge of the skipped distance was critical in that it had been deviated at the level in the upper atmosphere where the electron concentration was greatest, and that waves meeting the layer with smaller angles of incidence than this critical ray actually penetrated the layer and escaped. This is tantamount to saying that there are no atmospheric waves of normal type received within the skipped distance because there is insufficient electricity in the layer to bend them back. It has, however, been found that it is possible to receive a very weak signal within the skipped distance which, since its intensity is found to vary considerably, must be attributed to down-coming waves. Such signals appear to come from all directions in that they show no directional effects and this has led T. L. Eckersley to suggest that the radiation responsible for these signals is scattered from the waves which are passing overhead and which are bent back

to the ground at greater distances.

The use of methods of concentrating radiation into a beam has been developed by the Marconi Company Engineers, and particularly by C. S. Franklin who has, after experimenting with parabolic reflectors after the manner of H. Hertz, designed an aerial consisting of a number of parallel vertical wires equally spaced behind which is a "reflecting screen" formed similarly of vertical wires. Such aerials are used in the series of wireless links between Great Britain and the Dominions which have been erected by the Marconi Company for the British Post Office. The use of similar aerial systems with reflectors for the receiving stations has two advantages. In the first place the use of many aerials brings about the collection of electric wave energy from over a fairly wide area thus increasing the received signal. Secondly the reflector acts as a kind of shield and protects the aerial from undesired signals and atmospherics coming in the opposite direction.

Since the attenuation of short wave signals is so low there is not a very great difference in the intensity of signals received both ways round the earth. In the case of 16-metre signals sent from America to Germany, E. Quäck has recorded oscillographically double signals with a spacing of 0·096 seconds. The first signal received was that travelling by the shorter journey across the Atlantic Ocean, while the second was that taking the long path via the Pacific Ocean. The same author has recorded instances of the fourfold reception of the same short wave signal, the first signal arriving via the direct path and being followed by signals that have travelled once, twice and thrice round the globe.

WIRELESS WAVE PROPAGATION AND SOLAR ACTIVITY

It has been shown by L. W. Austin that there exists a direct correlation between solar activity and the strength of long-wave wireless signals when averaged over long periods. On the other hand, G. W. Pickard, making signal strength observations on shorter wave-lengths, has found an inverse relationship between signal strength and sun-spot numbers. Moreover it is found that isolated magnetic storms yield evidence of a similar character for, on such occasions, although there have been exceptional cases, the general rule is that short-wave signals are weaker and long wave signals stronger in times of enhanced magnetic activity. As shown above, the general evidence suggests that long waves are reflected by the lowest of the ionized regions in the upper atmosphere, while short waves, which require a greater electronic density to bend them back, travel through these lower regions before being appreciably deviated. If, therefore, the effect of enhanced solar activity were to increase the ionization in the lower layers of the atmosphere there would result an increase in the intensity of the waves reflected from its surface and an increase in the absorption of waves passing through it. The variation in signal intensity found by Austin during the 11-year sun-spot cycle can be explained by assuming that the specific conductivity of the layer reflecting the long waves used is 1·5 times as great at sun-spot maximum as at sun-spot minimum. This figure is in agreement with the evidence of terrestrial magnetism.

COMMUNICATION

General Considerations.—Communication by Hertzian waves is the only practical method of transmitting messages beyond the horizon to recipients whose position is not known or whose position is continually changing. Hence wireless telegraphy and telephony have no rivals for the purpose of communicating with distant ships, aeroplanes, surveyors and explorers. Again, it is characteristic of wireless or radio communication that its waves tend to spread equally in all directions, and thus the messages can be made available to all who possess the necessary receiving apparatus. Examples of this quality are seen in the modern art of radio broadcasting and in the wireless call for help of a ship in distress. Here again, wireless has no competitor.

On the other hand wireless can give many of the services that have hitherto been rendered by land lines and submarine cables. Thus, in transatlantic telegraphy, wireless has been competing with the ocean cables for about twenty years with gradually increasing success. In some cases, especially in respect of long distances such as England to Australia, New York and Berlin to South America, the competition of radio with the cable has become very acute during the past three years because the erection of the necessary wireless stations requires only an insignificant capital outlay compared with that necessary for, say, ten thousand miles of submarine cable. These same considerations of cost often decide whether wireless or cable communication is to be chosen for linking a small island community with the rest of the world.

Wireless communications can be said to comprise every variety of traffic that can be handled by aid of wires. For instance, besides the transmission of Morse signals and of music or speech, wireless stations have been utilized for the transmission of pictures, of signatures, of facsimiles of printed pages and for television. In many cases, the rapidity of wireless transmission to any distance is as rapid as that possible over a few hundred miles of land line, and much faster than that possible through a hundred miles of submarine cable. Hence for work such as telephony, facsimile transmission and television, a wireless circuit accomplishes things

that are at present impossible on the transoceanic cables.

Wireless communication has, however, some of the defects of its qualities. Inasmuch as the emissions from a wireless station can be picked up by anyone who provides himself with suitable apparatus, there is little of that secrecy which belongs to communications which are compelled to pass along a copper wire of which the ends are in private hands. Consequently there is always a quantity of telegraphic and other traffic which preferably goes by wire. For instance, the London correspondents of foreign newspapers often refuse to transmit their news messages abroad by wireless because, if they do, the news may be printed in rival newspapers at the same moment as in their own. This defect may be overcome to some extent by coding, by very rapid transmission, or, better, by "scrambling" the messages, *i.e.*, making them unintelligible by aid of automatic mechanical devices at the transmitter, devices which can be used in the reverse sense at the authorized receiving station.

This comparison between wireless and wire will be incomplete unless the troubles that afflict both are mentioned. In the case of cables the chief source of interruption of a service is the breaking or leaking of the cable. Such an injury may take two or more weeks to repair; the only mitigation is to provide a duplicate cable or route. On all the great traffic paths of the globe such duplicates exist, and therefore it is found that the delays affect only relatively small communities. Another trouble afflicting the cable is that arising from magnetic storms; usually this averages only a few hours per annum. The principal troubles that afflict wireless communications are the breakdown of aerials in storms, the failure of machinery or power supply, "atmospherics" and "fading." The failures of a mechanical nature are often prepared against by duplicating, at least in part, the machinery. But for "atmospherics" and "fading" no real remedy has appeared as yet. Fortunately, atmospherics are much less troublesome with short waves than with long, and fading, on the other hand, is much less frequent with long waves than with short; and, therefore, in the case of an important wireless link a combination of long and short wave stations, operated from the same telegraph offices, could provide an almost continuous service. Such a combination, designed for distances of, say, four thousand miles, would probably not give quite as continuous a telegraphic service as a submarine cable and might not be any better financially.

International Regulations.—Since the emission of waves from a wireless station affects receiving apparatus over a wide area if the apparatus is attuned to the waves, it follows that every wireless station on the globe monopolizes a certain wave-length or frequency inside a certain area. Indeed, as it is impossible to tune transmitting or receiving apparatus with absolute accuracy, each station may be said to monopolize a band of frequencies. Therefore, to make telegraphic services useful, an allocation of a particular wave-length or frequency must be made to each station, due regard being taken of the area served by such station and of the proximity and needs of neighbouring stations. From this arose the necessity for international agreement and legislation, and a conference was called at Berlin in 1903, which prepared schemes for discussion at a second international conference meeting at Berlin in 1906. This conference discussed many details that had become of importance to the usefulness of wireless, including rules for handling and charging for telegrams, especially by ship's operators, and regulations for the prevention of interference and for the enforcement of penalties. At the succeeding conference in London in 1912 a radiotelegraphic convention was drawn up and was signed by nearly all the principal countries. This provided for the establishment of a central office for collecting and distributing information about the wireless services of the world, and arranged for it to take its place as a branch of the Bureau of the International Telegraph Union at Berne. This radiotelegraph office had about one thousand wireless stations on its list in 1912 and nearly twenty thousand in 1926. The growth in number is due chiefly to the increased use of wireless at sea, which was greatly stimulated by the signing in 1914 of the International Convention for the Safety of Life at Sea. This convention, which was arranged in London in 1913, specifies the minimum of equipment and staff to be carried by ships of the various grades and for the hours of service.

The most recent international radio conference took place at Washington in the autumn of 1927. The revised arrangements have not yet been ratified by all the Powers concerned, but the allocations of wave-length to different services provisionally adopted will probably be universally accepted. They are as follows:—

Long Waves

Service	Frequency kilocycles	Approximate wave-length metres
Point-to-point	Below 100	Above 3,000
Mobile and point-to-point	100–110	2,725–3,000
Mobile, including naval vessels	110–125	2,400–2,725
Mobile, merchant vessels	125–150	2,000–2,400
Mobile, calling wave	143	2,100
Mobile	150–160	1,875–2,000
Broadcasting or mobile and point-to-point (as determined by regional agreement)	160–194	1,550–1,875
Broadcasting, mobile and point-to-point services for aircraft (subject to certain limitations)	194–285	1,050–1,550
Radio beacons	285–315	950–1,050
Aviation	315–350	850–950
Mobile and radio compass	350–550	545–850
Broadcasting	550–1,500	200–545
Small vessels	1,365	220

It is proposed to allow mobile stations and point-to-point stations to share short wave bands as shown in the following table. Certain parts of the bands shown here as "point-to-point" are available for amateur stations or for short-wave broadcasting stations or are shared with mobile services. Certain parts of the bands shown here as "mobile" are similarly shared with point-to-point services.

Short Waves

Mobile service		Point-to-point service (including amateurs and short-wave broadcasting)	
Frequency kilocycles	Approximate wave-length metres	Frequency kilocycles	Approximate wave-length metres
1,500–2,750	109–200	1,715–2,250	133–175
2,850–5,700	52·7–105	2,750–5,500	54–109
6,150–6,675	45–48·8	5,700–6,150	48·8–52·7
8,200–8,900	33·7–36·6	6,675–8,200	36·6–45
11,000–11,400	26·3–27·3	8,550–11,000	27·3–35·1
12,300–13,350	22·4–24·4	11,400–12,300	24·4–26·3
16,400–17,750	16·9–18·3	12,825–16,400	18·3–23·4
21,550–23,000	13·1–13·9	17,100–21,550	13·9–17·5
..	..	22,300–23,000	13·1–13·45

Variations from this table will probably be allowed to existing important stations; all waves below 13·1 metres (above 23,000 kilocycles) remain free for allocation nationally.

The conference, among other recommendations, laid stress upon one which forbids the installation of spark sets above 300 watts input power on new ships after 1929, and the abolition of all such sets now existing on old ships on December 31, 1939. Spark stations on land will if possible be abolished by 1930, or, at latest, 1935. Moreover, all except small ships are recommended to be fitted as early as possible to receive continuous waves from 500 to 3,000 metres.

In accord with the International Convention, every important country has enacted domestic legislation to enable the international provisions to be enforced. In Great Britain and Northern Ireland the control of wireless communications is in the hands of the Postmaster General, in virtue of the Wireless Telegraphy Act of 1904, which is renewed annually. The Act provides that no one shall install or work a wireless equipment, either for sending or receiving messages, without a licence; and that when an applicant for a licence proves that his object is for experimental

purposes solely, a licence shall be granted without rent or royalty. The application of the Act to shipping is regulated under the Merchant Shipping (Wireless Telegraphy) Act, 1919, and the Rules made by the Board of Trade under this Act. (W. E.)

In the United States of America commercial wireless communication services are operated by private enterprise. Under the Act of 1927 the Federal Government has certain regulating powers to grant licences for radio stations, to license operators, to apportion wave-length assignments and other similar powers necessary to preserve the "public interest, convenience and necessity." This law is administered by an appointive group of five men known as the Federal Radio Commission. The United States was signatory to and has ratified the International Radio Convention of 1927. (X.)

Marine Communication.—The 1914 convention bound all the contracting nations to pass legislation to compel all ships that sail from one country to another to be fitted with a radiotelegraphic installation if they have on board 50 or more persons in all, subject to a few exemptions. Moreover such ships carrying more than 25 passengers must maintain a continuous watch. Every ship so fitted must carry, besides its main installation, an emergency installation of approved design. Further, the master of any ship fitted with wireless who receives a call for assistance is bound to proceed to help those in distress if requested to do so. Since 1920, the ships of the British mercantile marine have been required to engage three operators for voyages other than coastwise taking more than 48 hours from port to port when carrying 200 or more passengers. Two operators must be carried by such vessels taking between 8 and 48 hours from port to port, and regulations have also been issued relative to the carrying of wireless watchers on board in place of one or more of the certified operators.

Until about the year 1922 nearly all ship and shore communication had been conducted by spark stations transmitting on 450 and 600 metres wave-length. These signals interfered greatly with the development of the new art of broadcasting especially near great ports, and consequently much consideration was given to the introduction of more modern apparatus on ships. The larger passenger ships and shore stations gradually adopted continuous wave methods, employing either the arc or the valve, with a wave-length of about 2,000 metres. This step not only avoided interference with broadcasting but also enabled communication to be established across great distances and made multiple telegraphy possible when desired. Nowadays one and the same shore station can utilise its antenna for transmitting signals on several wave-lengths simultaneously—say 1,800, 1,900, 2,000 and 2,200 metres—thus enabling that station to work with four ships at a time without interfering appreciably with any other service, such as popular broadcasting. The tendency of development in this direction is in favour of the installation of valve transmitters rather than arcs, and with such transmitters it is possible to operate very near to broadcasting wave-lengths without causing interference. These marine valve transmitters are now being manufactured by the principal firms in many countries, usually being equipped to transmit on about 600 metres and about 2,000 metres. Inasmuch as there are still many vessels sailing with apparatus incapable of receiving continuous wave signals, the transmitters just mentioned are provided with a simple form of rapidly vibrating interrupter which chops up the continuous waves so as to yield a musical note in the receiving apparatus of the older or smaller ships.

One result of the increasing use of continuous wave transmitters at sea is that telephony is now being tried as an accessory to telegraphy. In order to transmit speech from a continuous wave plant it is necessary to modulate the waves by aid of a microphone. This modification is described in that section of BROADCASTING dealing with transmitters. The range obtained by telephony is only about a quarter of that obtained when the same plant is used for heterodyne telegraphy. In 1929, however, experiments were successfully conducted in the field of ocean telephony which enabled Atlantic liners to maintain touch with both sides of the ocean throughout almost the entire passage. It ought to be noticed that the apparatus required and installed on ships for the purpose of receiving signals—either spark signals, telephony or interrupted continuous waves, or continuous wave telegraphic signals—is almost identical with that employed by the public in receiving broadcast matter. It may consist, for example, of a three valve amplifier having one high frequency amplifying valve, one detector valve and one low frequency amplifying valve, with suitable switches for cutting out one of these stages when signals are strong enough. Such receiving apparatus is described under BROADCASTING. The only difference between the receivers there described and those required at sea is introduced for the purpose of receiving continuous wave signals by the heterodyne method. For this purpose two main alternatives exist. In the one, variously called the self-heterodyne, autodyne or endodyne apparatus, a coil in the anode circuit of the high frequency triode valve is made to act inductively upon a coil in the grid circuit of the same valve in such a way as to generate electrical oscillations within those circuits.

The frequency of these oscillations is determined by a closed tunable circuit in either the anode or the grid circuit of the valve, and is adjusted to be slightly different from the frequency of the incoming signal waves. In consequence the incoming waves "beat" with the locally generated oscillations. The frequency of the beat can be adjusted by altering the frequency of the locally generated oscillations, and can in fact be varied so as to constitute, after rectification by the detector valve, an alternating electrical current in the final circuit of the apparatus, usually the head telephones of the listening operator. The other alternative method of heterodyne reception is named separate heterodyne for the sake of distinction. In this method an entirely separate piece of apparatus consisting of a triode valve with a tunable circuit and with the anode circuit back-coupled to the grid circuit for ensuring the generation of electrical oscillations, is adjusted to generate oscillations of frequency slightly different from that of the incoming waves. This piece of apparatus, named the auxiliary oscillator, is brought near enough to the receiving apparatus to induce therein oscillations of its own frequency, which interfere with the incoming waves and finally produce in the telephones of the operator an audible note of desired frequency. The loudness of this heterodyne note can be adjusted up to a certain limit by moving the auxiliary oscillator nearer to or farther from the receiving apparatus. In both these alternative methods of heterodyne reception great magnification is obtained by the introduction of the locally generated energy.

Direction Finding.—Wireless apparatus has been developed in recent years for determining the bearing of a distant transmitting station with an accuracy of two degrees of arc at distances up to 100 miles, and with nearly equal accuracy at much greater distances, provided that the electrical conditions of the atmosphere are fairly stable. By means of the information thus obtained a mariner or aviator can navigate his vessel during foggy weather, since fog has no bad effect on wireless signals. This branch of our subject has therefore become of very great importance. Several methods are available and in active use. In one method the direction finder is situated at a land station, the bearing of the ship or aircraft from that station is measured on receipt of a wireless message from the vessel, and is transmitted to it. In another method the direction finder is on the ship and the ship's operator measures the bearing of any charted wireless shore station that happens to be transmitting or which can be requested to transmit for the purpose of the measurement. This method has also been used in aeroplanes but is being discarded. Still another method is seen in the so-called rotating "beacon," which is really a wireless transmitting station fixed on land and provided with a directional antenna that can be rotated in azimuth so as to sweep its signals round the compass as it rotates. The beacon automatically emits a characteristic Morse signal continuously and also a special signal when its directional antenna is in a standard position. An observer at a distance, equipped with ordinary receiving apparatus, hears the signal wax and wane as the directional antenna rotates. Usually the

beacon rotates through six degrees per second, and emits the special signal when an observer on the north-south line would receive minimum signals; therefore an observer off that line need only count the number of seconds that elapse between the special signal and the time when he himself perceives that the continuous signals are least audible, in order to determine his angle from the north-south line by simply multiplying by six. The easier way of performing this operation is to use a stop watch with a seconds hand which makes, like the beacon, a complete revolution in one minute. The observer starts the watch on hearing the special signal and stops it at the instant of minimum signal; the angle turned through by the seconds hand is his bearing from the beacon.

Two types of apparatus have been much used in practice in carrying out the above-described methods of finding the bearing of a ship or an aeroplane. In one form the antenna is a flat coil of several turns of wire, fixed on a vertical axis so that the plane of the coil can be pointed in any desired azimuth. Such a coil emits radiation most strongly in its own plane when used as a transmitter, *i.e.*, when strong high frequency currents are passed through it; it absorbs radiation most strongly in its own plane when used as a receiver. On the other hand substantially nothing is radiated or absorbed in the horizontal direction perpendicular to its plane. Such a coil, used as the antenna of a receiving station, can locate the direction of any distant transmitting station either by turning it until signals are strongest, when its plane must point to the station, or until signals are weakest, when it must be broadside-on to the station. The minimum is sharper than the maximum and is therefore usually used in practice in order to gain accuracy. But measuring on the minimum implies that the message cannot be read; so if reading is desired the maximum setting must be sought, or, preferably, the method designed by J. Robinson may be employed. This consists in fixing to a vertical axle two flat coils with their planes vertical and perpendicular to each other. One coil is always connected to the receiving apparatus and is pointed to absorb the maximum signal from the distant station under observation. The other coil is therefore roughly broadside to that station—roughly, because the setting of the main coil to the maximum is intrinsically an inaccurate process. To improve this setting, the auxiliary coil is switched into series with the main coil, first with its ends connected one way and then the opposite way. If the setting is perfect, the auxiliary coil neither augments nor diminishes the signal strength; but if it is imperfect one position of the switch augments, the other diminishes the signal, and the setting is altered by trial to abolish this difference.

In the type of apparatus just described the antennae are coils of wire which are small enough to be easily manipulated. In the other type, which was invented by Bellini and Tosi in 1907 and developed by H. J. Round of recent years, the antennae are also coils but they are not movable and may therefore be large structures. Two coils are necessary and they are fixed in perpendicular vertical planes; as a rule each coil has only one turn and is supported on a mast or masts. Each coil is connected to one of a pair of small fixed coils inside the station building, these coils also being in perpendicular vertical planes. Within these fixed coils a smaller coil can rotate upon a central vertical axis, and this coil is connected to the detecting apparatus. The principle underlying the invention is that waves coming from any definite azimuth excite an antenna in proportion to the cosine of the angle their path makes with the plane of that antenna; the oscillatory current thus produced in an antenna passes through the corresponding small connected coil; the oscillatory field within the crossed coils has its resultant parallel to the direction of the waves; and the rotatable search coil is swung about to determine the direction of this resultant field. The combination of the two crossed coils and the search coil within them is known as a goniometer. It has been described in the preceding lines as applied to the reception of waves; but if powerful oscillatory currents be sent from any source into the search coil these induce currents in the crossed coils and the connected antennae which produce external radiation whose resultant direction is parallel to that of the search coil. Thus a radio goniometer may be used for directional transmitting as well as for directional receiving; in fact the Bellini-Tosi invention has effectively the same properties as the single moving coil antenna already described, both for receiving and transmitting, the principal difference in receiving being that more amplification is required with the moving coil antenna because it must be small enough to be rotated quickly by hand.

In the directional apparatus so far described the radiation or absorption is symmetrical about the vertical axis of the apparatus. This fact gives rise to an ambiguity of 180° in azimuth; for instance, after finding the direction of a station the operator may still be unable to say whether it is in front or behind him unless assisted by geographical or other considerations. This ambiguity may, however, be removed electrically by adding an ordinary straight antenna and the necessary tuning equipment to the existing direction finding apparatus. It can be shown that, by adjusting the phase and magnitude of the oscillatory current produced in this single wire, the radiation or absorption, as the case may be, in one direction can be annulled and in the other increased. In other words the direction finder is made uni-directional.

Long Distance Communication.—Wireless communication across great distances has progressed greatly during the past few years. An important step was taken in 1918 by the United States army in erecting the Lafayette station at Crois d'Hins near Bordeaux for transatlantic communication. This station was more than double the strength of any predecessor and achieved world ranges with a wave-length greater than 20,000 metres; the original plant comprised two Federal-Poulsen arcs rated at 1,000 kilowatts and supplied with current at 900 volts. Somewhat smaller equipments were installed at Nauen near Berlin, at St. Assise near Paris, at Rocky Point near New York, and also in many other countries, during the succeeding four years, nearly all of them using high frequency alternators of German, French or American design. In 1922 to 1923 the British Government completed arrangements for the establishment of an Empire wireless service under which the Post Office would erect at Rugby a station capable of direct communication with all parts of the Empire, and the Dominions would erect corresponding stations. Under these arrangements the Marconi Company in 1923 planned to handle extra-Empire communications from a group of even larger stations in Wiltshire. A little later the Government plans were modified to permit of Rugby conducting this work.

Meanwhile a few American amateurs, using waves shorter than 300 metres, succeeded in communicating across the Atlantic with the expenditure of very small power in December 1921; and by December 1922, American, British and French amateurs succeeded by hundreds in similar transmissions. In the early months of 1923 amateurs telephoned from New York to California by aid of small stations using 100 metre waves, and it was becoming clear that waves less than 100 metres in length were likely to be useful in practice. This was unexpected because the very thorough pioneer work of C. S. Franklin in 1920 and 1921, published in 1922, seemed to show that waves of 15 metres length, and even of 100 metres, were only suitable for distances less than 200 miles. But the surprising results obtained by the amateurs compelled professional attention, and early in 1923 the Radio Corporation of America erected a short-wave equipment in Maine, and the Marconi Company independently installed a similar plant at Poldhu, for experimental work. The first commercial long distance message by short wave was on September 11, 1923, when a ringside account of a prize fight was sent from Maine to Buenos Aires. By the end of the year experimenters were at work all over the world to such good effect that in the spring of 1924 the Radio Corporation erected five more short-wave commercial transmitters. In July 1924 the British Government ordered from the Marconi Company a number of short-wave stations for the purpose of completing the Empire scheme of communications. These stations were to be provided with reflectors of the type developed by C. S. Franklin in order to direct the radiation mainly towards corresponding stations to be erected in Canada, Australia, South Africa and India. All these Government stations were in operation by 1928 and are considered to be the most efficient short-

wave stations extant.

The use of reflectors at both the transmitting and receiving stations ensures that the signals, under favourable conditions, are 10 to 15 times as strong as they otherwise would be. In all cases, with or without reflectors, it is necessary to provide that each station shall be capable of operation on one of two or three wave-lengths, for across long distances waves shorter than, say, 30 metres are required for daylight transmission, and longer than 30 metres for night transmission. Four years' experience with short-wave transoceanic telegraphy and telephony has shown that it may suffer erratic and lengthy periods of fading which cause loss of signals or distortion of speech and, therefore, for such work as transatlantic telephony the long-wave plant is generally more trustworthy. Best of all is the collaboration of long-wave and short-wave telephony now being practised between America and Britain (and through Rugby with large areas of Europe). On the other hand short-waves have two great advantages over long waves—they are capable of much greater telegraphic speeds and the plant they require costs less to erect and operate. The relation between short- and long-wave systems is analogous to that between motor car and railway transport; the car is for many purposes better than the railway, but it is more subject to interruption and accident; for a long time to come progressive communities will require both forms of service.

The best way of giving an idea of the present state of large scale wireless engineering is to describe some typical modern stations. The Rugby station is designed for simultaneous transmission to all parts of the Empire and to ships on any sea, and for telephony to America. Its antenna is 820 feet high and carries a current of 700 amperes at a frequency of 16·7 kilocycles (18,000 metres). It occupies a site about 1½ miles long by 1 mile wide 4 miles south-east of Rugby. The antenna is supported on 12 insulated stayed steel masts 820 feet high, a quarter of a mile apart, and has a capacity of 0·045 microfarad, but can be divided so that when the portion on 8 masts is used the capacity is 0·033 microfarad. The primary source of oscillations is a small tuning fork maintained in vibration by a triode valve by the method of Eccles and Jordan; the nine-fold harmonic of the fork current is selected, filtered and amplified by three stages of low voltage triode valves, until about 100 watts of high frequency current is obtained. This current is amplified by a bank of high voltage valves of 2 kilowatts output, then by a bank of 30 kilowatts output, and finally by a bank of 540 kilowatts output, whence the current passes to a closed circuit which is coupled to the antenna. All stages are separated by metal screens to prevent retroaction that might lead to the generation of unwanted oscillations. The last three stages are fed with a direct current high-voltage dynamo set capable of delivering up to 1,500 kilowatts at 18,000 volts. About 50 kilowatts of direct current power is consumed in heating the filaments.

All the power for the station is taken from a public electricity supply at 12,000 volts 50 cycles. The intermediate circuit between the final bank of valves and the antenna consists of two condensers in series, values 1·05 and 0·25 microfarad, and an inductance coil variable from 400 to 600 microhenries, the last being coupled to an aerial coil of 40 microhenries which has a series tuning-coil variable from 900 to 4,000 microhenries. The antenna is a continuous conductor strung across the tops of the masts, passing from each mast to the next in a flat festoon; this conductor is a cylindrical cage of eight 7/14 S.W.G. silicon bronze wires stiffened by spiders 12 feet in diameter every 140 feet. The tension is such that the pull at the top of any mast never exceeds 10 tons; if this is exceeded the steel rope holding the insulators and the antenna is paid out automatically by a slipping brake until the tension is 10 tons. The insulators will withstand a pull of 20 tons and a high frequency voltage of about a quarter million volts. The earth system is a broad band of buried copper wires running round the site under the masts and the aerial. The transmitting key is operated at the Central Telegraph Office in London. For details a paper by E. H. Shaughnessy should be consulted.

As an example of a short-wave beam station we take the Post Office station at Bodmin. This has one reflecting antenna directed to Canada, the other to South Africa. A similar station at Grimsby transmits to India and Australia. The receiving station corresponding to Bodmin is at Bridgewater, that corresponding to Grimsby is at Skegness. The transmission to Canada is on 16·57 metres by day and 32·4 metres by night; to South Africa on 16·15 and 34·01 metres respectively. The primary source of oscillations is a back coupled master oscillator of the Arco and Meissner (Telefunken) type carefully screened by heavy metal casing. The high frequency current from this (about 80 watts) is amplified by a triode valve taking 2,000 volts, and this in turn by two more valves taking 6,000 volts, and finally by two ten kilowatt water-cooled valves operated at half their rated voltage of 15,000. The high frequency current is then taken along tubular feeders to the antenna to be supplied.

Two complete outfits like the above are needed for Canada and two for South Africa in order to supply the four wave-lengths. The Canada antenna is supported on five masts, the wires in two bays being suitable for the day wave-length and those in the other two bays for the night wave-length. The masts are steel structures 287 feet high with cross arms 90 feet long. The antenna and reflector wires hang vertically from steel rope triatics joining the cross arms. In the Canada aerial there are 24 antenna wires 19 feet apart and 48 reflector wires, the distance between the antenna plane and the reflector plane being 40 feet for the shorter wave and 24 feet for the longer. The reflector wires are divided in 8 insulated portions and the antenna wires are loaded with two spaced inductances. Power for the whole station is derived from three 92 kilowatt dynamos, which supply direct current for driving motor-alternators and auxiliary machinery. The direct current for the anodes is obtained by rectifying the transformed current from the alternators. The receiving station at Bridgewater has an antenna system very like that at Bodmin, namely a line of masts broadside to Canada, a line broadside to South Africa, each line comprising two bays for the 16 metre wave and two bays for the 32 metre wave. Actually the wave-lengths received are, from Canada 16·50 and 32·13 metres, from South Africa 16·08 and 33·71 metres. It will be seen that the most original feature of the station is the unidirectional antenna due to C. S. Franklin who overcame many difficulties in carrying a great enterprise to a successful issue.

The Radio Corporation of America has installed numerous short-wave transmitters for supplementing the transoceanic work of their long-wave high power stations. Most of those in commercial use are operating without reflectors and can therefore communicate in any direction. The first two stations were erected in 1923, and five others, with wave-lengths ranging from 95 to 43 metres, in the spring of 1924. Several others, using various wave-lengths down to 14 metres followed in 1925. The Californian station may be taken as typical of modern practice. At this station the primary source of oscillations is a quartz crystal maintained in vibration by a triode valve by the same principle as is the fork at Rugby, but the frequency of mechanical vibration of the crystal is nearly 800,000 per second while that of the fork is less than 2,000. From the current in the crystal circuit is selected the triple harmonic, and this is amplified to 300 watts. The current is now passed in turn through two amplifiers and selectors of increasing size, the triple frequency being selected at each step. The total multiplication of frequency is 27 and the final frequency therefore 21 millions per second (14 metres wave-length). Finally this current is amplified again by water cooled triode valves for delivery to the antenna. The antenna is a vertical or sloping wire about 20 feet long excited through a few turns at its middle which are placed in inductive relation with the tuned circuit of the last amplifier. Even so small an antenna can radiate 10 kilowatts at this frequency.

Aviation and Wireless.—The possibilities of radio as an aid to flight are being actively developed along the following lines: (1) communication, (2) course navigation, (3) field localizing and (4) general. This last includes miscellaneous developments such as *radio altimeter devices*. *See* RADIO; AERONAUTICAL ARTICLES. *The radio directive beacon system* is a special kind of radio station usually situated just off the landing field. Instead of having the single antenna, as in the ordinary station, it has two loop antennae at an angle with each other. Each emits a set of waves which is directive, *i.e.*, stronger in one direction than another. When an aeroplane flies along the line exactly equidistant from the two beams of radio waves it receives a signal of equal intensity from the two. If the aeroplane gets off this line it receives a stronger signal from one than the other. The indicator on the instrument board shows when the signals from the two beams are received with equal intensity by means of two small vibrating reeds. The tips of the reeds are white in a dark background, so that when vibrating upon receiving signals they appear in a vertical straight line. The reed on the pilot's right is turned to a frequency of 65 cycles and the one on the left to 85 cycles. This system is to be installed on all American air routes. (X.)

WIRE MANUFACTURES. In addition to steel ropes, cables, barbed wire, nails and wire springs (*see* sections under these headings), wire is woven or shaped into an almost infinite variety of articles; the chief of these being wire-netting which is manufactured in many designs and sizes. The commonest form of wire-netting is that which is hexagonal in shape and which is woven by the twisting together of wires, this operation being carried out with a very ingenious kind of loom.

As will be seen in the illustration the hexagonal meshes are respectively formed by the twisting together of two wires, this being brought about by the passing through the loom of line wires which are unwound from bobbins and wires which are pulled out from the shuttles—these latter wires being in the form of a spiral. The spirals or springs, as they are called, are very rapidly wound on to mandrils, this being carried out by four spindles running in parallel, the wire being guided on quite evenly and automatically until the required thickness of spring has been made. The spindles on to which the wire is wrapped are slightly tapered, consequently, after the full quantity of wire required has been spun on same they can be removed from the machine and the springs easily detached or slipped off by slight end knocking.

The shuttle on the loom is in the form of a cylindrical pipe with an opening on the side at the upper end, the ends of the shuttles being fitted to what are known as split pinions. The operator charges a shuttle with one of the springs, connecting the free end of wire of the spring to the end of the wire on the netting which has just been drawn from the shuttle. The operation of twisting is carried out by a shuttle spinning round its corresponding free wire, which is shown passing up from the bobbin. Whilst the wire is being twisted the netting is at the same time carried forward by the driven rollers on top.

In this way the two wires are twisted and so form one of the sides of the hexagon mesh. After one set of twists is made the shuttles are then moved to right or left by two reciprocating horizontal beams which carry with them the half-split pinions at the top and bottom of the shuttle to join up with the half-split pinions of an adjoining shuttle. As soon as the split-pinions are fixed in their new position a toothed horizontal rack moves forward or backward as the case may be rotating the pinions and thus making the following twist on the wire. From this motion it will at once be seen that the twists on netting are alternately right-hand and left-hand.

The tension in the netting is produced by passing the netting over a series of rollers, when finally it is wound on to a friction driven spindle at the back of the loom, this being rotated at a speed which enables the netting to go through the loom at a constant velocity.

Hexagonal netting is made with all sizes of mesh from about $\frac{1}{8}$ inch up to 8 inches, the most commonly used forms being about $1\frac{1}{2}$ inches to 2 inches.

The operation of a loom which is manufacturing netting of fine mesh comes next, and it will be understood how very fine the springs have to be wound to fit into the small tubular shuttles necessary for the fine mesh.

Fine wire is also woven into netting of various designs which is used for the reinforcing of glass.

Whilst nearly all netting is manufactured from annealed black wire some is occasionally fabricated from wire which has been specially galvanized to form a coat which will not crack.

The galvanizing of black wire netting is a very important operation as this process not only coats the wire with zinc to protect it from corrosion, but also welds the wire of the respective twists tightly together. Before the netting can be galvanized it has to be pickled or cleaned in hydrochloric acid for the removal of scale, after which it is placed on a mandril at the back of the galvanizing pot, and is carefully passed through the molten zinc, being drawn out at the front of the galvanizing bath, and rolled tightly on to a tapered mandril. When a complete 50 yards roll has come through the bath it is then detached from the mandril. When it is to be used for export purposes it is usually rewound much tighter so as to form a smaller diameter roll which takes up less space in shipping.

Wire Cloth, Reinforcing Fabric and Fencing.—Fine wire in steel, copper and brass is also woven into cloth, the wires usually being at right-angles to each other and thus forming square mesh. In addition steel wire is very largely used for forming fabric of square or rectangular mesh for reinforcing purposes, either for concrete in building or road mending. Usually fabric of this description is welded together at the joints. The welding of wire for this purpose is carried out by a specially designed machine into which the line wires are mechanically fed in parallel at the required distances apart. The cross wires automatically move into the machine at the desired position relative to the line wires, being instantly pressed on to the latter. As soon as the wires are in contact an electric current passes through fusing a little of the surface of the wires which being under pressure immediately welds them together, at the same time switching off the current. As the cross wires are welded on to the line wires there is an arrangement on the machine for carrying the fabric forward and wrapping it up into rolls of suitable diameter for transport.

Galvanized steel wire is very extensively used in the formation of woven wire fences, many methods of jointing being adopted to fasten the wires together where they cross. One of the simplest forms of fencing material is that of the chain-link order in which wires are spun together in the form of flat spirals. The manufacture of this is carried out by a very ingenious form of machine which takes the galvanized wire right from the coil and not only spins it into the form of a flat spiral, but at the same time threads it into the spiral previously formed, and after being cut off to the required length also twists the ends of the wire together. This form of chain link fabric gives not only a strong close mesh fence, but also one which is very flexible.

Wire Mattresses.—Galvanized and tinned wire is used very extensively in the construction of mattresses. For the ordinary woven mattress fine wire is run through a special forming machine which throws the wire out either singly or doubly in the shape of spirals, these being threaded together at the time of formation.

Other mattresses are made up with stronger galvanized wire in the form of links, these being put together and kept taut at the mattress frame with the aid of strong springs.

Wire-working.—The making up of wire into articles such as window guards, fire guards, cages, letter boxes, sieves or riddles, and many other forms, is a very extensive business, whilst there is no limit to the shapes wire is worked into with the many kinds

of ingenious machines which are in vogue. A great number of chains are formed from wire in which the links are automatically made, at the same time being coupled up to a former link whilst the ends of the wire are twisted up. Also, wire is used in the formation of welded chain links, machines being so constructed as to not only form the link but to bring the ends of same together and electrically weld them.

Flat wire and also wire in the form of a half-round section is used for the making of all forms of split-pinions, cotters, etc.

Wire is also used very extensively in the manufacture of not only wood screws, but also screws and bolts of many other forms, the operation and manufacture being carried out on special automatic heading machines; indeed, a good deal of the work which was formerly done in the way of hot heading is now done in the cold state in consequence of the better quality of material used and the much more highly developed machinery. Also, all kinds of rivets are made out of wire, the heads being formed in the cold state.

In addition, through the introduction of what is known as free cutting steel a great amount of turning and threading is done on wire for all kinds of articles and objects by automatic machines. It might be mentioned that free cutting steel is a steel which when cut or threaded cuts very clearly without drag, also leaving a smooth bright surface.

If the actual melting down of wire can be referred to as wire working it may be said that there is a large quantity of wire used in both oxy-acetylene and electric arc welding. Its use for these purposes covers not only the jointing up of steel plates, angles, bars, etc., but also a vast number of repairs in connection with same, and all forms of cast iron work.

Special kinds of high tensile wire are used in the formation of protective torpedo nets and similar purposes; also it is used as the stays on aeroplanes and airships, in shapes which are specially made to offer little resistance to the wind. It likewise forms the spokes of wheels for bicycles, motor-cars, etc.

It is used in the shoe, printing and cardboard-box trade very extensively for stitching purposes, and for binding it is commonly used as hay bands and as indicator protective bindings for cases containing apples and many other commodities.

In the electrical industry copper and aluminium wire is used in large quantities for conductor and other purposes, and for resisting corrosion at high temperatures special nickel-chromium wires are used as the elements in electric fires and other forms of heating apparatus; and although the name belies the statement great quantities of wire are used in connection with "wireless" apparatus, as aerials, connecting wires, coils, etc. (*See* also the articles on COPPER.) (E. A. A.)

WIRE ROPE. Although the manufacture of ropes is of ancient origin, the practice of making ropes from wire on a large scale is of comparatively recent date. Since 1874, however, great developments have taken place in the manufacture of ropes from different kinds of wire, and the uses to which they can be put have enormously increased, largely owing to the introduction of flexible wire ropes. Prior to the above date, the uses to which wire ropes were put were limited to winding ropes for collieries and to certain types of hauling. The introduction of flexibility, however, made possible the use of wire ropes for ships' hawsers and rigging, for cranes, derricks, etc., where ropes were formerly employed—indeed, wire rope has almost entirely superseded hemp for most marine uses.

Aerial Ropeways.—The introduction of aerial ropeways as a means of transportation, some 50 or 60 years ago, created a demand for steel wire ropes previously non-existent. Such ropes provide a ready means of transport over ground where it would be difficult, and in many cases impossible, to arrange for any other means. Aerial ropeways now provide a big outlet for steel wire ropes of almost all constructions.

They are constructed on two principal systems:—(1). *The Monocable System*, where one endless moving rope both supports and traverses the load. (2). *The Bicable System*, where two parallel stretches of the same heavy rope are used as tracks along which the loads are pulled by a secondary and lighter hauling rope. Of these two main systems there are many varieties, such as "The Jig-Back," "Single-side to-and-fro," etc. In the monocable system, a rope of ordinary Langs Lay construction consisting of 6 strands each of 7 wires, around a hemp core, is used. In the bicable system, a locked coil or half locked coil rope is usually employed for the rail cable, whilst for the hauling rope, a 6/7 construction Langs Lay, or alternatively a flattened strand, is most generally used. Aerial ropeways are now generally used in all mining, colliery and similar industries, as well as for a variety of other commercial purposes, thus forming a very important adjunct to the steel wire rope industry. (*See* ROPEWAYS and CABLES.)

Types of Ropes.—The flexibility of a wire rope depends upon the number of wires of which it is formed; consequently, the use to which a rope is to be put will determine, to some extent, the number of wires used in its construction. In some cases, nearly 400 individual wires are employed in the making of one rope. For the flattened strand type it is claimed that the construction gives a very greatly increased wearing surface, that the rope is more solid, and thus less likely to be crushed out of shape; it also gives a greater breaking value for its size than the ordinary round strand rope. The locked coil rope is used largely for hoisting from great depths, as guide rope in colliery shafts, and as the carrying rope in the bicable aerial ropeway; this type of rope has a smooth exterior, which minimizes wear on rope, sheaves and drum, and has the greatest breaking load possible for its size.

The following sections represent eleven different types of wire rope, some cases showing constructions of rope in which variously shaped wires are used.

A. Rope made of 6 strands of 7 wires each. This is the class of rope most frequently used for hauling ropes where the size of the barrel and sheave will permit; it is also the make of rope in general use for standing rigging, and is such as is required by Lloyds regulations.
B. Rope made of 6 strands of 7 wires each, over a triangular shaped core.
C. Hauling rope made of 6 strands, each consisting of 9 wires covering 7 smaller wires.
D. Rope made of 6 strands of 19 wires each. This type of rope is largely used for shipping purposes, running gear, trawl warps, and general engineering purposes where flexibility is desired.
E. Flexible steel wire rope made of 6 strands, each containing 12 wires arranged around a hemp centre and the 6 strands encircling a hemp heart. This is the usual make of flexible steel wire rope, 4½ in. in circumference and smaller; used for hawsers and general shipping purposes.
F. A flexible flattened strand construction used for hoisting and general mining work.
G. Extra flexible steel wire rope made of 6 strands, each containing 24 wires.
H. Special extra flexible steel wire rope made of 6 strands, each containing 37 wires.
J. Special extra flexible steel wire rope made of 6 strands, each containing 61 wires. This is the type usually adopted for large ropes (over 10 in. in circumference) used for slipway and salvage purposes.
K. A Lock Coil construction used largely for mine hoisting where a rope with no spin is desired.
L. A Lock Coil construction used for shaft guides and aerial ropeway carrying ropes where flexibility is not desired.

Breaking Loads.—The table on next page, compiled by the British Ropeways Ltd., gives particulars about wire ropes used for general purposes.

The diameter of drums and sheaves should be about thirty times the circumference of the rope. For shaft winding at high speed one-tenth of the breaking load of a rope is sometimes taken as a fair working load. For inclines, the proportion of working load to breaking load varies according to gradient conditions, and friction should be allowed for.

Manufacturing.—The first requisite in the manufacture of wire ropes is the selection and blending of the different iron ores. The different processes through which the metal passes, and the rolling into rods, require great experience. The same remarks apply to the annealing and hardening processes, in which the rods are drawn through dies to the required gauge. The wire, when it is required to be galvanized, is subjected to special processes in order that it may be proof against atmospheric and other in-

fluences. Afterwards it is wound on to bobbins of suitable size, and then a definite number of these bobbins are mounted on the forks or frames of the stranding machine. These forks are swung or pivoted between discs, which are keyed on a hollow main shaft, through which the wires or other material intended for the core pass. This core is of such a size that the aggregate number of wires mounted in the machine exactly cover it in a spiral direction. All the wires, including the centre core, are passed through their individual hollow spindles, then led to the nose or head of the machine, and finally passed through a stationary compression block to draw-off wheels. The speed of these wheels is regulated in proportion to the speed of the machine by means of suitable gearing. During the revolutions of the machine, each bobbin and fork is kept in a vertical position, and floats thus, by means of an eccentric ring behind the back disc. This ring is connected to the spindles of the bobbin fork by means of small cranks, thus preventing any torsional movement that would otherwise be imparted to the individual wires. Each bobbin is controlled by a brake which acts as a tensioning device so that equal stress can be applied to each, allowing the wires to unwind uniformly. The finished strands are wound in turn upon large bobbins, which are mounted in the flyers or discs of the rope-closing machine. These machines are similar in design to the stranding machine, but are naturally much heavier in construction, and therefore revolve at a proportionate speed. The speed of the machine varies according to the weight of the material, the size of the strands and the construction of the finished rope. The modern machine, of the type most generally used, makes about 100 revolutions per minute, whilst three times this speed is often obtained.

Cable.—The rapid strides in the use of electricity have led to another large branch of what may be termed wire rope manufacture. The ropes used for electrical purposes are almost invariably termed cables, and there are many different kinds and sizes. The wire must necessarily possess good conducting power, and be comparatively cheap. Up to the present copper has proved to be the chief material possessing these two important properties in combination; hence it is the metal *par excellence* for electrical conduction. Aluminium and alloys have been used for the same purpose. The conductor itself consists of a strand of soft copper wires, round which the dielectric or non-conducting material is placed. The methods of forming the strands do not differ essentially from those described above. The dielectric is usually paper, spun jute fibre, vulcanised india-rubber or vulcanised bitumen. If the first two dielectrics are used, a lead sheath is necessary to enclose the insulated strand and so exclude moisture; if the cable is likely to get damaged, it is further enclosed by steel tapes or steel wires, and finally covered with yarn or braid. Vulcanised bitumen is not only a dielectric, but is also absolutely impervious to moisture. Hence, in many instances where paper or fibre is employed as the principal dielectric, a sheath of vulcanised bitumen is used instead of lead to exclude moisture. Cables are also made with a single strand of copper wires in addition to one or more concentric layers of copper wires, the layers being separated by some dielectric material; or there may be two or more strands, separately insulated, and more or less elaborately clothed with the above-mentioned substances.

(T. W.)

WIRE SPRINGS. Spring making from wire is an important industry, as springs of this character are used for many purposes where resiliency is required. The functioning of safety-pins, brooches, bracelets and many other similar articles is regulated by the little spiral of wire which it contains; and the comfort of a modern bed mattress is entirely due to the small army of vertical wire springs which support the human body in any required position. It is the wire springs in elaborately upholstered furniture which give ease and comfort. Also, whilst the seating in motor-cars is made restful with wire, the engine itself depends upon springs to manipulate its valves, accelerator, brakes, etc. Indeed, the very machine which spins out the wire springs so beautifully, itself depends upon springs for the accurate movement of its parts.

Wire springs in the coiled form are sometimes cylindrical in shape as used in the seats of motor-cars, sometimes conical as used in spring mattresses, and sometimes in the form of a double cone as commonly used for general upholstering purposes.

The wire which is used for upholsterers' springs is drawn from mild steel rods of such a quality as to give the resulting wire an inherent stiffness without any form of heat treatment. But conical springs for mattresses and similar purposes are usually spun out of medium carbon steel wire which has been very carefully tempered, which not only gives it the necessary physical properties to produce resilience, but also leaves it sufficiently tough that the cut ends of the wire will stand bending around a neighbouring coil to form what is known as the "knuckle."

The manufacture of springs in the cold state from wire is a very simple operation. The wire is fed into a machine through a pair of tight fitting friction rollers, these then push it against a pair of free rollers fixed in an oblique position, which with the assistance of a guide "throw out" the coils of the spring.

Where a spring is required to be of varying diameter, it is arranged for the oblique pulleys to move in and out whilst the spring is being formed, this movement causing a variation in diameter of the coils. The same machine also carries with it a cutting device which automatically operates when the spring has been spun to its correct length.

The next operation after spinning is the setting of the spring which is carried out by slipping it over a vertical bar, pressing it flat down and allowing it to spring back. When the spring has once been crushed down flat and allowed to come back to what may be called its natural height, it usually retains that height however many times it may subsequently be squeezed down. It may be mentioned that in many cases the operation of spring setting is performed by a machine which is specially designed for the purpose.

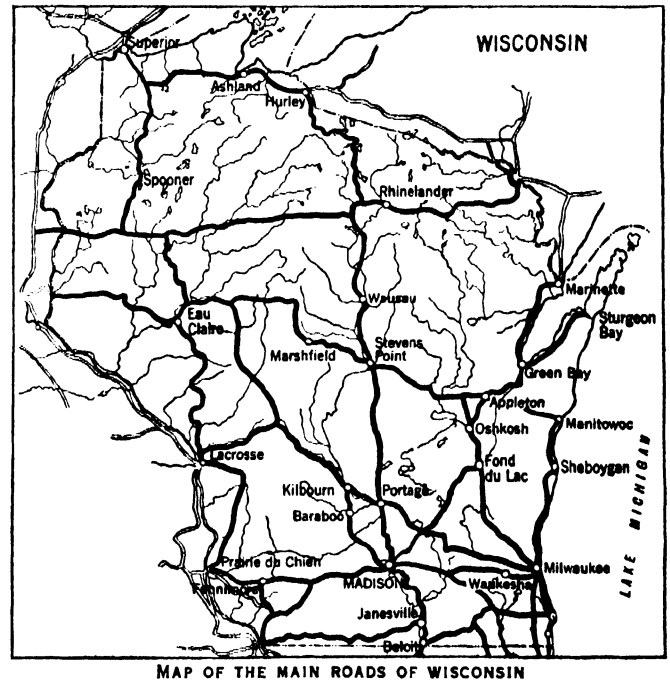
Wire springs which are used in connection with furniture or

bedding usually have the free ends bent or knuckled over the adjoining coil, this operation being carried out with a somewhat ingenious machine. The operator places the ends of the springs on to the machine which automatically grips the end of the wire and twists it tightly over the next coil. Springs which are required to be made out of rod or bar for heavy service are coiled in the red-hot condition; after which they are carefully tempered by dipping in oil or other method of heat treatment. (E. A. A.)

WIREWORM, a popular name for certain slender, hard-skinned grubs or larvae of the click-beetles or *Elateridae*, a family of the Coleoptera (*q.v.*). These larvae pass a long life (up to five years) in the soil, feeding on the roots of plants, and they often cause much damage to farm crops. A wireworm may be known by its broad, quadrate head and cylindrical or somewhat flattened body, with firm, chitinous cuticle. The subterranean habits of wireworms make it hard to exterminate them when they have once begun to attack a crop, and the most hopeful practice is, by rotation and by proper treatment of the land, to clear it of the insects before seed is sown. (*See* ENTOMOLOGY: *Economic Entomology.*)

WIRKSWORTH, market town, urban district, western parliamentary division of Derbyshire, England, 14 m. N.W. of Derby, on the L.M.S. railway. Pop. (1921) 3,610. The cruciform Church of St. Mary has traces of Norman work, but is in great part Early English, with Perpendicular additions. Lead-mining (carried on here by the Romans), stone quarrying and tape making are the chief industries.

WIRTH, KARL JOSEPH (1879–), German statesman, was born at Freiburg im Breisgau on Sept. 6, 1879, the son of a foreman mechanic. Educated at Freiburg university, he became (1908) professor of natural science at the technical college in Freiburg. In 1913 he obtained a seat in the Baden diet, and in 1914 became a member of the Reichstag. In 1919 he was minister of finance for Baden and was elected to the Constituent Assembly of the Reich. In March 1920 he succeeded Erzberger as Reichsminister of Finance, a post which he held until Feb. 1922. In May 1921 he became chancellor on the occasion of the Allied ultimatum regarding reparations, with an avowed policy of the fulfilment of treaty obligation (*Erfüllungspolitik*). In August and September of that year he came into conflict with Von Kahr, the Bavarian premier, who refused to apply to Bavaria the state of national emergency which Wirth had proclaimed consequent on the murder of Erzberger. Wirth stood his ground, and Von Kahr was compelled to resign, but two months later the decision of the League of Nations on the partition of Upper Silesia between Germany and Poland led to a widespread revolt against the policy of fulfilment and to the secession of the German democrats, including Rathenau, from the cabinet. Wirth resigned, but resumed office on Oct. 26. He then sought to establish a "Great Coalition" which should include all but the Nationalists and the Communists, but failed to secure the support of the Social Democrats, although he had obtained a measure of agreement, for the People's Party abandoned their opposition to the forced loan of a milliard gold marks and the majority socialists postponed their demand for a gold levy. But the appointment of Rathenau as foreign minister alienated the People's Party, for Rathenau, though a great industrial magnate himself, was suspected by "heavy industry" of socialist tendencies. He was unable to carry out the necessary financial measures to stop the depreciation of the mark, and in Nov. 1922, when the mark had fallen to 9,000 to the $, again resigned, and Dr. Cuno (*q.v.*) formed a cabinet to cope with the financial crisis (*Kabinett der Arbeit*). Wirth resigned from the German Centre Party in Aug. 1925, but rejoined the party in 1926, after the reaffirmation of the party allegiance to the republic.



WISBECH, a municipal borough, market town, and port in Cambridgeshire, England, on the L.N.E.R. It lies in the flat fen country, on the east bank of the river Nene, 11 m. from its outlet on the Wash. Pop. (1921) 11,321. The church of St. Peter and St. Paul has a double nave, with aisles, the north arcade being Norman; but the rest of the building is mainly Decorated and Perpendicular. There are remains of a Norman west tower; the Perpendicular tower stands on the north side. The shipping trade is carried on both at the town itself and at Sutton bridge, 8 m. lower down the river. The chief imports are coal, timber and iron, and the exports grain and other agricultural products and salt. In the neighbourhood large quantities of fruit are grown, including apples, pears, plums, gooseberries and strawberries.

By the Municipal Corporations Act of 1835 a mayor, aldermen and a council replaced the capital burgesses.

See W. Watson, *History of Wisbech* (Wisbech, 1827); N. Walker and C. Thomas, *History of Wisbech* (Wisbech, 1849); *History of Wisbech* (Wisbech and London, 1833); C. Marlowe, *The Fen Country* (1925).

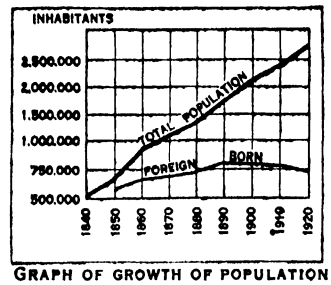
WISCONSIN, popularly called the "Badger State," is one of the North-central States of the United States. It is bounded north by Lake Superior and the upper peninsula of Michigan, east by Lake Michigan, south by Illinois and west by Iowa and Minnesota. The greater part of the western boundary is formed by the St. Croix and Mississippi rivers flowing southward. From south to north (42° 30′ N., 47° 3′ N.) the greatest length of the State is about 300 m. and from east to west (86° 49′ W., to 92° 54′ W.) its extreme breadth is about 260 miles. The lake shore boundaries on the north and east are over 500 m. in length. In area the State totals 56,066 sq.m., of which 810 are water surface.

Physical Features.—The surface of Wisconsin is generally of a rolling or undulating character, interrupted only by the sharper ridges of changing geological strata, the bluff lands along the Wisconsin and Mississippi rivers, and isolated hills and ridges of older rocks which, especially in the north-central part of the State, have thrust themselves up through the younger sedimentary rocks. Rib Hill (1,940 ft.), the highest point in the State, near the town of Wausau in north-central Wisconsin, is an elevation of the latter character. So also are the Baraboo hills, a range in the south-central part of the State. The lowest part of the State is along the shore of Lake Michigan (480 ft. above sea-level). The mean elevation is 1,050 feet. The divides which form the water sheds between Lake Superior, Lake Michigan and the

MAP OF THE MAIN ROADS OF WISCONSIN

valley of the Mississippi river and its tributaries—the three main drainage areas—are very slight. Of these areas that of Lake Superior is much the smallest. Its short, rapid streams seldom rise more than 30 m. S. of the lake shore. Of the streams flowing into Lake Michigan the Fox river (260 m.) is the most important. Rising in the south-central part of the State it flows north and east by a circuitous route through Lake Winnebago, and thence into Green bay. In its upper course it is joined from the north by Wolf river, an important tributary. The Menominee and Oconto are smaller rivers also flowing into Green bay, while

further south the Sheboygan and Milwaukee rivers empty directly into the lake. The harbours along Lake Michigan are mainly enlarged mouths of rivers.



The largest by far of the drainage areas is that whose waters flow into the Mississippi river. The Wisconsin river, the principal tributary, rises on the upper Michigan border and flows south and west for 600 m. through the heart of the State to join the Mississippi near Prairie du Chien. It is navigable for light craft as far as Portage, 200 m. from its mouth. At this point the Fox river, flowing into Lake Michigan, is but a mile to the east across low, marshy ground. The proximity of the two rivers made this a frequent route for early explorers and fur-traders travelling by canoe from the lake to the Mississippi; a canal now connects them. North of the mouth of the Wisconsin the Mississippi receives several rivers of considerable length, the most important of which are the Black, Chippewa and St. Croix, the latter forming the Wisconsin-Minnesota boundary line for 135 miles. The southern part of the State is drained by a number of streams which find their way to the Mississippi after passing into Illinois. The largest of these are the Rock, Fox (of the Illinois) and Des Plaines rivers.

Glacial ice sheets covered all but the south-western quarter of Wisconsin and greatly influenced the topography and soils. They levelled the hills, filled in the valleys and ground and mixed the soils. In the terminal moraines invaluable sand and gravel deposits were left. The glacial ice was further responsible for the thousands of lakes which not only add to the beauty of the State and serve increasingly as summer resorts but also serve to control the water flow of the rivers and prevent floods. The largest of these is Lake Winnebago with an extreme length of 30 m. and breadth of 10 m., on the banks of which are several important manufacturing cities. In the south and east portions of the State the lakes are beautiful, clear bodies of water with sandy or gravelly shores, and, as a rule, high banks heavily wooded. Many of them are famous as summer resorts, notably Lake Geneva, Green lake, the lakes in Waukesha county and the famous "four lakes" near Madison. A second group of many hundreds of lakes is found in the highland district of northern Wisconsin, chiefly in Vilas, Oneida and Iron counties. Most of these are small, but there are few portions of the world where so large a proportion of the total area is occupied by lakes. A third group, also consisting of hundreds of small lakes lying close together, is to be found in north-western Wisconsin, especially in Washburn, Burnett, Polk, Barron and Sawyer counties.

In all parts of the State, except the driftless area of the south-west, numerous large and small marshes are also to be found, many of them representing filled in or drained lake beds. The driftless area is lakeless, and has in general a much rougher topography. In its limits much of the most attractive scenery of the State is to be found. Between the Wisconsin and Mississippi valleys is the Western Upland, a plateau, ordinarily about 1,200 ft. in elevation, but dissected in every direction by tributaries of the two rivers which bound it into a succession of ridges and coulees, the former from 300 to 500 ft. above the valley bottoms. The bluffs are wooded and often capped by picturesque limestone cliffs. Originally the greater portion of Wisconsin was covered with forests, although in the south and west there were large tracts of open prairie land. In the south the predominating trees were hickory, elm, oak and poplar. Along the shores of Lake Michigan, and extending inland a quarter of the distance across the State and northward through the Fox river valley, there was a heavy belt of oak, maple, birch, ash, hickory, elm and some pine.

Climate.—The climate of the State is influenced by the storms which move eastward along the Canadian border and by those which move northward up the Mississippi valley; that of the eastern and northern sections is moderated by the Great Lakes. The winters, especially in the central and north-western sections, are long and severe, and the summers in the central and south-western sections are very warm; but cold and heat are less felt than they are in more humid climates with less extreme temperatures. The average length of time between the last killing frost of spring to the first killing frost in the fall ranges from 170 days in the south-eastern corner of the State to 75 days near the Michigan boundary. It is much longer near the lakes and along the Mississippi river. The distribution of rainfall is remarkably uniform, the mean precipitation being about 31 inches. About half the rainfall comes in May, June, July and August, the period of greatest crop growth. The average snowfall is 45 in., though along Lake Michigan and in the northern part of the State it reaches an average of 53 inches.

Population.—Since 1840, when there were but 30,945 people in the State, the population growth of Wisconsin has been remarkably uniform. The average increase for each succeeding ten-year period amounted in 1920 to 325,140 persons, and the actual increase each decade was close to this average. In 1900 the population numbered 2,069,042; in 1910 it was 2,333,860; in 1920, 2,632,067. On July 1, 1928, the census bureau estimated the population to be 2,953,000. Compared with the other States Wisconsin ranked 13th in population in 1920. The density had increased from a 42·3 per square mile average in 1910 to 47·6 in 1920. One-third of the way across the State west from Lake Michigan the population density is above the 1920 average, while in a number of counties it rises above 90 per square mile. For the greater part of the remaining portion of the State the density averages between 18 and 45 per sq.m., and in a strip of northern counties it falls below 18 per square mile. The decade 1910–20 witnessed a rapid increase in the population of the northern counties, however, amounting in a number of them to between 25 and 50%. In the same period the south-western counties registered a decrease. In rural population alone all the southern counties showed a decrease. For the State in general the percentage of people living in cities of more than 2,500 inhabitants increased from 43 in 1910 to 47·3 in 1920.

GRAPH OF GROWTH OF POPULATION WITH % OF FOREIGN BORN

A high proportion of the population of the State is of foreign origin. Of the 2,632,067 inhabitants in 1920, 1,562,244 were foreign-born or children of foreign-born or mixed parentage. The actual number of foreign-born was 460,128, a decrease from 512,569 in 1910. Of the foreign-born in 1920 over 400,000 had arrived before 1911. Many of these were original pioneer settlers and the fact that the ranks of these are being fast depleted by death accounts for the decrease between 1910 and 1920. The principal mother tongues of the foreign-born in 1920 were: German, 188,083; Polish, 52,121; Norwegian, 45,443; English and Celtic, 37,476; Swedish, 23,758. Inhabitants born of native parentage increased from 763,225 in 1910 to 1,054,694 in 1920. Negroes increased in the same period from 2,900 to 5,201. There were in addition, in 1920, 9,611 Indians, 251 Chinese and 60 Japanese.

The first wave of settlement (1824–40) in the lead regions of south-western Wisconsin was made up principally of Southerners who had ascended by the convenient Mississippi route. The next wave (1835–50) consisted of those coming west from New York, Pennsylvania, Michigan and other Eastern States who took up a large proportion of the land in the south-eastern counties of Wisconsin. After them (1840–60) came the great tide of German and Norwegian immigration. The Germans settled mainly from Milwaukee west and north to the Fox river and Lake Winnebago. The Norwegians settled in Dane and other counties of south-central Wisconsin. Swiss, Swedish, Danish, Irish, Dutch, Belgian, Austrian and Polish colonies were also soon founded. The Germans came in the greatest numbers and still total about half of the foreign stock. Of the children of foreign or mixed parentage those of German origin number 531,619 or 48·2%. Those of Norwegian origin, next in importance, number 102,385.

The population of the principal cities in 1920 (with the estimate of the Census Bureau for July 1, 1927, in parenthesis) was as follows: Milwaukee, 457,147 (536,400); Racine, 58,593 (71,300); Kenosha, 40,472 (54,600); Superior 39,671 (no estimate since population decreased between 1910 and 1920); Madi-

son, 38,378 (48,800); Oshkosh, 33,162 (33,200); Green Bay, 31,017 (35,500); Sheboygan, 30,955 (34,500); La Crosse, 30,421 (30,400). Cities with a population between 20,000 and 30,000 were: Appleton, Beloit, Eau Claire, Fond du Lac, Janesville, Manitowoc and Wausau. The fastest growing centres seem to be those situated upon Lake Michigan.

Government.—The original Constitution of the State, adopted in 1848, is still in force, though a number of amendments have been made. An amendment may be proposed by either house of the legislature, and if passed by a majority of the members of each house in two successive legislatures, it must be submitted for ratification by a majority vote of the people. A constitutional convention may be called if the proposal is adopted by a majority of the senate and assembly and voted upon favourably by the people at the following election. The legislature, composed of the senate and assembly, meets biennially in January of odd-numbered years. It may also be called into special session by the governor, but only to transact the specific business named in the governor's call. There were in 1927 100 assemblymen and 33 senators, the former chosen for two-year terms, the latter for four years.

Executive power is vested in a governor and a lieutenant-governor, elected for two years. The governor has a veto on legislation which may be overridden by a two-thirds vote of the members present in each house. The lieutenant-governor is president of the senate with a casting vote only. The administrative officers, a secretary of State, treasurer and attorney-general, are elected for two years and in *ex-officio* capacity act also as commissioners of public lands. The secretary of State is also *ex-officio* auditor. A State superintendent of public instruction is elected for a four-year term. A number of very important governing commissions have been established, the chief ones being the industrial, tax and railroad commissions. The industrial commission has control of all administration pertaining to the relations between management and labour. With the rise of Wisconsin as an industrial State, the commission has become increasingly important, and its advanced policies have challenged the attention of the economic world. The railroad commission has jurisdiction over the rates and service of railways and other public utilities. Each of the three commissions consists of three members, appointed by the governor with the consent of the senate. Other important commissions and departments are: the State highway, conservation, civil service, prohibition, free library, department of insurance, board of control, board of health, State banking department and State department of agriculture. The State geological and natural history survey and the State historical society are well-known for work done in their respective fields.

The judicial power of the State is vested in a supreme court of seven members, each elected for a term of ten years, which has appellate jurisdiction throughout the State. Two terms a year are held at Madison. There were in 1927 20 circuit courts, the court in the second circuit (Milwaukee) having six branches.

Finance.—The estimated value of all tangible property in Wisconsin according to the United States Census Bureau increased from $4,328,000,000 in 1912 to $7,866,000,000 in 1922, an increase from $1,828 to $2,899 per caput. The assessed valuation of property in 1925 for tax purposes amounted to $5,449,000,000 of which $4,077,000,000 was real estate.

Exclusive of the licence fees imposed under the police power of the State, the Wisconsin tax system consists of: (1) a general property tax chiefly for municipal purposes; (2) corporation taxes on State-wide public service companies, including street railways yielding about 10% of the taxation revenue; (3) licence taxes on the gross earnings of telephone and insurance companies; (4) an income tax, including surtaxes; (5) an inheritance tax; (6) occupation taxes on the operation of coal docks and elevators. State revenues in 1925 amounted to $36,502,000 of which $13,443,000 was derived from general and special property taxes. State expenditures the same year amounted to $31,999,000, of which $26,519,000 was for current expenditures and the remaining $5,480,000 for permanent improvements. The State debt in 1925 was only $1,864,000, or but $0.67 per caput—the per caput amount being lower than in any other State but Nebraska.

Banks in Wisconsin numbered 983 June 30, 1926, of which 158 were national banks. Their resources and liabilities totalled $1,067,969,000; their capital, surplus and undivided profits were $114,064,000; deposits amounted to $860,215,000 of which $489,951,000 were in the nature of time or savings accounts.

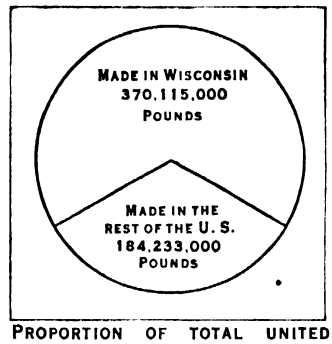
Education.—In the decade 1915–25, while the State population increased by 13%, the school census of children from 4 to 20 years increased by 9·7% and the actual school enrolment by 15·3%. In the same decade the number of high schools increased by 23%, the high school enrolment by 95% and the number of high school graduates by 115·2%. The number of high school teachers increased in the same years from 2,369 to 4,110, and the cost of high school instruction from $1,866,769 to $6,659,600, a gain of 256·7%. There were in 1926, 83 union free high schools, 7 consolidated high schools, and 399 district high schools, with 99,581 high school students. There were in 1925–26: 386,792 pupils enrolled in grade schools, 25,472 in city kindergartens and 1,421 in special city deaf and blind schools. Expenditures for the public grade and high schools amounted for the school year 1925–26 to $22,910,869. The income for the same year was $29,574,950 of which $13,459,000 was derived from district taxes. The elementary and secondary public school system is under the supervision of the State department of education, headed by the State superintendent elected for four years.

The State maintains nine normal schools which, listed in the chronological order of their establishment, are situated at Platteville, Whitewater, Oshkosh, River Falls, Milwaukee, Stevens Point, Superior, La Crosse and Eau Claire. The attendance is generally for two years, though three-year courses are given. A strong movement to provide for four-year courses had not in 1927 attained success. The administration of the normal schools is vested in a board of normal regents consisting of 11 members. By act of the 1911 legislature, Stout Institute, located at Menominee, was taken over by the State and is now supported as a training school for vocational teachers. It is administered by the State board of vocational education. The University of Wisconsin (*q.v.*) is the highest of the State educational institutions.

It is estimated that there are about 80,000 pupils of grade and high school rank in the private and parochial schools and academies. Of private institutions of collegiate rank the leading are Beloit college at Beloit, Campion college at Prairie du Chien, Carroll college at Waukesha, Lawrence college at Appleton, Milwaukee-Downer (for women) at Milwaukee, Milton college at Milton, Marquette university at Milwaukee, Northland college at Ashland.

Charities and Corrections.—The State board of control has under its control the State charitable, curative, correctional and penal institutions. It also directs the activities of other agencies related to the work of these institutions, such as the juvenile and probation departments, and has supervisory and inspectional powers with respect to county asylums for the insane, county tubercular sanatoria, county and city care of the poor, private child welfare and child placing agencies, and jails and lock-ups within the State. There are 17 State institutions under the management of this board, namely: State hospital for the insane at Mendota, Northern hospital for the insane at Winnebago, Central State hospital for the criminal insane at Waupun, Wisconsin Psychiatric institute at Mendota, Northern Wisconsin colony and training school for the feeble-minded and epileptics at Chippewa Falls, Southern Wisconsin colony and training school for feeble-minded and epileptics at Union Grove, Wisconsin State sanatorium for the treatment of tuberculosis at Wales, State tuberculosis camp at Tomahawk lake, Industrial school for boys at Waukesha, Industrial school for girls at Milwaukee, State reformatory (for males) at Green Bay, Industrial home for women at Taycheedah, State prison at Waupun, school for the blind at Janesville, workshop for the blind at Milwaukee, school for the deaf at Delavan and the State public school at Sparta.

Agriculture and Live Stock.—Wisconsin is one of the leading agricultural States of the United States. In 1925, 61·8% of the total area of the State or 21,851,000 ac. was farm land.



Of this 10,128,000 ac. was classified as crop land, 8,672,000 ac. as pasture land and 3,053,000 ac. as woodland and miscellaneous. Farm population decreased from 920,037 in 1920 (35% of the total population) to 893,352 in 1925 (31·4% of the total), but the number of farms increased, nevertheless, from 189,295 to 193,155. The average acreage of each farm decreased from 117 ac. in 1920 to 113·1 ac. in 1925. The value of all farm property amounted in 1910 to $1,618,913,000, in 1920 to $2,677,283,000, and in 1925 to $2,272,402,000 (an average of $11,765 per farm). Between 1920 and 1925 the value of farm buildings increased by $120,000,000, but farm machinery fell $21,000,000 in value and live stock $96,000,000. The greatest decrease, however, was represented in the fall of farm land values from $1,618,913,000 (an average of $73.09 per ac.) to $1,209,878,000 (average $55.37 per ac.). The highest farm land values are in the southern and eastern counties where lands average more than $100 per acre.
